| NSGACL D.1 Outline Planning Conditions | Y | - | Remains output for ERs. | Agreed* | *Planning risk is allowed within Brookfield submission although timing of response to Planning Submissions is a Board risk. | Timing of response from GCC outwith the statutory period in relation to the planning submission is a Board risk, this is dependant, however, upon the submission being correctly compiled and served by BE. That is, should a delay or cost arise due to an incorrectly compiled or served planning submission by BE that risk remains with BE. | 2009 statement remains. Planning information is contained in Folder Y of the 2010 Instruction to Proceed Project Bible. | Agreed |
| NSGACL D.2 Planning Matrix | Y | - | Remains output for ERs. | Agreed* | *Planning risk is allowed within Brookfield submission although timing of response to Planning Submissions is a Board risk. | Per above with regard to planning risk. | 2009 statement remains. Planning information is contained in Folder Y of the 2010 Instruction to Proceed Project Bible. | Agreed |
| NSGACL-Generic ADB Room Data Sheets | - | Omit | Superseded version | Agreed | | Agreed | N/C | Agreed |
| NSGACL-Generic ADB Room Data Sheets | Y | - | Remains output for ERs. | Agreed | | Agreed | ADB sheets are contained in Folder J1 of The 2010 Instruction to Proceed Project Bible. (to be read in conjunction with the Environmental Matrix plus the Environmental Matrix Report). Original 2009 ADBs to remain, to be updated and completed reflecting the Environmental Matrix + 1:50 process outcomes. | Agreed |

# This Document is 'The Clarification Log (2010 ItP) – FINAL'

| Item | Topic/Bid Reference | Board Clarification | Bidder Response | ADD | NO CHANGE / INFO | BOARD COMMENT (2009/2010 Commentary or 'NC' for No Change from 2009 Project Bible position) |
|---|---|---|---|---|---|---|
| Technical Clarification 1 | | | | | | |
| **General** | | | | | | |
| 0.0 | | | | | | |
| **Logistics** | | | | | | |
| 1.0 | Site Parking | You have options but no firm plans for site parking, please confirm that the provision for site parking (incl any delivery area/holding area/lay-down areas off site) for all phases are included in your priced bid. | Brookfield have considered a number of options with regards to temporary parking/holding areas etc during the construction period and should we be selected would wish to discuss with the Board and other interested parties these arrangements to develop a strategy for the benefit of the Project. In the meantime, we confirm our prelims identify pricing allowances for the relevant Stages and refer you to the logistics section. In addition, our procurement strategy with regards the supply chain will include for the provision of temp parking spaces and this will be identified in the cost when packages are let accordingly. I.e. the amounts in the Prelims will be supplemented by amounts in the trade cost plan. We also recognise that using local labour will enable us to encourage the use of public transport to mitigate the requirement for extensive on site/off site temporary parking. Finally whilst we identified on the risk register temporary parking as being an issue to resolve, we felt a combination of the above will be sufficient to deal temporary parking and this reduced the risk element to acceptable. | | NC | **2009 Project Bible**<br>Brookfield have identified options for car parking as well as the associated cost allowance (£220,000). A decision on which option will be taken up to be made post-contract<br><br>**2010 ItP Project Bible**<br>Work in Progress Logistics details and proposals to be monitored and developed through Stage 3 between the Board and BCL. All off site/logistics activity to be discussed, presented and agreed with the Board prior to commencement of any activities. |
| 2.0 | Delivery Team | Several of your proposed delivery team appear to have commitments to another healthcare scheme (i.e. Peterborough). Please confirm how your delivery team will be deployed in line with the NSGH timescales and your programme requirements. | We reaffirm our commitment that the proposed delivery team will be deployed in accordance with the NSGH timescales and our programme requirements. Taking each stage:<br><br>- Labs Construction Team:<br>The individuals noted are available now, and no longer have commitments on Peterborough.<br><br>- FBC/Core team:<br>The individuals are available now, and have already been working on the NSGH project.<br><br>- Adult/Children's Team:<br>The individuals identified will be available before November 2010. At Peterborough, the Mental Health Unit and City Care Centre have already been completed on programme and handed over to the Trust earlier this year. This has released some of the individuals who have since being involved in the bid submission. The main Acute facility is 3 months ahead of programme and notice will be given shortly to confirm the end of September 2010 date for handover. Many departments are being closed off progressively (as some of the Board's team will have witnessed during the recent site visit). By the end of 2009, the Acute facility will be into testing and commissioning phase and we are confident that a September 2010 completion is likely and the individuals will be available as scheduled. | | NC | NC |

| | | | | | | |
|---|---|---|---|---|---|---|
| **Design/HP** | | | | | | |
| 3.0 | Entrances | Confirm your proposals for significant entrances to the site per ER requirement in this regard. | The NSGH campus masterplan has been configured to provide clear entrances which lead directly to the primary arrival space at the heart of the campus. Entrances have been designed in plan form to provide the necessary function and capacity to respond to highway requirements associated with the various modes of transport. Significant entrances are to be delivered as features within the context of both the wayfinding and public art strategies. The entrances are important as part of the legibility and identity of the rejuvenated hospital campus. To achieve this it will be necessary for the design team to work with the Board to determine the correct balance between an innovative and unique site-specific response (informed by public art) and the guidance for standardised signage contained within the NHS Scotland guidance for signage and branding for use within NHS sites (which we have reviewed). For this reason our designs have not been developed beyond the concept stage in advance of Stage 2 engagement. The attached concept images illustrate the general potential for an entrance feature sign at the primary Govan Road entrance to<br>the site, but should not be considered a firm design proposal at this point. We can confirm that the commercial proposal includes provision for this approach.<br><br>Our drawing GIL-WS-00-PL-502 illustrates the signage hierarchy and proposed locations for the various sign types. This includes the proposed location of campus gateway signage features at the key entrances to the campus. It is intended that the main entrances should include feature lighting as part of the significant entrance features. It should be noted that the entrances need to be considered in parallel with the design and quality of the main arrival square, as this forms an important part of the entrance and arrival sequence and experience. The point of entrance and the route to the arrival square should therefore be considered as part of the entrance arrangement. | | NC | NC |
| 4.0 | Specification | Confirm your proposals for electronic information points per ER requirement (7.15.4) in this regard. | In response to the ER requirement (7.15.4) we have made provision for 1x 'Real Time Public Transport System' electronic Information Point externally at the Bus Drop-Off Area.<br><br>Additionally, in response to ER requirement (7.2.19), as part of our Wayfinding Strategy we have proposed electronic/interactive 'You Are Here' maps in the Main Entrance Foyers to both the Adult and Children's Hospitals.<br><br>Please refer to our Wayfinding Strategy contained within **Volume 3.0; Section 3.2** for further details of our proposals and imagery. | | info | Agreed that real time will only be provided if supported by transport system. |
| 5.0 | Interstitial Blinds | Confirm your strategy for interstitial blinds to external windows/façade and internal observation screens (this to include a cross-section detail of your proposal(s)). | Interstitial Blinds have been included in our priced bid to **internal** glazed screens generally to all Bedrooms, including those within Critical Care (Adult Hospital and Children's PICU), AAU and all Inpatient Wards (Adult and Children's Hospitals).<br>In addition, interstitial blinds have been included to internal door vision panels as part of our Internal Door detailed proposals. Our Internal Door Strategy is contained within the Introduction to<br>Volume 2.0; Section 2.21<br>- Door & Ironmongery Schedules. Where a door is noted in the Schedule as being<br>'obscurable'<br>, this equates to a vistamatic type vision panel with interstitial | Y | | Interstitial blinds are also included for all external windows. |

| | | | | | | |
|---|---|---|---|---|---|---|
| | | | blinds.<br><br>Please note that our priced bid does not currently have a provision for internal blinds or curtains which are not integral to the internal fabric of the building. In our past experience these items would be included in the Equipment List. We have priced this List accordingly as requested by the Board, and would be pleased to debate with the Board further whether these items should be included within the Equipment List.<br><br>With respect to **external** windows, we have included for interstitial blinds to all external windows in patient areas within Critical Care (Adult Hospital and Children's PICU).<br><br>Again, please note that our priced bid does not currently have a provision for internal blinds or curtains which are not integral to the internal fabric of the building.<br><br>Please refer our separate attachments for the requested detailed section drawings, our Internal Glazed Screen Strategy Document and External Windows Privacy Strategy Document. | | | |
| **M&E Services** | | | | | | |
| 6.0 | | | | | | |
| **Renewables/Sustainability/BREEAM** | | | | | | |
| 7.0 | Carbon | You noted at the presentation of 21 September you're your variant 2 for Laboratories will achieve the 80Kg CO2m2 – can you confirm that your compliant bid achieves this target also. | Achieving the 80kg CO2 m2 for both the compliant and Variant Option 1 Laboratory bid will be dependant on the construction of the Energy Centre, with which the overall solution is integrated. **RFI 144** refers and is attached for ease of reference.<br><br>As noted in **RFI 147** (attached) the Energy Centre is dependant on FBC and commencement of Stage 3.<br><br>Variant Option 2 offers an integrated M&E plant solution and the early construction of the Energy Centre shell and core to house it. This may be achieved through an advanced design and planning process and cash flow solution indicated in Volume 16 of our bid submission. | | info | Note that stand alone Labs does not achieve 80kg $CO_2/m^2$ |
| 8.0 | BREEAM | Clarify BREEAM Ene 1 score – 8 and 11 referred to in different sections. | Please note the correct score is 8 and we apologise for the confusion. | | info | NC |
| 9.0 | Renewables | Confirm which LZC and renewables are included in the bid. | LZC –<br>3MW Combined Heat and Power units.<br>High efficient friction less bearing chillers providing COP 9.<br>1000kW Absorption chiller unit.<br>Active chilled beams.<br>Variable speed pumps.<br>Natural daylighting.<br>Natural ventilation.<br><br>Renewables.<br>12no Vertical axis wind turbines. | Y | | NC |
| 10.0 | Energy Model | Confirm that the energy model is fully compatible with the servicing strategies set out in volume 3 in particular the use of a sealed building with chilled beams. | Brookfield confirm the energy model is fully compatible with the requirements as set out in Volume 3 in particular the use of sealed building with chilled beams. | Y | Info | Refer to Sustainability and Energy Issues |

| | | | | | | |
|---|---|---|---|---|---|---|
| 11.0 | Energy Monitoring | Confirm that the energy monitoring system illustrated is included in the bid. | Brookfield confirm the energy monitoring system is included in the bid. | | Info | **2009 Project Bible**<br>Refer to M&E Clarification Log in Contract Data Part 1for confirmation of position on building metering<br>**2010 ItP Project Bible**<br>Energy monitoring per 2009 proposals, with design being developed in this regard during Stage 3. |
| 12.0 | Energy Management | Has active energy management been included for by BE post construction as per clarification? | Brookfield confirm we will provide active monitoring, reporting and fine tuning during the 24 months DLP period. Please refer to our Volume 3 Sec 3.24 Item 1 Building Services Commissioning Strategy, Post Occupancy DLP Period for further information. | Y | | NC |
| Item | **Topic/Bid Reference** | **Board Clarification** | **Bidder Response** | | | |
| Technical Clarification 2 | | | | | | |
| **General** | | | | | | |
| 1.0 | Bid Return Section 5 – Component / Product & Manufacturer Schedule | Noted that M&E related items do not appear in Section 5.<br><br>Clarification required of M&E component/product and manufacturers as well as (for all elements) that listed names will be utilised or "equal and approved" component/product manufacturers. | Full component schedule is as detailed in ***Appendix Q1*** attached<br><br>This indicates the quality of manufacturers proposed for components / products | | | **2009 Project Bible**<br>Component manufacturer Schedule<br><br>Agreed Schedule Included in Volume 5 of the Contractor's Proposals contained in Contract Data Part 1.<br>**2010 ItP Project Bible**<br>Updated agreed Component List located in Folder H1 of The 2010 Instruction to Proceed Project Bible. |
| 2.0 | Bid Return Section 7 – SHTM Compliance | **Mandatory Section** – clarification is required with regard to the following items:<br><br>**SHTM85 and SHTM86** – these are relevant as the design joins the existing hospitals, what are the proposals to comply in this regard.<br><br>**Health and Safety Action Notices (HSANs)** – require to confirm will comply with rather than "with reference to".<br><br>**NHSE10 and SN(01)01** – confirmation that anti-ligature is included in A&E as well as DFCP.<br><br>**NHSE HN04** – confirmation that anti-ligature is included in A&E as well as DFCP. | Full clarifications have been provided in the attached ***Q2 Appendix*** | | | **2009 Project Bible**<br>Compliance to be as per tables in Volume 7 of the Contractor's Proposals contained in Contract Data Part 1. |

| | | | | | | |
|---|---|---|---|---|---|---|
| | | **SFPN3** – clarification required of how compliance with updated document will be achieved/documented.<br><br>**SHTM2010** – confirmation required that design will comply with rather than "with reference to".<br><br>**SHTM2003** – notes that the services follow the principles set down in the HTM – clarification of compliance with the SHTM required (and specifically compliance with the services dimensions to be provided).<br><br>**SHTM2024 Part 4** – confirmation required that original maintenance provisions are included and priced in the bid. | | | | **2010 ItP Project Bible**<br>Original 2009 SHTM listing remains and is located in Folder i1 of The 2010 Instruction to Proceed Project Bible. Any agreed alternative compliance is contained in either The 2010 Instruction to Proceed Log located in Folder S of The 2010 Instruction to Proceed Project Bible or the accepted 1:500 and 1:200 (general arrangement) departmental layouts (Appendix K).<br><br>The above is subject to the proving of clinical functionality in affected rooms/areas, per the narrative in relation to Volume 1 of the Contractors Proposals in the (Appendix 2 & 3) 'Notice to Proceed' letter signed by the Parties. |
| 3.0 | Bid Return Section 7 – SHTM Compliance | Where no specific options have been listed in your bid return (ref ERs 5.2.3) clarify that all options remain available to the Board with no additional costs to the Board. | We have endeavoured in our bid submission to confirm in detail the basis of our design, specifications and cost plan. To avoid uncertainty these proposals need to take priority over the various options given in the various documents scheduled in tables 2 and 3 of the ER's.<br><br>We are however conscious that within the various documents there are options that the Board may feel would enhance the scheme and assist in producing an exemplar facility. We are more than happy to review any options with the Board, within the confines of the cost plan, to ensure that the optimum solution is adopted across the project" | | | **2009 Project Bible**<br>Compliance to be as tables in Volume 7 of the Contractor's Proposals contained in Contract Data Part 1.<br><br>**2010 ItP Project Bible**<br>Original 2009 SHTM listing remains and is located in Folder i1 of The 2010 Instruction to Proceed Project Bible. Any agreed alternative compliance is contained in either The 2010 Instruction to Proceed Log located in Folder S of The 2010 Instruction to Proceed Project Bible or the accepted 1:500 and 1:200 (general arrangement) departmental layouts (Appendix K).<br><br>The above is subject to the proving of clinical functionality in affected rooms/areas, per the narrative in relation to Volume 1 of the Contractors Proposals in the (Appendix 2 & 3) 'Notice to Proceed' letter signed by the Parties. |
| **Logistics** | | | | | | |
| - | - | No items in this TC. | | | | |
| **Design/HP** | | | | | | |
| 4.0 | H+S Landscape | Courtyards – clarify what is intended by white gravel? | The white gravel is a aesthetic material used in geographical arrangements producing dramatic patterned landscapes when viewed from above. This material can be laid loose or bound to correspond to the courtyards function. Please refer to drawings GIL-WS-00-EF-S04 Courtyard Design Intent. ***See Appendix Q4-7 attached*** | Y | | NC |
| 5.0 | H+S Landscape | Aside from the separately identified therapy courtyards is there any access or intended function for the remaining courtyards indicated? | The other courtyards have the potential to be accessed depending on the adjacent hospital departments, to be developed further with the board. Please refer to drawings GIL-WS-00-EF-S04 Courtyard Design Intent<br>***See Appendix Q4-7 attached*** | Y | | NC |
| 6.0 | H+S Landscape | External Works Layout Dwg No. CD-WS-00-PL-711-01 indicates concrete blocks to the front of the hospital. The masterplan Dwg No. GIL-WS-00-PL-100 indicates exposed aggregate concrete paving. The Outline Specification for roads, car | The palette of materials has been selected to provide a cost effective high quality environment. Natural granite is proposed to the entrance thresholds with concrete pavers with exposed granite aggregate proposed to the arrival square. Please refer to drawings GIL-WS-00-EF-S05 Arrival Square Pavement Design intent | Y | | NC |

| | | | | | | |
|---|---|---|---|---|---|---|
| | | parks, pavements and cycle paths suggests paving in these areas will be natural stone granite. Can we clarify actual proposals for these areas? | ***See Appendix Q4-7 attached*** | | | |
| 7.0 | H+S Landscape | The drawings indicate a limited number of bike shelter locations (2No.)? Is this correct or are other bike shelter locations intended? | The two cycle shelters shown on the master plan are key structural features place near the main entrances, other cycle stands are located throughout the site in key location. Please refer to drawings GIL-WS-00-EF-S06 Cycle Parking Strategy and GIL-WS-00-PL-115 Vehicle Movements- Cycles<br>***See Appendix Q4-7 attached*** | Y | | NC |
| **M&E Services** | | | | | | |
| 8.0 | M&E Services | Please indicate any deviations from M&E elements of the ER's. | The following deviations are proposed:<br>• UPS autonomies proposed are compliant with SHTM 06-01 and differ in some respects from the ERs. | | | **2009 Project Bible**<br>Refer to the RFI Log in Contract Data Part 1<br>**2010 ItP Project Bible**<br>Refer to the RFI Log (2010 ItP) in Folder B1 of The Instruction to Proceed Project Bible. |
| | | | • The proposals for automatic lighting controls as described in Volume 3 Section 3.12 and Volume 4 Section 4.3.6 differs in some respect from the ERs. | | | **2009 Project Bible**<br>Refer to the RFI Log in Contract Data Part 1<br>**2010 ItP Project Bible**<br>Refer to the RFI Log (2010 ItP) in Folder B1 of The Instruction to Proceed Project Bible. |
| | | | • A single energy centre is proposed split into two plant spaces with 4 hour fire separation to provide the resilience of two separate energy centres. | Y | | Agreed |
| | | | • N+1 has not been provided to all plant as noted in Volume 2/1 Clause 8.1.1.17. N+1 has been included to all energy source plant, pumps, heat exchangers and duplicate motors provided on air handling plant. | | | **2009 Project Bible**<br>Refer to the M&E Clarification Log in Contract Data Part 1.<br>**2010 ItP Project Bible**<br>Refer to the M&E Clarification Log (2010 ItP) in Folder B1 and The 2010 Instruction to Proceed Log in Folder S of The Instruction to Proceed Project Bible. |
| | | | • Dual path distribution has not been provided on all systems as this would be impractical for piped systems and specialist electrical systems, e.g fire alarms. Supplies from the energy centre have an element of duplication for resilience and electrical power distribution has A & B separation throughout using diverse routes wherever possible. | | | **2009 Project Bible**<br>Refer to the M&E Clarification Log in Contract Data Part 1.<br>**2010 ItP Project Bible**<br>Refer to the M&E Clarification Log (2010 ItP) in Folder B1 and The 2010 Instruction to Proceed Log in Folder S of The Instruction to Proceed Project Bible. |
| | | | • Bulk water storage has been based on the busiest 12 hour period rather than 24 hour as suggested in volume 2/1 clause 8.2.8.2. It is considered that with duplicate incoming water mains to the site a reduced water storage capacity will reduce the risk of legionella. | | | **2009 Project Bible**<br>Refer to the M&E Clarification Log in Contract Data Part 1.<br>**2010 ItP Project Bible**<br>Refer to the M&E Clarification Log (2010 ItP) in Folder B1 of The Instruction to Proceed Project Bible. |
| 9.0 | M&E Services | Please confirm that racks will be provided for Client's active equipment. | The following allowances have been made:-10 racks in each of the adult's and the children's hospital main comms rooms, and<br>2 racks in each hub room | | | Deviation from ER's not accepted<br><br>The ER's requirement noted below, is agreed as included and to be provided by the Contractor |

| | | | | | | |
|---|---|---|---|---|---|---|
| | | | | | | C1-C6 External comms<br>S1-S10 Board servers<br>E1-E8 General board equipment.<br>B1-B6 contractors equipment including patching BMS CCTV raid etc.<br>3 racks in each hub room |
| 10.0 | M&E Services | Please confirm that BMS IP network will be fully stand alone and that all active equipment has been included. | Yes | | NC | NC |
| 11.0 | M&E Services | Please confirm that asset tagging system has been included and that all services equipment shall be tagged. | Included | | NC | NC |
| 12.0 | M&E Services | What function does scaffolding platform have in plant replacement strategy for transformers and generators. | The scaffolding platform allows a level surface for the equipment to be withdrawn from the plant space and craned off to ground level | | info | **2009 Project Bible**<br>Plant replacement strategy for large items requires to be further developed in Stage 2<br>**2010 ItP Project Bible**<br>Design development progressing during Stage 3 for this item. |
| 13.0 | M&E Services | Confirm that reference to BOC should be "Air Products". | Yes | | info | NC |
| 14.0 | M&E Services | Please provide luminaire details to supplement pictorial views | Refer to separate document outlining details<br>***See Appendix Q14 attached*** | Y | | NC |
| 15.0 | M&E Services | Please confirm light switches will be selected to suit lighting control system. | Yes | | NC | NC |
| 16.0 | M&E Services | Please confirm that bedside adjustable luminaires will be a modern low energy high output units. | Yes | | NC | NC |
| 17.0 | M&E Services | Please confirm fire alarm PC includes incident location graphics. | Included | | NC | NC |
| 18.0 | M&E Services | Please confirm that 4 CHP units have been proposed as the narrative (schedule indicates 3). | Three CHP units are proposed | | info | NC |
| 19.0 | M&E Services | Television outlets on equipment schedule (are these back up for the CAT6A for digital distribution via the patient entertainment system? | YES, This allows flexibility and future proofing | | info | NC |
| 20.0 | M&E Services | Please provide details on the proposed patient entertainment systems. | Refer to supplementary schematic MER-XX-XX-SM-1400-001 outlining details<br>***See Appendix Q20 attached*** | Y | | **2010 ItP Project Bible**<br>~~ER requirement stands, supplementary schematic for information, further specific details to be provided by BCL for Board review as design development.~~<br>NC |
| 21.0 | M&E Services | Please advise how Renal & Specialist Departments water temperature requirements will be achieved. | This system will interact with the BMS which monitors the temperature and, if required, dumps RO water from the circulating loop to maintain optimum temperature conditions. A heat sanitise cycle is also allowed for. | Y | | NC |
| 22.0 | M&E Services | Confirm reference to 5A Switches equipment schedule should be 20A. | Confirmed | | NC | NC |
| 23.0 | M&E Services | Please confirm that metering will be provided to meet BREEAM requirements. | Yes | | NC | NC |
| 24.0 | M&E Services | Please advise proposals for water spillage protection from fan coils in secondary comms room. | Drip drays and leak detection | Y | | **2009 Project Bible**<br>Positioning of leak detection to be included in design development |

| | | | | | | |
|---|---|---|---|---|---|---|
| | | | | | | See Item 34 Appendix B<br><br>**2010 ItP Project Bible**<br>Refer to the 2010 Instruction to Proceed Log located in Folder S of The Instruction to Proceed Project Bible for details of leak detection. |
| 25.0 | M&E Services | Please confirm compliance with maintainability and area isolation requirements. | Maintainability and area isolation will be incorporated in the design to give compliance. Individual rooms will have isolation of components such as sanitary ware and terminal heating/cooling devices. It will not be possible to isolate each individual room for lighting and power. It will be possible to isolate each individual circuit, and with each room having at least two circuits the room will continue to function | | | Design to achieve ER's including 8.1.5.2 (c) and 8.1.5.4. (see note below with regard to treatment of and agreed position in relation to 8.1.5.4) |
| 26.0 | M&E Services | Please confirm that the renal Central Concentrate Delivery system is included (adult hospital). | Yes | | Info | NC |
| 27.0 | M&E Services | Please confirm that all services comply with HAI – SCRIBE. | The Services Engineer will be part of the overall SCRIBE team along with the Board's Infection Control Manager, Clinical Advisers, Facilities Manager, and Departmental Representatives, plus the other members of the design team and other relevant specialists. The Services Engineer will discharge the duties as set out in HAI-SCRIBE Implementation Strategy | | info | NC |
| 28.0 | M&E Services | Please confirm that all plant and equipment will be suitably isolated to prevent transmission of noise and vibration. | Yes | | info | NC |
| 29.0 | M&E Services | Please confirm that full environmental proving off all rooms will be provided. | Yes | | Info | NC |
| 30.0 | M&E Services | Please confirm that all metering requirements will be provided in accordance with the ER's and BREEAM requirements. | Yes | | NC | NC |
| 31.0 | M&E Services | Please confirm that all services elements are included to meet the fire engineering solution, e.g. stair pressurisation, smoke control etc. | Yes | | Info | NC |
| 32.0 | M&E Services | Please confirm that ICT cooling has been included and provide details. | Yes, this is achieved with a chilled water solution, via crac units and fan coil units, as appropriate. | | Info | NC |
| 33.0 | M&E Services | Please confirm that specialist drainage has been included. | Included | | Info | NC |
| 34.0 | M&E Services | Please confirm that leak detection has been included. | Included | | Info | NC |
| 35.0 | M&E Services | Please indicate percentage capacity of all water service pipework mains from the energy centre to the main buildings for resilience. | The A and B circuits are sized for 66% of the maximum operational load. The A & B circuits from the energy centre are primary circuits and totally isolated from the secondary plantroom circuits via the plate heat exchanger units. It is envisaged that any routine maintenance | Y | | **2009 Project Bible**<br>Refer to the M&E Clarification Log in Contract Data Part 1.<br><br>**2010 ItP Project Bible**<br>Refer to the M&E Clarification Log (2010 ItP) in Folder B1 and The 2010 Instruction to Proceed Log in Folder S of The Instruction to Proceed Project Bible. |
| **Renewables/Sustainability/BREEAM** | | | | | | |
| - | - | No items in this TC. | | | | |
| **Laboratories** | | | | | | |

| | | | | | | |
|---|---|---|---|---|---|---|
| 36.0 | Laboratories | The Values on Labs Summary Page for Overhead and Profit do not correspond with % values provided on Stage 1 or Incoming Utility Costs Associated with Stage 1. | This is Correct. The figures are calculated by adding 6.2% plus an apportioned value for overhead recovery. | | | **Laboratories item – does not form part of the 2010 Instruction to Proceed data.** |
| 37.0 | Laboratories | On Labs Final Summary Page (Page 4 of Submission) £281,552.00 in included for Additional Fee and Profit on Max Cost. If you apply the %'s from elsewhere on the page this value would be approx £43K less? | Unlike the way the Board have asked us to submit the MPTC Calculator Brookfield methodology for calculating Overhead and Profit is by taking this amount against Prime Cost excluding Fees which actually means that in the case of the Laboratory Building the gross margin on Prime Cost is circa 7.5% and thus provides the number given. | | | **Laboratories item – does not form part of the 2010 Instruction to Proceed data.** |
| 38.0 | Laboratories | Can you confirm extent of tunnels included within Stage 1 Section | The bid is based upon the URS and BMJ drawings issued under addendum 34. The basement and tunnels are reduced for the variant option and are as detailed within our Volume 13 of the bid.<br>The extent of tunnels are as per the BMJ demarcation lines identified on the above BMJ drawings | | | Brookfield require the route of the tunnels to be reviewed to ensure that the Labs building and the Adult and Childrens Hospital align. There is currently a mismatch in propose routes that needs to be resolved<br><br>**Concluded** |
| 39.0 | Laboratories | No evidence of anything noted as "Provisional". Please confirm or provide detail of items to be considered as Provisional. The Bills make reference to "general assumptions". Please confirm that they are not to be considered provisional. | There are no provisional items within the cost plan | | | **Laboratories item – does not form part of the 2010 Instruction to Proceed data.** |
| 40.0 | Laboratories | Substructure: Please confirm what exactly the £100k allowance is for fire escape and stairs includes for. | Fire strategy requirements dictate that an escape tunnel and stair will be required from the basement tunnel that is not currently indicated by BMJ or URS drawings.<br>Cost allowance included is based on similar staircase and concrete enclosure to adult basement tunnel. | | | **Laboratories item – does not form part of the 2010 Instruction to Proceed data.** |
| 41.0 | Laboratories | Substructure: Allowance has been included for 14 Nr lift pits. Please confirm Nrs. Current drawing shows 12 Nr FF, goods & staff Lifts and 4 Nr lifts in connection with Robotics. | Confirmed, all lift pits are as detailed on the drawings are covered either in this specific item or in general substructure measurement. | | | **Laboratories item – does not form part of the 2010 Instruction to Proceed data.** |
| 42.0 | Laboratories | Upper Floors: Please confirm all allowances for recesses or thickening of slabs is included. | Confirmed, included in rates | | | **Laboratories item – does not form part of the 2010 Instruction to Proceed data.** |
| 43.0 | Laboratories | Stairs: Number of assumptions/clarifications: Design team to appraise/comment to facilitate in the removal from pricing docs. | No assumptions made in Cost Plan | | | **Laboratories item – does not form part of the 2010 Instruction to Proceed data.** |
| 44.0 | Laboratories | Ext Walls: Please identify where Spec item 1.12 (louvers to office block) appear in your bid. | Allowance taken in copper cladding section. | | | **Laboratories item – does not form part of the 2010 Instruction to Proceed data.** |
| 45.0 | Laboratories | Ext Walls: Ext brise soleil system included. Not stated as being required on previous dwgs. | Builders work drawings received 24th August show indication of Brise Soleil and we have based our provision on this. | | | **Laboratories item – does not form part of the 2010 Instruction to Proceed data.** |
| 46.0 | Laboratories | Windows: Window sizes do not tally with C&B's original measure | Window are measured from the latest issue drawings as opposed to original C&B measure | | | **Laboratories item – does not form part of the 2010 Instruction to Proceed data.** |
| 47.0 | Laboratories | Ext Doors: Please advise where Revolving entrance doors are included. | Taken in External Walls section of Cost Plan | | | **Laboratories item – does not form part of the 2010 Instruction to Proceed data.** |

| **Design/HP** | | | | | | |
| 2.0 | Energy Centre | Please confirm the location in your compliant bid the Energy Centre Layout plan reflecting the retention of the Stage D Laboratories design. | We would enclose drawing NA-EC-00-PL-251-020 that shows the energy centre from our masterplan located against the stage D laboratory design.<br><br>There is some flexibility with regard to the plan location that would require BMJ input should our bid prove to be successful.<br><br>The laboratory stage D design shows all main plant within the laboratory building plant rooms, which enables the laboratory building to operate stand alone.<br><br>The compliant bid for the Energy Centre does allow for some plant in the current designs; namely Standby Generators and Boiler capacity as detailed in Volume 3 Sections 3.8 & 3.10 and Volume 4 Section 4.55. | | | Subject to Development in Stage 2<br><br>**Concluded**<br>(Illustrated on Planning Consent Drawings MSC1 and 2) |
| **M&E Services** | | | | | | |
| - | - | | - | - | | |
| **Renewables/Sustainability/BREEAM** | | | | | | |
| 3.0 | - | Please confirm that your compliant laboratory scheme will achieve BREEAM Excellent. | Our assessment of the compliant stage D design BREEAM rating is 65 which achieves very good but falls 5 points short of an excellent rating. The main reason for this shortfall is the difficulty in achieving the energy target of 80kgCO2/m2 without linking the laboratory building to the energy centre as confirmed in the Board response to RFI144.<br>There are a number of other options that could be looked at to improve the BREEAM rating such as reduction in CO2 emissions, limiting water consumption etc. These are not currently part of the compliant scheme. | | | **Laboratories item – does not form part of the 2010 Instruction to Proceed data.** |

| 1.0 | Schedule of Accommodation | Clarity is required with regard to your Schedule of Accommodation. The attached Appendix A identifies the area assessment presently (in column C). Please identify each actual figure in the column D 'Confirmation' listing to reflect the following (with item 3 provided separately):<br><br>1. **Gross departmental area** (including planning and engineering and departmental circulation) for each department and the total for each hospital<br>2. **Net departmental area** (sum of net as drawn/designed rooms only) for each department | Please find attached the completed Appendix A which has identified the actual area figures requested to be clarified in column D 'Confirmation'.<br><br>We have assumed the 'Y' noted against Section Number 1 is the Board's acceptance that this information has already been provided by Brookfield in Volume 1; Sections 1.1, 1.2, 1.3, 1.4 of our Bid Submission.<br><br>In addition, please note that the Total Gross Floor Area noted in our submission did not include the % Planning allowance. This SOA was generated by Codebook, and was an accurate 'As Drawn Area' which excluded the thickness of | | | **2009 Project Bible**<br>Refer to the agreed SoA 1:200 Drawings and related requirements contained in Volume 1 of the Contractors Proposals in Contract Data Part 1 and to the narrative in this regard contained in the signed Appendix 2 and 3 Instruction to Proceed (see Volume 1 of the Contractor's Proposals). |

| | | | | | | |
|---|---|---|---|---|---|---|
| | | and the total for each hospital<br>3. **Net room areas** (excluding all ducts, pipe boxing and service zones) listed room by room and by department<br>4. **Circulation area** (departmental) for each department and the total for each hospital<br>5. **Communications and plant areas** (interdepartmental circulation horizontal and vertical and main plant rooms and risers) for each hospital<br>**Total gross floor area** for each hospital. | the internal partitions. This has now been included in the completed Appendix A. These figures represent the GIFA which has been priced and included within the Cost Plan. | | | **2010 ItP Project Bible**<br>Refer to the agreed SoA 1:200 Drawings and related requirements contained in Volume 1 of the Contractors Proposals in Contract Data Part 1 and to the narrative in this regard contained in the signed Appendix 2 and 3 Instruction to Proceed (see Volume 1 of the Contractor's Proposals). |
| 2.0 | MRI replacement | Please confirm your proposals (methodology, routes and structural provision to support) the replacement/retro fit of MRI equipment. | In the absence of specific MRI product information, the building footprint areas identified on the plans as housing MRI installations have been checked against a 7.5 tonne magnet installation (example from a recent comparable project).<br>In each case it was noted that the floor and foundation structures as currently presented could be appropriately detailed to facilitate the incorporation of this equipment.<br>The proposed transit route for the MRI installation is not known but is expected to be either through double access doors at ground level, along corridors and possibly via a wall knock-out access panel into the proposed room. Alternatively, the MRI unit could be delivered to the FM area and transported via the service tunnel to a lift and then to the corridor etc as above. The floor and foundation structures for the possible routes noted above have been checked against the 7.5t load and noted to be able to be appropriately detailed to facilitate the incorporation of this equipment.<br>The final location of any such equipment will require to be specifically checked against the details of the actual equipment proposed. | | | This will be subject to Design Development Review<br>Allowance based upon 7.5t MRI load<br><br>**MRI Concluded** |
| **M&E Service** | | | | | | |
| 3.0 | M&E Services | Please confirm pipework types for DH&CW, CHW and heating. | For DH&CW pipework, Stainless Steel Mapress by Gilbert (or equivalent) is proposed up to 67mm dia. And an ABS type material will be used on sizes above this. Copper will not be used on these systems.<br>For CHW & LTHW, carbon steel galvanised Mapress by Gilbert (or equivalent), Large bore, mild steel medium grade tube, Victaulic mechanical couplings (or equivalent).<br>For MTHW mild steel heavy grade tube fully welded/flanged. | | | Agreed stainless steel throughout.<br><br>(Any alternate compliance/product to be submitted to the Board for review. To be taken to VE forum). |
| 4.0 | M&E Services | Please provide more clarity (detail) with regard to your proposed lighting controls. | A mixture of automatic 'absence' and 'presence' detection will be provided.<br><br>Presence detection: detector switches lighting on and off.<br>Extent of provision: intermittently occupied areas such as WCs, en suites, corridors, ward kitchens, stores, plant rooms, services risers, hospital streets, bathrooms etc.<br><br>Absence detection: lights manually switched on, detector extinguishes lighting in unoccupied room.<br>Extent of provision: offices, consulting rooms etc.<br><br>In addition, in rooms benefiting from daylight, luminaires near windows will be dimmable, regulated by the amount of daylight available.<br><br>Dimmable lighting has been included where specifically required by the ADB sheets.<br><br>Automatic control of lighting in rooms which have plenty of natural light will be regulated by means of a photocell within the space to ensure the required LUX is achieved by the combination of ambient and artificial light. | | | **2009 Project Bible**<br>Refer to the RFI Log contained in Contract Data Part 1.<br><br>**2010 ItP Project Bible**<br>Refer to the RFI Log (2010 ItP) in Folder B1 of The Instruction to Proceed Project Bible. |
| 5.0 | M&E Services | Please confirm that duty / stand-by plate heat exchangers will be provided for Domestic hot water. | Packaged plate heat exchangers/buffer vessels will be arranged to provide run/standby as described in Volume 4 Specification 4.28 and Volume 5 Schedule 5.2. | | | NC |

| | | | | | | |
|---|---|---|---|---|---|---|
| 6.0 | M&E Services | Please provide details of proposed thermostatic mixing valves for DHW. | Taps with integral TMV3 will be used wherever suitable (refer to attached data sheet). In situations where these are not appropriate separate TMV3 thermostatic mixing valves will be used such as Oventrop Brawa-Mix 97 (or equivalent). | | | NC |
| 7.0 | M&E Services | Please provide details of trench make up for main services. | Trench depths, spacings and backfill will be as NHS Model Engineering Specifications C01 for pipe services and C41 for electrical services. Buried pre-insulated heating and chilled water mains will be in accordance with the system manufacturer's recommendations but will be similar to above. | | | NC |
| 8.0 | M&E Services | Please confirm that twin regulating valves have been included for gas supplies. | Yes confirmed | | | NC |
| 9.0 | M&E Services | Please confirm that NRV will be fitted at each fire isolation valve as ER's. | Yes confirmed | | | NC |
| 10.0 | M&E Services | Please confirm mechanical air change rate for the ward tower. | A typical ward in the tower has the following air change rates to either meet the ADB requirements or achieve the environment conditions:<br>• Bedrooms 2.5 ACH (related to ensuite extract rate and air volume for chilled beam unit loadings)<br>• Ensuites 10 ACH<br>• Clean Utility 6ACH<br>• Disposal Hold 10 ACH<br>• Pantry 6 ACH<br>• Dirty Utility 10 ACH<br>• Equipment store<br>• Cleaner 5 ACH<br>• Nurse base Up to 12 ACH to balance extract from utility spaces, etc<br>• Office/meeting 4 ACH | | | **2009 Project Bible**<br>Refer to the M&E Clarification Log in Contract Data Part 1 for typical single bed ward.<br>**2010 ItP Project Bible**<br>Refer to the M&E Clarification Log (2010 ItP) in Folder B1 of The Instruction to Proceed Project Bible. |
| 11.0 | M&E Services | Please confirm type of fire Extinguishants gas proposed for the main Comms rooms. | The main comms rooms will be protected by a gaseous fire suppression system, the two gases for consideration at detailed design stage are NOVEC1230 and FM200. Both gases have attributes and issues; NOVEC1230 has a Global Warming Potential(GWP) of 1, while FM200 has a GWP of 2900. Certainly NOVEC1230 is kinder to the environment, but it is less kind to the IT assets it is protecting due to the much greater temperature drop when released, over FM200. The rapid rate of change of temperature has been shown to result in failure of the electronic components. The hope is that the suppression gas is never released and that the systems operate on a double knock strategy of operation | | | Subject to detailed review Stage 2<br>**2010 ItP Project Bible**<br>Incorporated in Fire Strategy, included in Appendix K in Folder V of the 2010 Instruction to Proceed Project Bible |
| 12.0 | M&E Services | Please indicate the plant resilience for hot and cold water services, e.g. full duplicate or is one extra unit proposed per plant area? | HWS calorifiers are provided in groups to serve zones of the building. Each group includes a standby calorifier. Refer to Volume 5 Schedule 5.2 Calorifier. | | | NC |
| 13.0 | M&E Services | Further to your responses to TC#2, the items listed in the attached Appendix B require further clarification/responses. | As noted on Appendix B | | | NC |
| **Renewables/Sustainability/BREEAM** | | | | | | |

| Technical Clarification 5 | | | | | | |

| | | | | | | |
|---|---|---|---|---|---|---|
| **General** | | | | | | |
| 1.0 | LCC | Please check and confirm/clarify 60 year LCC values. | We can confirm the 60 year LCC values, which are based on the same assumptions as the 30 year values. The assumptions and detail are outlined within the LC Models provided. | | | NC |
| 2.0 | LCC | Please resubmit LCC rates as per Volume 4 Clarification Technical 19n0 – Item 8 Table 1 Item 4.0. | The LCC rates have been derived from detailed LC models based on the Specification and Capital Cost information in the Brookfield (Doig & Smith) Capital Cost Plans ("*Stage 3 Bid Cost Plan"* and *"Stage 1 Non-Compliant Bid Cost Plan"*). These cost plans have been submitted based on the NSGH bid deliverable cost plan breakdown requirements.<br><br>In line with these the LC Models have therefore only been able to been built for:<br><br>1) The Acute Adult and Children's Hospital;<br><br>2) The Laboratory Building<br><br>3) The External Works<br><br>Refer to Appendix 1 for Hospital Benchmarks used. | | | NC |
| 3.0 | FM | Please provide information in connection with derivation of FM services £/m2/yr rate – e.g. Sample Range, Hospital Type, Level of Service. Ditto as against differing Facilities e.g. Hospital/Lab etc. | The £/$m^2$/yr rate for FM Services is based on an average cost derived from the Davis Langdon FM database which includes detailed FM service costs and specifications across a suitable range of appropriate projects. The database has been adjusted to reflect the current size and location of this Project. | | | NC |
| 4.0 | FM | Please provide breakdown of FM rate as per requirements of Table 1 Item 6.3 (Management/Staff/Contracted/Materials/Equipment costs) | An indication of the expected split of FM costs is as follows:<br>Management / Admin: 12.5%<br>Staff: 37.5%<br>External Contracts: 25%<br>Materials: 20%<br>Equipment: 5% | | | NC |
| 5.0 | Software | Please confirm that your Zutec software has been included in your priced proposals (this to include access, licensing and any necessary product maintenance requirements). Further please advise of system compatibility (i.e. does this interface with 'standard' software packaging and provision such as Microsoft products). | We confirm Zutec software/service is included in our priced proposals. This includes the access, licensing and associated product maintenance requirements during the 2 year DLP. We would also highlight that Zutec have included an additional 12 months beyond the 2 year DLP as a benefit to the project.<br><br>Zutec system is compatible with Microsoft products. Besides overcoming the logistics of handling volumes of hard copies, it provides an efficient and quick means to search/locate project information/data. This facility is also available remotely (from anywhere with internet connection).<br><br>At the end of DLP, a hard drive of the project information uploaded at that time will be handed over to the Board. The information in that hard drive is readable using internet browser (ie. Only software required to read/run the data is an Internet Explorer). This information can be exported/copied into Microsoft Word or Excel.<br><br>Should the Board wish to use the Zutec website to make ongoing updates to the project database beyond DLP, Zutec is able to offer a hosting solution on a monthly or annual fee basis. | | | NC |

| 6.0 | Fire Strategy | Can you confirm the qualified chartered fire engineer who will develop your design/strategy moving forwards. | The qualified chartered fire engineer overseeing our design development from WSP is:<br><br>Ryan McCreadie – Associate Director<br>BEng (Hons), PhD, MIFireE, Ceng<br>Chartered Engineer with the Engineering Council Division of the IFE.<br>Membership number – 00035119.<br><br>Mr McCreadie is assisted by the following WSP fire engineers:<br><br>Tom Grace – Associate Director<br>BE (Civil), ME (Fire), CPEng, MIFE, MSFPE, MIEAust<br><br>and<br><br>Kenny Hamill – Senior Fire Engineer<br>BSc (Hons) MRICS MIFireE | | | NC |
| 7.0 | Fire Strategy | It is noted that the smoke control proposal for the atrium relies on the decomposition of the ETFE roof based on a smoke/gas hot gas temperatures. What contingency planning would you recommend with regard to business continuity in this regard? | The ETFE roof system will be designed to ensure that the 'hot wire' activation only occurs in the highly unlikely event where a major fire occurs from adjoining areas into the atrium.<br><br>This activation sequence will be developed/16inalized in conjunction with the Fire Authority and the Board. However, we have considered the following features to limit the need for 'hot wire' activation:<br><br>• The environmental ventilation strategy for the atrium space includes for high level (side) vents to the ETFE roof and this will be used to support the smoke strategy in the early stages of fire development within the atrium (prior to any 'hot wire' activation).<br><br>• Lower volumes of buoyant smoke (at a temperature below ETFE failure) can be exhausted via the natural vent system.<br><br>• The vent sizes will be based on fire engineering calculations using BRE 368 for smoke management systems.<br><br>• Controlled fire load to atrium base by using fire load island philosophy. Fire loads will be concentrated into specific areas and separated by minimum distance to mitigate against fire spreading throughout the atrium base.<br>• The design fire size will be within the capacity for the natural vent system.<br><br>Furthermore and to reduce the threat of a major conflagration from adjoining areas into the atrium the following design features will be in place:<br><br>• Fire separation of areas opening onto atrium<br><br>• Sprinklers to areas adjoining atrium and appropriate areas in the atrium itself<br><br>• Glazing at ward levels to prevent smoke ingress from atrium to adjoining circulation areas<br><br>• Fire separation between clinical areas and circulation areas adjoining atrium<br>In developing the 'hot wire' activation sequence with the Enforcing Authorities and the Board, the aim is to filter out and avoid unnecessary occurrence by subjecting the activation to a number of "knocks/triggers". It is envisaged that this multiple layer control will firstly involve detection of a fire within the compartment adjacent to and off the atrium that may spread into the atrium. This detection is then subject to another knock whereby a manual override is provided to allow a suitable investigation period to establish cause of alert and validation of the size of the fire threat for 'hot wire' system to be finally activated. | | | **2010 ItP Project Bible**<br>BCL proposals incorporated in Fire Strategy, included in Appendix K in Folder V of the 2010 Instruction to Proceed Project Bible. Development of this item is subject to review and comment by the Board as part of the Stage 3 Design Development. |

| | | | | | | |
|---|---|---|---|---|---|---|
| | | | In the next stage of our design development, we will assess the possibility of limiting the loss of the ETFE roof to partial sections only (ie. Sufficient to vent the fire size to be agreed with the Enforcing Authorities). We will also assess to further minimize the impact of damaged roof on the operation for the clinical side of the Hospital by for example having glazed (smoke) separation to the atrium as mentioned above.<br><br>In reference to the contingency planning with regard to the business continuity, we believe that the ETFE roof 'hot wire' system would only occur in a very significant fire incident. In this scenario, the Hospital building itself is likely to have extensive damages and will be subject to major business continuity contingency planning. | | | |
| 7.0 | **M&E Service** | | | | | |
| 8.0 | Lift Study | Please confirm that your reference to the Exemplar in the lift study is erroneous and provide bed movement time from the ground floor to the top storey ward. | The data provided was based on the population figures issued by the client in the exemplar report. The approx time taken to move a bed from Ground to top storey ward will be 42 seconds assuming no intermediate stops (door opening at ground to door opening at top floor). On average each journey will take - 60 seconds including intermediate stops. | | | **2010 ItP Project Bible**<br>NC |
| 9.0 | Maintenance | Please confirm that a maintenance gantry in the atrium (ventilation actuator maintenance) is included in your priced proposals. | Actuators will be located externally (IP65 rated) for ease of maintenance.<br><br>Localised access facilities will be provided as necessary. | | | NC |
| **Renewables/Sustainability/BREEAM** | | | | | | |
| 10.0 | U-Value | Please confirm your primary U-values for (i) Glazing, (ii) Fabric and (iii) Roof. | Glazing 1.4 $W/m^2K$ inc frame<br>External wall 0.3 $W/m^2K$<br>Roof 0.25 $W/m^2K$ | | | NC |
| 11.0 | Permeability | Please confirm your building permeability. | The air permeability (infiltration) will be in accordance with the ERs Volume 2/1 App M&E.4/3.3.5(1) i.e 5$m^3$/hr/$m^2$ @ 50Pa | | | NC |
| **Laboratories** | | | | | | |

**APPENDIX B**
**NSGH – Bid Evaluation – TC#4 Items from TC # 2 which require further clarification**

| Prev TC ref | Original Item | Action update required | Bidder Response | | | |
|---|---|---|---|---|---|---|
| 1 | List received of suggested suppliers | Client not aware of several e.g. Switchgear, fire alarm, Nurse call and wholesalers used for several systems please provide details and confirm that any changes will require agreement with the Board (up to three manufacturers for each M E & PH item) | The list of suggested suppliers gives an indication of the manufacture/suppliers of the components proposed. The final selection of components will be by agreement with the Board from a selection of no fewer that 3 manufacturers unless specialist equipment dictates otherwise | | | **2009 Project Bible**<br>Refer Volume 5 the Contractor's Proposals in Contract Data Part 1.<br><br>**2010 ItP Project Bible**<br>Refer to the agreed Component List and position, located in Folder H1 of The Instruction to Proceed Project Bible. |
| 10 | Please confirm that BMS IP network will be fully stand alone and that all active equipment has been included. | Yes. Please provide supporting narrative for the included BMS IP network. E.g. raid storage, servers racks switches etc | The BMS kernel is built on two fault tolerant servers configured in a primary and hot standby fashion. The operating system will be Linux based with a SQL database for data management. The storage of BMS data will be on a RAID configured system and this will hold the immediate data live for 1 month. The SQL will be used for back up functionality and subsequent long terms analysis of the BMS system.<br>The system will have a primary fibre backbone with the appropriate Cisco managed switches breaking out into the copper IP networks at local system | | | NC |

| | | | | | | |
|---|---|---|---|---|---|---|
| | | | level. | | | |
| 11 | Tagging | Included. Please provide supporting narrative. e.g. tags are electronic integrated in the WIFI systems etc | The Tagging system works on RFID technology and there are two methods of operation.<br>1. For items such as wheelchairs, the system will display graphically the location of the asset and can be polled to find the nearest required equipment, such as staff requiring a wheelchair.<br>2. Other items can be set up so that they are governed by a boundary and if the asset is brought beyond this defined boundary, an alarm is triggered. | | | NC |
| 12 | Scaffolding will be used to land generators and transformers | Is this practical, will the scaffolding have permanent foundations etc. | The majority of replacement and maintenance items detailed in the plant replacement strategy in Volume 3.23 of our submission are dealt with via the FM lifts.<br><br>It is anticipated that the expected frequency for the replacement of the major plant items is once every 20-25 years or so in normal circumstances, if at all, and, if required, likely to take place during a period of planned major plant renewal.<br><br>It is considered that it is a reasonable strategy to allow for the erection of a temporary scaffolding working platform to facilitate the removal and replacement of equipment. A structure of this type with sufficient height and capacity can be easily erected at reasonable cost using readily available materials and labour.<br><br>It will be possible to erect such a temporary structure using standard scaffolding details with the footings bearing onto the ground externally, but with protection applied to the surface finishes.<br>It is possible to incorporate permanent concrete foundations to facilitate this work but it is unlikely that the specific scaffolding arrangement will be available during the initial construction work to enable a specific design to be constructed, or that the scaffolding proposals will not change over time and render the installed foundations redundant.<br><br>Where the equipment is required to be transported over the flat roof to reach a loading platform, the structure has sufficient design load capacity to facilitate this but with the actual roof finishes requiring protection as noted in the bid documentation. | | | NC |
| 13 | Medical gases and VIE | Please provide details of the plant resilience for medical air, 02, vacuum surgical air gas scavenging and nitrous oxide | All medical gas systems and plant are designed as per the current SHTM02-01, resilience within the selected plant items being provided in the following way:<br>Medical Air; a quadruplex plant will be provided, one compressor will act as a permanent standby, the remaining three compressors will be rotated through the demand requirements, this will insure boiling off of any excess condensate.<br>O2; two VIE stores will be provided, each store will be selected to provide 100% of the calculated demand, the stores will be configured as a run and standby mode.<br>AGSS; all AGSS pumps will be selected as duplex units, each pump will be rated to 100% of the calculated load. Each duplex plant will serve only four operating theatres.<br>Nitrous Oxide; a 2 x 10 manifold system with full automatic changeover facilities will be provided complete with a 2 x 1 ESM (emergency) manifold back up, all manifolds will be fully alarmed.<br>All other Air4 and Air 7 systems will have similar manifold systems complete with alarms and automatic changeover facilities | | | NC |
| 14 | luminaire details | Please provide info on LED and feature lighting luminaires | Refer to attached supplementary information | | | NC |
| 17 | Fire alarm PC includes incident location graphics | Please confirm fire alarm PC includes incident location graphics | Confirmed as included | | | NC |

| | | | | | | |
|---|---|---|---|---|---|---|
| 20 | Patient entertainment systems. | Schematic representation noted. Please provide equipment details e.g. infrastructure, equipment, patient interface etc. | The primary patient and staff interface within the ward spaces, is based on a unit, such as the Lincor system. These units are connected back over CAT6A cables to the local hub rooms to an appropriate Cisco managed switch. At this point the system is connected back to the head end, via fibre network. The head end, is a fault tolerant server solution with various interfaces to broadcast receiver equipment.<br>It is possible for this system to be integrated with medical records IT to have the local interface become part of the clinical information management at the bedside. This is not included in this proposal at this time. There is only one screen in the patient space that covers all functionality. | | | NC |
| 23 | Please confirm that metering | BREEAM compliance noted, please provide a narrative e.g. central monitoring and storage | Metering of engineering services will be provided in accordance with the requirements of the ERs, BREEAM and GIL 65. All metering points will be monitored, recorded and stored on the BMS. | | | NC |
| 24 | Water spillage protection in secondary comms room. | It is noted that fan coils will have drip trays. On the assumption that the drip tray is full please advise how fan coils can be used in secondary comms rooms while ensuring that the equipment will be protected | Subject to the final layout of the comms rooms options for the fan coil units include positioning high level detection in the drip trays linked to the FCU operation, or more preferably locating the FCU outside of the comms room and ducting the conditioned air into the room. | | | NC |
| 25 | Please confirm compliance with maintainability and area isolation requirements. | Compliance on Electrical services noted, please confirm compliance with maintainability and area isolation requirements. | Isolation of electrical services will be possible as follows:<br><br>It will be possible to isolate an entire HV ring by opening protective devices at each end in the energy centre.<br><br>Sections of HV ring may be isolated by selective switching of devices at substations along the length of the ring.<br><br>Transformers may be isolated at the associated ring main units.<br><br>Main LV Switchboards may be isolated by opening their main incomer.<br><br>Submains cables to sub switchboards may be isolated by opening their protective device.<br><br>Sub switchboards may be isolated by opening their main incomer.<br><br>A minimum of 2 distribution boards will be provided per department and final circuits will be interleaved so far as is practicable (see below). Thus isolation of one distribution board will affect half of the circuits in the area served by that board.<br><br>The majority of rooms will be provided with at least 2 lighting and 2 small power circuits. Exceptions will be rooms with one luminaire or one socket outlet such as toilets, cupboards, risers and so on where it would be impractical to provide duplication.<br><br>The ERs appear to require each individual room to be capable of isolation without impact upon adjoining areas. We have not interpreted this to mean that each room should be provided with dedicated electrical circuits. Strict adherence to this requirement would result in a minimum of 4 circuits dedicated to each room ie: Side A lighting, Side A power, Side B lighting, Side B power. A department with 100 rooms would require 400 circuits which equates to say 10 no. 18 way 3 phase distribution boards. There would be a considerable impact on the size of the local sub switchboards and the quantity of submains cabling as well as on the quantity of final circuit cable containment systems and space requirements to accommodate the distribution boards and large sub switchboards. | | | 2009 statement remains. |
| 28 | Plant and equipment will be suitably isolated to | Compliance noted, please provide narrative on proposals | Sound and vibration control for ventilation systems are described in Volume 4 Specification 4.33 giving proposals for plant attenuation, cross-talk attenuation and vibration control under fans etc. | | | NC |

| | | | | | | |
|---|---|---|---|---|---|---|
| | prevent transmission of noise and vibration. | | Major plant such as chillers, generators, compressor etc. will be provided with spring isolation mounts as required to reduce vibration.<br><br>Vibration isolation of pumps will be assessed with the pump manufacturer to determine the most appropriate method of isolation, with spring pipe hangers provided adjacent to pump assemblies.<br><br>Plant noise breakout to site boundaries and intrusive noise into adjacent buildings will be controlled by sound attenuators in the fresh air intakes to all plant to meet the limiting noise criteria for the hospital site. | | | |
| 29 | Please confirm that full environmental proving off all rooms will be provided. | Compliance noted, please provide narrative on proposals | A full environmental check on all rooms will be provided. This will be undertaken at the commissioning stage of the project, all rooms will be put through a range of internal conditions to prove the capacity within the systems to increase and or decrease the space temperatures within a set time line. These tests will be trend logged within the BMS over a given period of time and any faults found will be addressed before final handover. | | | NC |
| 31 | Please confirm that all services elements are included to meet the fire engineering solution, e.g. stair pressurisation, smoke control etc | Compliance noted, please provide narrative on proposals | All service elements have been included to meet the Section 2.10 Fire Strategy report.<br>Fire engineering has been used wherever beneficial to meet, or surpass, the minimum fire safety performance standards contained within the various guidance documents. To achieve this the services strategy includes for areas such as detection / alarm systems; escape bed lift provision; smoke dispersal from stair protected zones / fire fighting shafts / lift lobbies, atrium smoke and ventilation strategy; basement smoke control / clearance strategy; fire damper actuation etc. | | | **2009 Project Bible**<br>Contractor to develop a fire engineered strategy which complies with Statutory Regulations and Fire Code<br><br>**2010 ItP Project Bible**<br>Incorporated in Fire Strategy, included in Appendix K in Folder V of The 2010 Instruction to Proceed Project Bible. |
| 34 | Please confirm that leak detection has been included. | Compliance noted, please provide narrative on proposals | The leak detection systems will be developed during the detailed design phase and will utilise linear detection elements, broken into appropriate lengths. The system will form part of the BMS, with a graphic interface of the overall system. Leak detection will be logged under the BMS alarm handling and it will also be possible to configure plant shut down or other intervention, on the presence of a leak being detected. | | | **2010 ItP Project Bible**<br>Refer to the 2010 Instruction to Proceed Log located in Folder S of The Instruction to Proceed Project Bible for details of leak detection. |
| 35 | Please indicate percentage capacity of all water service pipework mains from the energy centre to the main buildings for resilience. | Heating response noted, please provide narrative for CWS and CHWS | The site water mains feed directly into the hospital with bulk storage in the basement. No CWS is fed from the Energy Centre.<br><br>HWS is generated locally within the plant areas to feed the various zones of the building. No HWS is fed from the Energy Centre. | | | **2009 Project Bible**<br>Refer to the M&E Clarification Log in Contract Data Part 1.<br><br>**2010 ItP Project Bible**<br>Refer to the M&E Clarification Log (2010 ItP) in Folder B1 and The 2010 Instruction to Proceed Log in Folder S of The Instruction to Proceed Project Bible. |

|---|---|---|---|---|---|---|---|---|---|---|---|
| 001 | Drawings to be uploaded in dwg format<br><br>**RESPONSE: THESE HAVE BEEN UPLOADED** | - | Info | Drawings addressed under the Drawing Log to be issued to Brookfield under separate cover. | Agreed | Brookfield Drawings to be included as Works Information 2 should take precedence over Works Information 1 (Employer Requirements) in the event of conflict. | Exceptions to be highlighted by the Board (i.e. out put CD1 drawings that require to remain, to be met by the developed BE CD2 drawing). | **Agreed that BIW log to be amended as relevant to replace Board drawings with Brookfield drawings. Refer BIW Log. | The Contractor drawing list is agreed and has been inserted into the contract: this can be located in the Contents Page of Volume 2 of the Contractors Proposals in Contract Data Part 1.<br><br>The Board M&E drawings that remain which remain as the output requirement of the Board, and require to be met by the Contractor design, are contained in the Employer's Requirements.<br><br>It is confirmed that the items agreed in the M&E Clarifications Log take precedence over the M&E drawings where relevant.<br><br>The Contractor is required to present their design proposals (drawings and narrative) through the design development (Stage 2) process for review by the Board, with such development by the Contractor to demonstrate achievement by the design of the above mentioned output requirement(s) of the Board through the iterative process of the developing design. | The Contractor drawing list is agreed and contained in Appendix K, which resides in Folders U, V & W of the 2010 Instruction to Proceed Project Bible (Appendix K therefore represents the current work in progress in relation to the Contractor's Proposals).<br><br>Any ER drawings that remain as the output requirement of the Board are listed in The BIW Log (ItP 2010).<br><br>Any BCL (2009 Project Bible) drawings that have not been superseded by Appendix K design development remain the relevant work in progress design to be referred to.<br><br>It is confirmed that items agreed in the Logs are agreed alternative compliance in respect of the ERs and also take precedence over the drawings. | Agreed |
| 002 | **Bedrooms – Clinical Risk Category.** Page 184 of the ERs states that wards are to be classed as Clinical Risk Category 3. Page 27 of Appendix M&E3 lists bedrooms as IEE GN7 Group 1, which would normally be viewed as Clinical Risk Category 4. We believe that the latter statement is correct.<br><br>**RESPONSE: IEE GN7 GROUP 1 TAKES PRECEDENCE** | - | NC | Information is included in ERs and therefore need not be added. | Agreed | BCL offer based on Wards being Clinical Risk Category 4 which we do not believe is reflected within ER`s. | It is agreed that wards are clinical risk 4 as SHTM | Agreed | | N/C | Agreed |
| 003 | **Crash Call** The ERs refer to "crash" call. Is this "staff to staff" call or an additional layer of call?<br><br>i.e.:<br><br>Patient to Staff / | Y | - | Statement that Crash Call is staff to staff with automatic paging to time scheduled list to | Agreed | * Subject to confirmation that as per Board intention the ER`s are updated such that this is clearly defined in the Works Information 1 | This document to be included as an addendum to Works Information Part 1. The ER's will not be updated (track changed) rather | **Noted but then there will be a discrepancy between the actual original ER`s and the | Agreed that addendum Logs take precedence over original ERs where a discrepancy occurs. | N/C | Agreed |

| Ref | Information Requested | Add | No Change / Info | Board Comment 1 | Status | Brookfield Comment | Board Comment 2 | Brookfield Comment 2 | Agreed Position 2009 Contract | 2010 ItP Comments (N/C = No Change from Agreed 2009 Contract) | Agreed Position 2010 ItP |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | staff to staff /<br>and Crash call<br><br>or<br><br>Patient to Staff /<br>and Staff to Staff (aka Crash).<br><br>**RESPONSE: CRASH CALL IS STAFF TO STAFF WITH AUTOMATIC PAGING TO TIME SCHEDULED LIST** | | | be included ERs for clarity. | | (Employer Requirements). | the RFI log, BIW log etc sit as addendum to ERs. | subsequent addendum documents. In this situation how would the Board address this discrepancy? | | | |
| 004 | HTM06-01 states that electrical loads in hospitals are growing by 3% to 6% per year. At 6% growth the spare capacity would be used within 5 years, at 3% within 9 years.<br><br>Based on current experience at SGH, does the Board have a view on whether the allowance of 25% for future growth is adequate?<br><br>**RESPONSE: THE 25% IS OVER THE COMPLETE FOOTPRINT, THIS IS IN LINE WITH THE FINANCIAL MODEL** | Y | - | Statement that 25% is over the complete footprint to be included in ERs for clarity. | Agreed | * Subject to confirmation that as per Board intention the ER`s are updated such that this is clearly defined in the Works Information 1 (Employer Requirements). | See response to Item 003, above. | Agreed | See agreed position in relation to Item 003, above. | N/C | Agreed |
| 005 | HTM 06-01 states that it is preferable for large healthcare premises that dual public electrical supplies should be provided from diverse sources originating from separate distribution network operator substations and fed from different parts of the National Grid with independent cable routes to and across the site to the main substation.<br><br>Can you advise if the negotiations carried out to date with the Utilities have indicated the extent to which this would be possible?<br><br>**RESPONSE: ONGOING NEGOTIATIONS INCLUDE THE PROVISION OF A TERTIARY 11KV CONNECTION (THIS WILL BE PRESENTED AT THE BREAKER IDENTIFIED FOR THE TEMPORARILY LAB SUPPLY)** | - | NC | Compliance with the HTM (now SHTM) requirement is included in the ERs and is to be met by the Contractor – the specific issue requires to be addressed by the Contractor (with support by the Board) as an aspect of the 33kV discussions and agreement with the utility provider. | Agreed | *Contractor, in discussion with Scottish Power, will endeavour to satisfy this requirement subject to availability of diverse sources from the grid. | No further action | **As discussed at the utilities meeting held on 2nd Dec 09 Brookfield understand that the Board accept that dual supplies from the grid may not be available. | The Board accept twin supplies from the Govan Road grid connection point. | N/C | Agreed |
| 006 | **<u>High Voltage Generators.</u>**<br>We note from drawing G1274E/(60)01 that Low Voltage generators are proposed each with a step up transformer for site ring connection. Would there be any objection, in principle, to High Voltage generators? We note that the CHP is shown as an HV unit.<br><br>**RESPONSE: THIS CONCEPT HAS BEEN INDICATED TO ALLOW THE USE OF EASY TO OBTAIN 400V HIRE SETS TO COVER MACHINE OUTAGES. ANY SOLUTION MUST INCLUDE THE USE OF EASY TO OBTAIN 400V HIRE SETS TO COVER MACHINE** | Y | - | The statement that any design solution must include the provision for use of easy to obtain 400V hire sets to cover machine outages to be included in ERs for clarity. | Agreed | * Subject to confirmation that as per Board intention the ER`s are updated such that this is clearly defined in the Works Information 1 (Employer Requirements). | See response to Item 003, above. | **Refer to Brookfield response to 003 above | See agreed position in relation to Item 003, above | N/C | Agreed |

| Ref | Information Requested | Add | No Change / Info | Board Comment 1 | Status | Brookfield Comment | Board Comment 2 | Brookfield Comment 2 | Agreed Position 2009 Contract | 2010 ItP Comments (N/C = No Change from Agreed 2009 Contract) | Agreed Position 2010 ItP |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | **OUTAGES** | | | | | | | | | | |
| 007 | The ERs, page 143, require the services to be configured to ensure that isolation can be achieved in each room without taking other rooms out of use. As written this requirement could be taken to mean that, for example, each electrical circuit must serve no more than one room, which we are sure is not intended. We seek further guidance on the intention of this clause.<br><br>**RESPONSE: A ROOM MAY BE "IN USE" AS LONG AS A PROPORTION (SAY 50%) OF THE OUTLETS ARE RETAINED AVAILABLE DURING MAINTENANCE OF A FINAL CIRCUIT OR LOCAL DB** | Y | - | The statement that a room may be "in use" as long as a proportion (50%) of the outlets are retained available during maintenance of a final circuit or local DB to be included in the ERs for clarity. | Agreed | * Subject to confirmation that as per Board intention the ER`s are updated such that this is clearly defined in the Works Information 1 (Employer Requirements). | See response to Item 003, above. | **Refer to Brookfield response to 003 above | See agreed position in relation to Item 003, above | N/C | Agreed |
| 008 | **Standby Lighting**<br>We seek clarification of Appendix M&E3, page 27, clause 3.5, Standby Lighting.<br><br>The ERs appear to require Grade A standby lighting to be UPS supported. We believe that this is not always necessary and that compliance with applicable standards can be achieved in a more cost effective manner.<br><br>Standby lighting grades signify the percentage of normal lighting to be maintained on mains failure. The grade of standby lighting required is not related to the permitted duration of interruption to the power supply.<br><br>For example, CIBSE LG2 requires bedrooms to be provided with Grade A standby lighting. Bedrooms are classed as group 1 by IEE GN7 and MEIGaN which implies that they would fall into Clinical Risk Category 4. The table below which is based on Appendix 1 of HTM 06-01 (we do not believe that SHTM 06-01 has been published yet) would indicate that this type of room would normally require the interruption to general lighting to be not more than 15 seconds. Thus it would not be usual to support all lighting to all bedrooms by UPS.<br><br>**Clinical risk category** / **IEE GN7 /MEIGaN group** / **Standby Grade / % provision** / **Interruptio to general lighting**<br>3 / 0 / B / 30-50% / <15s to 3hours><br>4 / 1 / A / 95%+ / <15s | - | NC | Overall treatment of lighting on Board 'Watchlist' for development and compliance to be demonstrated by the Contractor. | Agreed | Brookfield design will be compliant with SHTM06-01, CIBSE LG2, IEE GN7 and MEIGaN. Brookfield design proposal does not include for UPS support to all Grade A lighting as a blanket provision, as the grade of standby lighting is unrelated to the permitted duration of interruption to the power supply. | This can only be accepted if BE guarantee that the lights will be reinstated (by the generators) within 15 seconds. This will be challenging and will require full load management<br><br>OR<br><br>Provide inverter cover to grade A lighting with for example 5 minute battery autonomy. | **Load estimate of lighting is such that 1 generator on "A" side and one on "B" side will accept the lighting load within 15 seconds. Generators will be selected and configured and controlled to achieve this. The remainder of the load will be supported when remaining generators are synchronised | BE to demonstrate via Design Development (Reviewable Design Data) that this can be achieved.<br><br>Should this not be the case (i.e. cannot demonstrate) BE to revert to and include inverters at no additional cost to the Board. | N/C | Agreed |

| 142 | Re: Laboratories/Permit to Discharge Certificate<br><br>We would be pleased if the Board would confirm if there are any substances that require special treatment prior to discharge into the drainage system.<br><br>In addition, would the Board confirm that they will procure the Permit to Discharge Certificate.<br><br>**RESPONSE:** In our recent meeting with Scottish Water, we asked Scottish Water to clarify whether they would accept the nature of discharge to the foul network. Scottish water requested that we supply details of the likely effluent - this is currently being finalised. Scottish Water will then pass onto their trade effluent department for review.<br><br>This will relate to the Permit to Discharge - the need for which will be dependant on Scottish Water's review of the list provided. They have commented that NHS may require an amendment to the current trade effluent consent.<br><br>That said, the bid team should promote any permit to discharge on the NHS's behalf. | Y | - | This is an aspect of the design that the Contractor is responsible for and requires to develop and satisfy in the Laboratory element of the scheme. | Agreed | Confirmed in dialogue that there were no requirements for special drainage. Board to procure the Permit to Discharge Certificate | | Francis W was looking into this | Acknowledged that BE have made allowances per the Stage D design information in this respect. | Laboratories – not relevant to this Log. | Agreed |
| 143 | Re: Laboratories Design- Home Office Requirements<br><br>We would be pleased if the Board would confirm if the design of the Labs facility or any distinct parts of the facility is/are required to meet any Home Office standards.<br><br>**RESPONSE:** Home office standards apply to Level 4 Microbiology in terms of containment and finishes for CAT 2 laboratories.<br><br>The CAT 3 Laboratories within Microbiology and Pathology will also require to conform to Home Office Standards. Home office personnel will following construction during the commissioning phase review installation for regulation compliance. | - | Info | This will comprise an aspect of the Stage E Laboratories Design Information | Agreed * | | BE to comply with original RFI response as ER requirement. | **Brookfield bid submission allows for requirements to CAT 3 LABS AND Mortuary but not for CAT 2 grade to the rest of level 4. | This to form an aspect of the Stage D to Stage E Laboratory review and alingnment. | Laboratories – not relevant to this Log. | Agreed |

| Ref | Information Requested | Add | No Change / Info | Board Comment 1 | Status | Brookfield Comment | Board Comment 2 | Brookfield Comment 2 | Agreed Position 2009 Contract | 2010 ItP Comments (N/C = No Change from Agreed 2009 Contract) | Agreed Position 2010 ItP |
|---|---|---|---|---|---|---|---|---|---|---|---|
| 144 | Have, and how have, the Labs team achieved the 80kgCO2/m2/annum design energy target?<br><br>**RESPONSE:** The Laboratory Design is ongoing and the model is being refined, however, the overall solution is integrated with the Energy centre. Further design information will be made available in due course. | Y | | This is an aspect of the design that the Contractor is responsible for and requires to develop and satisfy in the Laboratory element of the scheme. | Agreed | As clarified in Brookfield Bid submission, the ITSFB design does not currently meet this requirement and any fundamental change to the Labs Scheme that may be required to be implemented, if practical, to achieve this energy target will be a Change under the Contract | Compliance to be achieved upon connection to the Energy Centre. | Agreed | Compliance to be achieved upon connection to the Energy Centre. | In Accordance with CE010 Lab Project Stage 1 – RIBA stage D to Stage E reconciliation. | Agreed |
| 145 | Re: Cladding Materials to Labs & FM Buildings<br><br>There seems to be some discrepancy on cladding material information shown on the Planning drawings compared to information in Pricing Schedules and the Outline Architectural Specifications. We would be pleased if the Board would clarify and confirm which document takes precedent.<br><br>RESPONSE: The Planning Drawings and the Outline Specification take precedent over the pricing information. Information on the Rainscreen is located in the Outline Architectural specifications. | - | Info | This will comprise an aspect of the Stage E Laboratories Design Information | Agreed | | Planning drawings and outline specification take precedence per original RFI response. | | Compliance to be achieved upon connection to the Energy Centre. | N/C | Agreed |
| 146 | Further to TAD 00025 with the Laboratories Ecological Report attached, we would be pleased if the Board would confirm if it is the intention of the Board to procure a Bat Survey on the Laboratories the Energy Centre Site and the Main Hospital Site as indicated in the URS Report dated July 2009 section 6.1.2 , Page 7.<br><br>**Response:** A bat habitat assessment is expected to be undertaken by the Board during Sept.2009 of the Laboratories,Energy Centre and Main Hospital sites. This will be passed to the main bidder on contract award.<br><br>The sites of the Laboratories or Energy Centre contain no buildings or trees /habitat which are considered suitable for roosting. Additionally there has been no reports of evidence of bats on the site. | Y | - | The bat survey is available from the Board w/c 23 November 2009. | Agreed * | *Bat survey is still awaited. | Bat survey will be uploaded to BIW Volume 6 (new volume) | | Bat survey will be uploaded to BIW Volume 6 (new volume) | N/C | Agreed |

| Ref | Information Requested | Add | No Change / Info | Board Comment 1 | Status | Brookfield Comment | Board Comment 2 | Brookfield Comment 2 | Agreed Position 2009 Contract | 2010 ItP Comments (N/C = No Change from Agreed 2009 Contract) | Agreed Position 2010 ItP |
|---|---|---|---|---|---|---|---|---|---|---|---|
| 147 | Re Energy Centre<br><br>We would be pleased if the Board would urgently confirm the start date of the Energy Centre as there appears to confusion as to the verbal advice given at the last dialogue meeting.<br><br>Response: The Energy centre forms part of the main hospital build and should commence in Nov.2010 at outset of stage 3 | - | Info | No action required in respect of this RFI. | Agreed | Brookfield would note that all Works in this regard is currently included in Stage 3 Works. | Energy Centre will be part of Stage 3 and expectation is that the shell, as a minimum, will be completed in year 1 to coincide with completion of laboratories. | | Energy Centre will be part of Stage 3 and expectation is that the shell, as a minimum, will be completed in year 1 to coincide with completion of laboratories. | N/C | Agreed |

**THIS IS THE SUSTAINABILITY LOG (2010 ItP)**

**Sustainability and Energy Consumption**

**2009 Project Bible Requirements = Black Text**
**2009 Project Bible Responses from Brookfield = Red Text**
**2010 Instruction to Proceed Status = Blue Text**

1) Operational Energy Targets (basis)
   - Updated Energy Model to be produced within 6 weeks
   - Issue updated report prior to each key design stage (condition of approval to proceed to subsequent stages)
   - Final model to be provided 3 months in advance of Stage 3

   Brookfield will include within the detailed design programs for Laboratory and Adult / Children's hospital monthly sustainability design review hold points up to FBC as per schedule provided by WSP & Ecoteric.

   Hospital and Laboratories energy targets are addressed and included as part of the design development. Specific workgroups focus on energy issues and report to the design groups and in turn the Project Management Group.

   Range of dates for progressive development of model to be provided. Final iteration of model will be delivered no later than 3 months prior to the completion of Stage 3.

2) Operational Energy Targets (areas)
   - Clarify exact area as a benchmark going forward

   80kg$CO_2$m$^2$ against net building area 136,490m$^2$

   Targets being addressed through activity and groups identified in Item 1 – above.

   The current gross area is in the order of 171,000m$^2$: the figure to be utilised for modelling shall be determined by applying the equivalent calculation to the current gross area that was utilised for the 2009 Project Bible to determine the 136,490m$^2$ previously to be applied.

3) Operational Energy Targets (content)
   - State clearly in Mwh per annum and $CO_2$ for fossil and electrical energy, the building demand, gross energy supply and carbon offset by renewables
   - State assumed area in m2

   Energy model will include this information and will be developed during the design development stage as BE programme

   Targets being addressed through activity and groups identified in Item 1 – above.

4) Operational and Design Energy Target
   - Include climate change impact within future modelling

Future modelling could include potential effect of climate change subject to an agreed set of parameters.

Modelling to be addressed through activity and groups identified in Item 1 – above.

5) Operational Energy Target: Energy Costs
   - Range of 15% given on Energy Cost: Confirm stated energy target includes upper value of range stated.

80kg$CO_2$m$^2$ is within upper range (£2.6 million plus 15%) as stated.

2009 statement stands.

6) Laboratories Board to advise energy use determined at Stage E
   - Establish likely energy usage of laboratories

Ecoteric confirmed stage D laboratory design did not comply with target emission reduction (TER) 80kg$CO_2$m$^2$ and or BREEAM Rating Excellence.

The Board has stated that the laboratory target emission reduction 80kg$CO_2$m$^2$ is to be achieved upon connection to the Energy Centre.

Stage E Laboratory design will be assessed upon receipt in respect of BREEAM rating and target emission reduction.

The Laboratory position is in accordance with CE010 Lab Project Stage 1 – RIBA Stage D to Stage E reconciliation.

7) Future Proofing
   - Confirm provision of a comprehensive solution for future fuel flexibility without impact on current design

Reference Clause 8.3.38 of Volume 2/1, there is no specific requirements for 'future fuel flexing' and as such the Contractor's Proposals do not include these.
However, as boilers are dual fuel oil and gas, some ability exists to run on alternative fuels although limited by current oil storage provision as Appendix M&E.2 Section 4 (7 days).

Future fuels flexibility based on fuel oil, natural gas and biogas if supplied as the same characteristics of natural gas.

2009 statement stands.

8) Lighting Controls
   - Clarify extent of automatic controls

Lighting control based on Brookfield proposal and as stated in agreed RFI log.

Controls addressed in Logs and design development.

9) Renewables
   - Clarify what has been included
   - Clarify output of proposed wind turbines

Refer to contractor's proposal section 3.20.
Brookfield will further investigate the following:

- Off site wind.
- Borehole water use.
- Ground Source.

The investigations and conclusions will consider commercial viability

Relevant items being progressed per Early Warning contract activity.

10) Active Energy Management
   - Provide statement on deliverables, expertise and included scope.

Brookfield advised that the bid offer included during 24 months DLP (as per Contractors proposal Vol 3 3.24)

- Energy monitoring.
- Monthly energy report.
- Ongoing fine tuning of systems to ensure compliance with design.
- Zutec asset management system interfaced with the energy metering system
- WSP sustainability will review energy data and reports.

2009 statement stands.

11) Natural Ventilation

- Clarify extent of openable windows within bid

The Board's requirement to limit space temperatures to 26 °C means that the use of natural ventilation is limited and that a sealed building is the only way to meet the requirement.

There may be areas that can be naturally ventilated, but this can only be determined once the whole building has been thermally modelled during the detailed design stage, and is reliant on the following being available:-

- Signed off 1-200 layouts
- Signed off envelope details
- Agreed information on occupancy and equipment gains
- Agreed room environmental conditions (also expressed on a set of Environmental Treatment drawings)

However, at this time our opinion is that all continuously occupied spaces will be sealed and use either all air or chilled beams to maintain the required conditions. Transient spaces such as street, circulation spaces and atria (subject to CFD analysis) are envisaged as being naturally ventilated, as there is unlikely to be a strict requirement for upper temperature control

Design development addresses ventilation proposals and details.

12) Energy Saving Measures

- Provide detailed list of bid inclusions.
- System by system, zone by zone listing required stating heat recovery, motor type and controls method required in design development stage.

Refer to Volume 3 Section 3.20 of Contractor Proposals for details.
Brookfield will provide all necessary information during detailed design and technical Submissions prior to procurement.

Design development will address energy saving measures.

13) Whole Site Energy

- Confirm retained and future estates are included within the energy provision of the Energy Centre.

Agreed that this is not a Brookfield issue.
Ecoteric will discuss issue with Board.

2009 statement stands.

14) Individual Room Controls

- Confirm ability to control rooms individually.

It is envisaged that the majority of the hospital will be able to be provided with individual room temperature control on the following basis:-

- Individual occupied spaces served by chilled beams will have local control
- Heated only spaces utilising radiant panels with have local control
- Specialist 'air conditioned' areas (such as theatre suites, diagnostic imaging, etc) will have individual room control

In multiple occupancy spaces such as A&E cubicles areas, waiting areas, ancillary support rooms, etc where individual room control is impractical then temperature control will be on common return air.

Design development addresses room controls.

**This document is 'The 2010 Instruction to Proceed Log - FINAL'**

| | Clause | Subject | BCL Comment | Board Comment | Status | Owner | Action by | Awareness | Board Action Response |
|---|---|---|---|---|---|---|---|---|---|
| 1 | 4.15 - Para 3 | Availability & Expansion | Does this need tying down to "Design Reserve" in terms of "anticipated changes in medical equipment. | The design as developed, incorporating the required spare capacity on electrical & mechanical distribution is deemed compliant with the intentions of this clause. See also Design Reserve Capacity Matrix (FINAL) | Agreed | | | | |
| 2 | 5.1 | 5.1 NHS Documents | These documents will be taken into consideration in the final design, however, it is likely that there will be some conflict between the ER's and these documents. Some of the older documents published are also not appropriate for the scale of the project, eg (SHTM 2023. | Any non-compliance with documents listed as mandatory within the ER's will require to be agreed with NHS GG&C. Conflicts raised in the evolving design design moving forwards should be highlighted for discussion. | Agreed | | | | |
| 3 | 5.1.4.1(j) | NHS Model Engineering Specification | These are now considered to be significantly out of date in terms of standards (BS) and modern materials. The National Building Specification (NBS) has been used which encompasses the spirit of MES. | Agreed that the NBS specification is appropriate and may be used. Some items from MES may require to be retained (to be identified by Capita) | Agreed that NBS specification and British Standards are the relevant standards to be utilised (and adapted if necessary). | | | | |
| 4 | 5.12.3 | Services Capacity Resource | Plantrooms and risers do not have 25% additional area for future flexibility, but space is included in the plant and riser services as Design Reserve (see 8.1.12.3) | The intent of the ER's was to incorporate 25% capacity, in total, for expansion of systems. This can be achieved via a combination of Design Reserve or space. See Design Reserve Capacity Matrix (FINAL) | Agreed and will go on to Stage 3 Design Development Watchlist. | | | | |
| 5 | NOT USED | | | | | | | | |
| 6 | 6.8.7.1 | Testing & Commissioning Documentation | Ductwork cleaning etc. | The list of test documentation provided within the ER's was indicative. It is anticipated that a full "Deliverables Schedule" of documentation will be agreed between the parties including the Project Supervisor. | Agreed | | | | |
| 7 | 7.3.3 | Ceiling Heights | How is the 4500mm clear height for the Therapy Room to be accommodated. | Stage 3 design development item - details to be proposed and provided by BCL. | To go on to Stage 3 Design Development Watchlist | | | | |
| 8 | 7.3.5(b) | 3D Design | 3D modelling will only be used where simple zoning strategy cannot be employed along with sections. | This limitation will only be accepted by NHS GG&C if adequately demonstrated as suggested. The Requirement to provide 3D modelling therefore remains a part of the ER's at this time. | Agreed | | | | |
| 9 | 7.3.5(e) vi | Non access ceilings | Where access is required (on an infrequent basis) the removal of the luminaires will be used to set VCD's etc. | Will not get VCDs out with the rooms in Recovery Suite, Anaesthetic Rooms, Theatres and therefore propose to have access through luminaires | Agreed that ER requirement remains presently. Detailed proposals to be provided by BCL to the Board for review and consideration as part of Stage 3 design development. Add to Stage 3 Design Development Watchlist | | | | |
| 10 | 7.5.5(k) | Door Closers | Doors will be closed at night via fire alarm system and not BMS. Integration is high level between BMS and Fire Alarm (they squawk to each other but do not interact/control). | 8.3.4.24 (p193) of the ER's provides details in this regard - to be via fire alarm - BCL proposal is compliant therefore with the ER requirement. | Confirmation of where front end Fire Alarm to reside. Practical implications and Strategy for (building wide shut-down) to be taken forward by Commissioning Group during Stage 3 design development (e.g. local versus isolated control, doors dropping at a set time, protocols, writing out doors from dropping etc). | | | | |
| 11 | 7.6.5 | Windows | No use of opening windows | It is noted that there are no opening windows and therefore those elements of this section that relate solely to opening windows are accepted to be non-applicable, however, there are elements of the section that remain applicable to fixed glazing and these remain part of the Employer's Requirements. | Agreed | | | | |
| 12 | 7.7.2 | Envelope Solutions | The building is sealed and no natural ventilation applies | 7.7.2(d) states that 'a sealed building where a maximum temperature solution is provided' is acceptable. | Agreed | | | | |
| 13 | 7.9.6(h) | | Make a note in H&C specs about prohibited use of flexible hose connections | Prohibition to remain and be enforced + noted in specifications by BCL | Agreed | | | | |
| 14 | 7.12.6 | Lifts | States that dimensions are between the handrails. It is taken that this is to get bulky items into the lifts and not to oversize them which would result in inefficiencies | Understood that no non-compliance with the ER requirement is proposed by BCL. | Agreed | | | | |
| 15 | 7.12.9 | Lifts | states that the doors in all lifts shall have a clear opening of 1100mm. There are 4 Lifts in the laboratories which only have 900mm openings, these are all passenger lifts. The shaft sizes inherited do not allow doors with an opening that wide. We have incorporated the maximum width of opening of 900mm which is in accordance with HTM 2024 and EN81, the European Lift Standard. | Accepted | Agreed | | | | |
| 16 | 7.12.10a | Lifts | States that lifts within the atrium should be fully glazed. Due to fire issues all the shafts and lifts in the atrium are solid construction and lobbied. | Board to consider this proposal in the context of the fire strategy during Stage 3 design development. ER remains, proposal to be tabled during Stage 3. | To go on to Stage 3 Design Development Watchlist | | | | |
| 17 | 8.1.1.13 | IPS/UPS | States that power distribution systems and final circuits where required shall incorporate IPS and UPS systems to meet the requirements of (SHTM 06-01. UPS will be provided for clinical risk category 5 only, IPS will be provided in accordance with Healthcare interpretation of IEE guidance note 7 (Chapter 10) and IEC 60364-7-710-2005. The Board will assess each medical location and provide bespoke PART A schedule. MEIGaN requirements are limited to the locations listed in MEIGaN clause 3.2 i.e. "imaging areas" | This is a clarification statement from BCL that they are complying with MEIGaN - the application for such being Imaging. Agree only applies in certain areas, BCL to provide identification of areas | Agreed that both IPS and MEIGaN lists are reflective of requirement and noted that these will adjust with the design development to settle on exact rooms for the final solution. | | | | |
| 18 | 8.1.2.3 | | Generally the principles of HTM 2023 will be followed for access, but in some cases the size of the development will require some divergence from the HTM. | Please provide examples of divergence in order that this can be assessed. | Agreed that any divergence fro m SHTM 2023 to be raised in advance by BCL during the Stage 3 design development for review and consideration by the Board. Add to Stage 3 Design Development Watchlist. | | | | |
| 19 | 8.1.3.1 | | 25% space reserve in risers and service voids. Does this apply elsewhere? | The intent of the ER's was to incorporate 25% capacity, in total, for expansion of systems. This can be achieved via a combination of Design Reserve and space. | Agreed - see also Item 4 | | | | |
| 20 | 8.1.3.2 | | 25% reserve capacity matrix. | See Design Rserve Capacity Matrix (FINAL) | Agreed - see also Item 4 | | | | |
| 21 | 8.1.3.4 | | Access will be required in clinical areas where ~~demonstrable~~ grid ceilings are provided. In critical care areas this will be minimised and avoid patient occupied zones | ER to remain, BCL to make detailed proposal durin g Stage 3 design development for Board consideration. | To go on to Stage 3 Design Development Watchlist | | | | |
| 22 | 8.1.3.8 | | Generally pipe work and electrical services will run in corridor zones, but ductwork will run above occupied rooms. | Access points etc for duct cleaning should be located out with occupied rooms wherever possible - ER to remain, BCL to make detailed proposals durin g Stage 3 design development for Board consideration. | To go on to Stage 3 Design Development Watchlist | | | | |

| | | | | | | |
|---|---|---|---|---|---|---|
| 23 | 8.1.4 | ICT Rooms and IT | gives conflicting requirements with regards to services and wet systems in the ICT rooms. It is proposed, as far as possible, to route all drainage from rooms overhead to avoid the ICT rooms. Where this is not possible, additional measures including drip trays will be incorporated. Wet cooling units will be provided in all ICT rooms and n+1 in the two main server rooms. Pipes will be routed to run close to walls and to avoid racks. Pipes from other services will not be routed through the ICT Rooms. Leak detection will be provided to give warning of water on the floor. Cleaning will be carried out as specified. | Please advise what conflicting advice is given. | Agreed that no ceilings in nodal ICT rooms. Agreed that ceilings will be provided in Server rooms per the ER requirement. These to be waterproof. No wet services to be above ICT or Server Rooms. | |
| 24 | 8.1.23.3 | | States infers that 8 diverse routes for IT could be required into the A&C. This is not possible and it is proposed to bring 2 routes into the building each with 4 network providers | Diversity is achieved by the interlinking of 8.1.23.1 (i.e. linkage of IT Rm1 to IT Rm2 Adult¬Children's). 4 ducts out at Renfrew Road and 4 ducts at Hardgate Road. | Agreed | |
| 25 | 8.1.5.11 | | Whole practical individual room temperature control will be provided, however, in larger departments with multiple rooms, e.g. AAW upper temperature control will be averaged across larger zones or groups of rooms. | | Agreed | |
| 26 | 8.1.12.3 | | Dual paths have not been provided to piped systems except for external heating and chilled water mains. RFI Log 031 & 068 refer to electrical services. | In terms of dual paths, the following has been provided. | With reference to the water systems only; Dual 100% paths on the MTHW & Chilled water from the energy centre to the A&C (in separate trenches). Dual paths will not be provided on any other water distribution systems. However the zoning of each system allows for coverage within the hospital being split into sections. Each pumpset is twin head, each heat exchange staion is modular with redundency, each calriofier station is grouped in sets with redundence. Where possible feed in routes are split, example in wards, half a ward is fed from one side and half the other side, with regards domestic water. | |
| 27 | 8.1.12.5 | | 25% reserve capacity has not been applied to theatre plant as this is unlikely to change, but 10% has been incorporated. | Nature of installation (pod per theatre) makes this practical (i.e. would add whole plant per new theatre) 10% for tolerance update etc | Agreed | |
| 28 | 8.1.22.9 | | Clarification required as to the intention of this clause. The gas provision to be discrete but the outlet 'normal' and useable in the normal fashion assumed - with back-up requirements not beside the bed/in view etc to avoid anxiety in patients in children's hospital | Agreed that ancillary equipment is covered, plus the requirement for covered outlets that are anti-ligature in DCFP and the 1xEmergency Department (special room). | Agreed | |
| 29 | 8.1.22.3 | | New VIE compound will not be sited as per drawing G1274/U(96)01. See Masterplan for locations | Accepted that the location will be set by the space available within the Masterplan. | Agreed | |
| 30 | 8.1.24.1 | | Refer to 5.1.4.1(j) | | Agreed - see also Item 4 | |
| 31 | 8.1.25.1 | | Refer to 8.1.12.5. Space to allow for extension of generation capacity of 25% growth. Allowance has been made for generation of 18MVA on the basis of N+1 | | Agreed | |
| 32 | 8.2.2.1 | | Bypasses to critical department control valves are not currently included as these result in dead legs. It would be anticipated that a selection of spare valves be held for quick 'swap out'. | ER requirement to remain. | Agreed - ER requirement to remain. | |
| 33 | 8.2.2.2 | IT & Hubs | Permits FM equipment to be located in the ICT rooms. We will take up this option in certain areas. | No non-compliance with ER's is proposed. | Agreed | |
| 34 | 8.2.3.2 | | Refer to RFI Log for revised metering proposals - sub-metering for each department may not be achievable | If no variation is proposed to contractual position, i.e. installation as per revised specification in RFI Log, then this is compliant. | Agreed as per the details contained in the original 2009 M&E Clarifications Log - reinforces position that sub-metering does not cover every department. | |
| 35 | 8.2.11.1 | Ventilation | Can be read that all rooms have local temperature control. Local controls will be provided in all rooms with Fan Coil Units or Chilled Beams. Elsewhere adjustment of ventilated areas will be carried out as a BMS function by changing set points. | ER's call for all rooms to have LTControls. | The under noted is Agreed, on the basis that it only applies to the Acute Assessment Unit and that it is subject to demonstration of satisfactory details of proposals and controls during the Stage 3 Design Development. Agreed In Principle therefore and moved to Stage 3 Watchlist.The environmental systems in the Acute Assessment ward comprise mechanical ventilation and radiant heating panels the latter with local control. The radiant panels satisfy the heat losses and the ventilation the heat gains. As the assessment wards are used for short periods of time the internal heat gains do not vary greatly and therefore having a multiple room control will not greatly vary the internal summertime temperature. The critical care areas have an all air system and are grouped such that one heater battery serves a series of two or three bed bays. Each of the groups of bed bays have a similar aspect and solar gains/heat losses and as they are of the same use have similar internal gains. The bays are also open/curtained bays and so could not be treated individually. Therefore grouping the room control should maintain the space condition within the required limits. | |
| 36 | 8.2.15.1 | | For clarity IT hub rooms do not have N+1 resilience. | This was not the intent of the ER clause. These are covered by the requirements of clause 8.2.15.2 | Agreed | |
| 37 | 8.2.17.4 | | Are standard bedheads being used in NCH? If so, what about concealing medical gases? NA to advise | Agreed that ancillary equipment is covered, plus the requirement for covered outlets that are anti-ligature in DCFP and the 1xEmergency Department (special room). | Agreed | |
| 38 | 8.2.20.6 | | Piped gases in the hospital will be Nitrous Oxide, Surgical Air 7 bar, Medical Air 4 bar, Medical Vacuum and Anaesthetic Gas Scavenging. Oxygen/Nitrous Oxide mixture and Helium/Oxygen are used in limited spaces and are assumed to be by means of local portable bottles. | Piped gas requirements are clarified within the room data sheets. | Agreed that ER remains, this issue is addressed and dealt with under the contract via the Early Warning Raised and subsequent PMI. | |
| 39 | 8.2.27.2 | | Fuel for boilers and generators will be the same, namely diesel oil. | 35sec and diesel oil are the same provision | Agreed | |
| 40 | 8.2.27.6 | | Reference is Model Engineering Specification. (3) | Capita note that some MES items to be retained (to be confirmed by Capita) | Agreed that NBS specification and British Standards are the relevant standards to be utilised (and adapted if necessary). | |
| 41 | 8.2.29.3 | | MTHW will not be supplied directly to dishwashers | MTHW is a pressurised system and therefore not compatible with system. Will come from domestic system. | Agreed | |
| 42 | 8.2.30.1 | | Method of leak detection by meter reading differences | Major leak detection where water enters building No satellite tanks (all will be in main building) ~ small break tanks in the hospitals. Meter at each of the external boundaries and each of the entry points. Detection will need to be by checking external (incomer) versus meter at entry to building - no automated/alarmed provision. BMS pulsed output could be added to SWater meter if we can or put pressure gauge on income to spike on BMS. | Agreed - BCL have included pulse output meter reader to SWater supply that will then flag on BMS. If not provided bt SWater an extra meter will be provided by BCL and the ER requirement met. | |

| | | | | | |
|---|---|---|---|---|---|
| 43 | 8.2.30.2(c) | Leak detection provision | Leak detection will not be provided in plant room bunds adjacent to Theatres, etc but in ceiling voids above theatres etc. This will allow detection for both the area above the Theatre (i.e. the void) as well from the plant room. If to be in plant room also tape to go near top of riser to trigger, not blanket that will trigger on condensation etc. | This is not agreed and will need to be revisited. | Agreed that ER requirement remains, specific proposals for compliance to be provided by BCL for Board review during Stage 3 design development. To go on Stage 3 Design Development Watchlist. |
| 44 | 8.2.32.1 | | As advised by the Fire Consultant. Staircase pressurisation is not required. | As per the ER's pressurisation is to be provided as required. If the strategy meets all requirements without pressurisation then this is accepted. | Agreed |
| 45 | 8.3.2.1.3 | MV Systems | The MV Distribution system arrangements will be as shown on drawing No. ZBP-xx-xx SC-SK-001. | Agreed | Agreed |
| 46 | 8.3.2.1.4 | MV Systems | The MV Distribution system arrangements will be as shown on drawing No. ZBP-xx-xx SC-SK-001. This coupled with automatic change over between A and B supplies at LV provides a resilient solution. | Agreed | Agreed |
| 47 | 8.3.2.1.5 | MV Systems | The MV ring circuits are being designed to be open circuit as shown on drawing ZPB-XX-XX-SC-SK-001. Resilience will be designed in by selection and operation of the LV devices in the main LV switch panels. Protection schemes will be time graded to minimise disruption | Agreed | Agreed |
| 48 | 8.3.2.1.6 | MV Systems | Metering, earth fault protection, overcurrent protection and ENMS control will be provided as shown on drawing number ZPB-XX-XX-SC-SK-001. The ENMS (Electrical Network Management Systems will be specifically designed to control the MV and LV distribution networks to match the available supplies to the load and the load to the available supplies - Refer to the MV specification for further details. | Agreed | Agreed |
| 49 | 8.3.2.1.7 | MV Systems | The MV distribution system arrangements will be as shown on drawing ZPB-XX-XX-SC-SK-001. | Agreed | Agreed |
| 50 | 8.3.2.2.4 | LV Systems | Metering will be provided to accord with the Building Regulations. Each meter will have digital outputs to the BEMS systems where energy consumption will be recorded. The ENMS will record energy usage for the purpose of protection of the distribution systems and ensuring the available supplies are not overloaded. | Agreed | Agreed |
| 51 | 8.3.2.2.5 | LV Systems | The ENMS will be provided with principle control units in the main 33/11kV sub-stations and in each of the generator control rooms. A system status panel will be provided within the FM office. This will enable monitoring of the whole of the MV and LV networks. Local system status panels will be provided on each main LV switchboard. These will enable monitoring of the local MV systems. | Agreed | Agreed |
| 52 | 8.3.2.2.6 | LV Systems | Systems status schematics will be provided on the ENMS panels. The schematics available on these will be commensurate with the levels of monitoring and control noted above. | Agreed | Agreed |
| 53 | 8.3.2.2.7 | Touch screen PC within Main Switchboards | Where provided, the screen will provide viewing functionality only, no control will be provided via the touch-screen PCs. | Only suitably trained and appointed personnel should have the ability to alter control set points. The switchboard screen should only be used for display. In the event of an alarm condition or the requirement for an alteration of a set point the switchboard operator should contact the designate personnel within the Board facilities team. | Agreed |
| 54 | 8.3.2.2.10 | Sub-distribution and final distribution boards construction | in clinical risk categories 3, 4 & 5 it is proposed to provide Form 4 Type 2 sub-distribution boards. A review is required with the Board and Design Team as to the suitability of using Form 4 Type 6 panel boards which are commercially available through a handful of suppliers. Final distribution boards will be constructed to the requirements given in 8.3.2.2.22, not 8.3.2.2.10 | Agreed to refer to VE items (Opportunities) where this issue is 'live' - any adjustment/change will be governed by Change Control. | Agreed that ER requirement remains, this item to be addressed via commercial mechanisms (VE and Early Warning) thorugh the contract. |
| 55 | 8.3.3.1.11 | Treatment Room Circuitry | Luminaires within Treatment Rooms will each be fed from a single circuit, however, a minimum of two circuits will be provided in each Treatment Room. As agreed in RFI entry 009. | | Agreed |
| 56 | 8.3.2.2.13 | Tower Ward Clinical Risk category | The ER's state that these shall be Clinical Risk Category 3 however the agreed entry (002) within the RFI log amends this to Clinical Risk Category 4. Note that power within these areas will not be provided by UPS/IPS. | | Agreed |
| 57 | 8.3.3.1.9 | | All signage is to be illuminated - This will be done with normal ceiling lighting, supplemented where required. There is no intention to provide illuminated signage. | | Approach and solution to be agreed through Signage Strategy during Stage 3 design development. |
| 58 | 8.3.3.1.12 | | Indicates that lighting is part of the bedhead - We are considering mounting the 2 circuit luminaire above the bedhead trunking, but controlled from the bedhead trunking | Details to be submitted for consideration | Agreed ER requirement to remain. Details to be submitted for review and comment by the Board as part of the Stage 3 design development. Add to Stage 3 Design Development Watchlist. |
| 59 | 8.3.3.1.13 | | Indicates that there is bedhead and overhead schemes in interventional and treatment rooms. - the lighting will be ceiling only incorporating dimmable lighting to achieve the mode required. | | Agreed that 1:50 room layouts identify requirement. |
| 60 | 8.3.3.1.14 | Luminaire Placement | Mercury to respond on the placement of luminaires above patient positions. Indicates that there are lights above all bedheads. This applies only to ward areas. | In Stage 3 watchlist | Agreed that ER requriement remains, practical application of getting ceiling grid to avoid all patient spaces in recovery to be raised in Stage 3 Design Development. Will be demonstrated in 1 50 reflected ceiling plan session in early 2011 with proposals submitted for Board review and consideration. To go on to Stage 3 Design Development Watchlist. |
| 61 | 8.3.3.1.15 | | Indicates that the bedhead unit is controlled from the door. This is not proposed, there will be lighting provided in each bedroom controlled from the door to allow staff to get to the bedhead and adjust the lighting on the bedhead to the required levels. | | Agreed that overhead lighting is controlled at the door with overbead lighting controlled at each bed. |
| 62 | 8.3.3.2.7 | Lighting | indicates that isolation devices are required at all luminaires - it is intended to install a Rock rose socket for each luminaire located above the ceiling to allow each luminaire to be removed. This is not an isolation device. | Agreed | Agreed |
| 63 | 8.3.3.2.8 | Lighting | indicates that corridors and circulation areas are 2 way and intermediate switched - it is proposed to have one circuit permanently on and the other on PIR control. This approach is safer and more efficient. | Agreed | Agreed |
| 64 | 8.3.3.2.11 | Lighting | indicates that switches are to be engraved - it is proposed to use proprietary self adhesive printed labels as an alternative to prevent infection control issues. | Are adhesive printable labels cleanable - yes. | Board requirement to be concluded during Stage 3 Design Development. |
| 65 | 8.3.3.2.12 | Lighting | indicates that there will be circuit labels at all electrical accessories - it is proposed to use proprietary self adhesive printed labels as an alternative to prevent infection control issues. | ditto | Board requirement to be concluded during Stage 3 Design Development. |

| | | | | | |
|---|---|---|---|---|---|
| 66 | 8.3.3.3.1 | Lighting | Indicates that the emergency lighting self test/monitoring system reports to the BMS - the system is standalone and the Head End located in the FM building. | BMS will monitor the system (high level). Dali system control on open BMS is proposed but under development. | ER remains, specific proposals to be devleoped and proposed to the Board during the Stage 3 design development. To go on to the Stage 3 Design Development Watchlist. |
| 67 | 8.3.3.3.2 | Lighting | indicates that the emergency lighting circuits are monitored - The emergency luminaires are monitored. | Agreed | Agreed |
| 68 | 8.3.3.5.1, 8.3.3.5.2 & 8.3.3.6.4 | Wiring | Wiring within all areas (clinical & non-clinical), with the exception of plantrooms where the wiring will be as per 8.3.5.1, may be provided by modular wiring systems. 8.3.3.5.2 states that modular wiring may be considered but only in non-clinical areas.<br>Modular wiring to be considered in non-clinical areas - ward areas are intended to be wired with Modular wiring. Should<br>Modular wiring systems be provided they will be robust and will allow for future growth | Principle agreed, Stage 3 Design Development to provide details for review/comment. | Agreed that principle of proposal acceptable on the basis tha t acceptable details are proposed and agreed as par t of the Stage 3 design development. Add to Stage 3 Design Development Watchlist. |
| 69 | 8.3.3.6.1 | Small Power Wiring | MEIGaN applies only to the imaging suites. | BCL to give details (see item 17) | Agreed that both IPS and MEIGaN lists are reflective of requirement and noted that these will adjust with the design development to settle on exact rooms for the final solution. |
| 70 | 8.3.3.6.2 | Small Power Circuits from IPS | Clarification that small power circuits will only be provided from Insulated Power Supplies in those areas defined as group 2 by IEE Guidance note 7 and areas requested by the Board following the Boards Clinical Risk Category review. | not yet agreed - BCL to provide listing | Agreed that both IPS and MEIGaN lists are reflective of requirement and noted that these will adjust with the design development to settle on exact rooms for the final solution. |
| 71 | 8.3.3.7.9 | | Indicates that the BMS controls the external lighting - it is proposed to provide photocells in all external lights such that there is a facility at each column to connect to other items such as signs etc. Where this is not practical, such as bollards, then these shall be controlled on a circuit basis via a photocell. Similar circuits may be controlled by timeclocks as necessary. | Single photocell can have all lights out pan-site if it fails. Multi-cells give better coverage by individual location but can create legacy maintenance issue. | Agreed that individual photocell proposal is acceptable with BMS contrlol to remain a feature of the proposal. Specific details to be submitted for Board review and comment during Stage 3 design development. |
| 72 | 8.3.4.9 | | Link to Hillington - this link and Hardware at Hillington to be provided by the Board. Export facility will be provided. | This can be done via provider data centre (Schindler first and then to Board) | Agreed |
| 73 | 8.3.4.19 | Fire Suppression Systems | These will be provided to the 2no. Server Rooms only. | Fire management solutions in sub-stations to be agreed. Helipad Fire requirements specified elsewhere. | Agreed that ER requirement is provided in respect of Server Rooms. Sub-station and Helipad requirements to be further developed and submitted to Board for review and comment as part of the Stage 3 design development. |
| 74 | 8.3.4.25 | Fire Alarm System Cabling | ERs ask for all wiring to be MICC with red LSF sheath. We propose that all cables shall be the types specified in BS5839 and be of red outer sheath and of the low smoke, zero halogen type (commonly referred to as LSF). All cables, including power cables and network cables, associated with the Fire Detection and Alarm System shall be of the enhanced type, meeting the PH120 classification when tested in accordance with BSEN 50200 and the 120 minute survival time when tested in accordance with BS8434-2. These may not be MICC but will satisfy the above criteria. | The ER requirement is for MICC cable and this will require to be formally varied. An EWN has already been raised in relation to this so this log will not address any change to specification of this item. | Agreed that any change to specification or acceptance of alternative compliance specification will be addressed via commercial contract provisions. |
| 75 | 8.3.5.13 | | indicates 2 lines. One to the lift company and one to Hillington - this is not in compliance with EN81 and as such this cannot be provided. If the line was put to Schindler data Centre then Hillington could be the primary contact if required. One line will be required to each lift, this will be an analogue line by the Board. | This can be done via provider data centre (Schindler first and then to Board) | Agreed |
| 76 | 8.3.6 | Information Technology Equipment & Distribution Systems | no non compliance proposed at this time. However design development and integration across anumber of system may lead to some divergance from ER's. | Any non-compliance with documents listed as mandatory within the ER's will require to be agreed with NHS GG&C. Conflicts raised in the evolving design design moving forwards should be highlighted for discussion. | Add to Stage 3 Design Development Watchlist |
| 77 | 8.3.8 | Wireless Networks | no non compliance proposed at this time. However design development and integration across anumber of system may lead to some divergance from ER's. | Any non-compliance with documents listed as mandatory within the ER's will require to be agreed with NHS GG&C. Conflicts raised in the evolving design design moving forwards should be highlighted for discussion. | Add to Stage 3 Design Development Watchlist |
| 78 | 8.3.9 | External Services (WAN) | no non compliance proposed at this time. However design development and integration across anumber of system may lead to some divergance from ER's. | Any non-compliance with documents listed as mandatory within the ER's will require to be agreed with NHS GG&C. Conflicts raised in the evolving design design moving forwards should be highlighted for discussion. | Add to Stage 3 Design Development Watchlist |
| 79 | 8.3.11 | Data Patch Panels | no non compliance proposed at this time. However design development and integration across anumber of system may lead to some divergance from ER's. | Any non-compliance with documents listed as mandatory within the ER's will require to be agreed with NHS GG&C. Conflicts raised in the evolving design design moving forwards should be highlighted for discussion. | Add to Stage 3 Design Development Watchlist |
| 80 | 8.3.13.2 | Public Address System - Emergency Messaging | Pre-recorded coded emergency messages will not be provided. No voice alarm system being provided. | | Agreed |
| 81 | 8.3.14 | Staff Location System | no non compliance proposed at this time. However design development and integration across anumber of system may lead to some divergance from ER's. | Any non-compliance with documents listed as mandatory within the ER's will require to be agreed with NHS GG&C. Conflicts raised in the evolving design design moving forwards should be highlighted for discussion. | Add to Stage 3 Design Development Watchlist |
| 82 | 8.3.18.1 | Induction Loops | Fixed induction loops will be provided to reception areas - portable to other areas. | | Agreed that fixed induction loop is required in reception (and associated waiting and ancillary areas), audiology department and sanctury areas. Portable infrastructure to be provided in all other areas of the Hospitals. |
| 83 | 8.3.24 | Paging | no non compliance proposed at this time. However design development and integration across anumber of system may lead to some divergance from ER's. | Any non-compliance with documents listed as mandatory within the ER's will require to be agreed with NHS GG&C. Conflicts raised in the evolving design design moving forwards should be highlighted for discussion. | Add to Stage 3 Design Development Watchlist |

| | | | | | |
|---|---|---|---|---|---|
| 84 | 8.3.25.2 (e) | Local Intruder Alarm Systems | Local intruder alarm systems will not be provided to plant rooms. This was 'agreed' with the Board. | Cross-check to be carried out. | Agreed that local intruder alarm systems to be developed during Stage 3 design development process. Controlled (and logged) entry to plantrooms required rather than local alarms, alarms and logged entry requirements for Comms Rms to be agreed. Alarms and Logged Entry to be added to Stage 3 Design Development Watchlist. |
| 85 | 8.3.30.2 | UPS Lighting | this is limited by suitable risk assessment and applies to clinical risk category 5 only. This is as detailed in Healthcare Interpretation of IEC Guidance Note 7. | Agreed | Agreed |
| 86 | 8.3.30.3 | UPS in Critical Care | This is detailed in Healthcare Interpretation of IEC Guidance Note 7. We will provide non standard sockets if necessary but this is in contradiction to GN7 and also means that all equipment would need to be fitted with special plugs. Please keep to GN7. | Agreed, standard sockets to be colour coded. | Agreed, standard sockets to be colour coded. |
| 87 | 8.3.31.4 | Active Mimics at Switchboards | This may be interpreted as giving the opportunity to short circuit electrical safety systems by giving remote operating positions. On Health and Safety grounds this should not be provided and if lft in could endanger many people and shutdown power to the Hospital. Control should be from the power control heads, only, in the Energy Centre and the Intake Substation. A window on the system will be provided in the FM Control Room. | Agreed - no active mimics (see 54) | Agreed - no active mimics |
| 88 | 8.3.31.7 | | Delete all and comply with SHTM 06-01 | Principle of compliance with 06-01 agreed, detail to be developed during Stage 3 (06-01 to be followed and met) | Principle of compliance with 06-01 agreed, detail to be developed during Stage 3 (06-01 to be followed and met) |
| 89 | 8.3.31.17 | | this is reduced to 1500 litre to minimise fire load. | Principle agreed, subject to value engineering outcome. | Principle agreed, subject to value engineering outcome. |
| 90 | 8.3.34.2d | Lifts | Indicates that consideration shall be given that lifts will serve all floors. We propose rationalising this with on-going discussions with the Board and sketch XX-YY | The clause indicates that all floors shall be served by lifts, not that every lift shall serve every floor. The ER requirement is unchanged and the principles agreed in discussion of sketch XX-YY are agreed. | Agreed |
| 91 | 8.3.34.2g | Lifts | Indicates that consideration be given to install two lines to each lift , one for alarm and one for maintenance - Only one line will be used and it will be directed to the Schindler Response Centre who will monitor the lifts and respond to emergencies. Schindler would be set up to respond directly to the Board's Central Communication Centre. This is in accordance with EN81, the Lifts European Directive. Should the Board wish to change this after PC then they are at liberty to do so as long as they comply with the requirements of EN81. | | Agreed |
| 92 | 8.3.34.2n | Lifts | Indicates that consideration be given to use conventional lift types p Machine Room-less lifts (MRL) are being provided in all locations. | | Agreed |
| 93 | 8.3.35 | Tagging | Outside of ZBP scope. | **Ancillary note: Board to consider presently for the Laboratories (tagging and HFS input) to clarify requirement.** | Agreed that ER requirement to remain. Specific tagging requirement, optionsand HFS offering to be determined and agreed during Stage 3. Add to Stage 3 Design Development Watchlist. |
| 94 | Appendix M&E 1 | | Assumed to be replaced by Utility Application | BCL to provide narrative to identify their requirement/outlook. | Current design is inline with all sections within this appendix, all drawings referred to are superseded by Appendix K versions. |
| 95 | Appendix M&E 2 | | To be commented upon | ER Appendix will be complied with | Agreed |
| 96 | Appendix M&E 3 | | To be commented upon | ER Appendix will be complied with | Agreed |
| 97 | Appendix M&E 4 | | To be commented upon | ER Appendix will be complied with | Agreed |
| 98 | Appendix M&E 5 | | To be commented upon. MERCURY ENGINEERING to confirm system architecture, etc. | Complying with M&E 5 - some design specifics to be raised and agreed during subsequent design development. | Agreed that ER Appendix M&E5 remains, subject to the 4 items noted below |
| | 98a | 1.3 Para 2 | Perimeter Rooms generally have individual occupant control, but internally grouped rooms where this is not practical, will use area averaging control. | PART OF DISCUSSION WITH REGARD TO VENTILATION AND CONTROLS | The under noted is Agreed, on the basis that it only applies to the Acute Assessment Unit and that it is subject to demonstration of satisfactory details of proposals and controls during the Stage 3 Design Development. Agreed In Principle therefore and moved to Stage 3 Watchlist.The environmental systems in the Acute Assessment ward comprise mechanical ventilation and radiant heating panels the latter with local control. The radiant panels satisfy the heat losses and the ventilation the heat gains. As the assessment wards are used for short periods of time the internal heat gains do not vary greatly and therefore having a multiple room control will not greatly vary the internal summertime temperature. The critical care areas have an all air system and are grouped such that one heater battery serves a series of two or three bed bays. Each of the groups of bed bays have a similar aspect and solar gains/heat losses and as they are of the same use have similar internal gains. The bays are also open/curtained bays and so could not be treated individually. Therefore grouping the room control should maintain the space condition within the required limits |
| | 98b | Paras 3 & 4 | As discussed with the Board at review meeting held on 1st September 2010 indication of this type is not required | Para 3 - it is agreed relates to signage Para 4 - not applicable as building is sealed | Para 3 - it is agreed relates to signage Para 4 - agreed not applicable as building is sealed |
| | 98c | P.16 Line 14 | Clarify Decontamination Tracking | | Agreed that Washer Disinfectors likely to be linked to BMS and that scopes to have tagging and tracking system inbuilt. Specifics of Decon items that require to 'talk' to BMS and basis of this (e.g. constant status versus fault alarm) and related requirements to be agreed during Stage 3 design development. Add to Stage 3 Design Development Watchlist. |
| | 98d | P.16 Line 16 | Clarify list of major health equipment and whether facilities are provided on equipment to provide 'Status' and 'Fault'. Agreed not required at meeting on 1st September 2010. | | Agreed that ER requirement to remain. Specifics of Major Equipment Items that require to 'talk' to BMS and basis of this (e.g. constant status versus fault alarm) and related requirements to be agreed during Stage 3 design development. Add to Stage 3 Design Development Watchlist. |
| 99 | Appendix M&E 6 | | Assumed replaced by Stage 1/2/3 Design Proposals | ER Appendix will be complied with | Agreed |
| 100 | Appendix M&E 7 | | Swisslog to comment on PTS & AMT compliance | ER Appendix will be complied with | Agreed |

| **Folder Z** – Unallocated | Unallocated |

***Removal of Mandatory Maximum Temperature Variant.***

*The maximum temperature variant has been removed from the bid requirements, the bidders shall put forward schemes to ensure thermal comfort and avoid overheating.*

*Sustainability has a major input into the project and all solutions must seek to minimize $C0_2$ and energy usage, however this must not be at the expense of thermal comfort and avoidance of over heating.*

For design purposes the level of thermal comfort shall be:

Room temperatures should not go below 18 $^{o}$C in winter for longer than 2 hours at a time, or higher than 26$^{o}$C in summer for more that 50 hours in total, but not on successive days.

*Feasibility studies are to be carried out into the potential use of low and zero carbon technologies to reduce carbon emissions associated with the operation of the building.*

*The bidder's attention is drawn to the Employers Requirements and in particular the following sections:*

***Appendix M&E3***
***Paragraph (Extracts)***

*2.4.3 Chilled Beams*

*The use of active chilled beams should be considered within all ward areas.*

*Active chilled beams will provide tempered, filtered air together with heating and comfort cooling of the space; thus providing effective local control of the environmental conditions.*

*2.4.4 Thermal Comfort*

*High levels of comfort are required for all users; in particular staff and patients.*

*Openable windows can be used as part of the ventilation strategy, and it is necessary to ensure that other, often contradictory requirements such as restricting openings for safety reasons, are met.*

*In perimeter spaces where mechanical ventilation is provided for functional reasons a mixed mode approach is a possible solution.*

*2.4.5 General Chilled Water*

*Sustainable cooling shall be used where possible with conventional chilling (with free cooling coils) used as required as a top up and to provide system resilience, all lower carbon means of supplying cooling such as bore holes, piling systems and absorption chilling must be fully investigated and chosen if there is a carbon advantage over conventional cooling.*

*Chillers shall be selected to operate at design duty with an external ambient temperature of 30$^{o}$C dry bulb.*

*Chillers to have variable speed head pressure control with load and efficiency optimized head pressure and chilled water flow temperature control to improve seasonal efficiency.*

*3.1 External Design Temperatures*

| | | |
|---|---|---|
| *Summer* | *26.2°C DB* | *18.5°C WB* |
| *Winter* | *- 6°C* | |

*Global warming potential shall be considered and the Contractor shall provide suggestions for dealing with this under the innovation section of the tender return documents.*

***Appendix M&E2***
***Paragraph (Extracts)***

2.3 Cooling Load

The Cooling requirement shall be developed by the Contractor for the ~~standard and max temp mandatory variant~~ bid~~s~~, all cooling shall be provided by the most efficient method including, absorption chillers, free cooling etc.

5.0 25% uplift for power to main hospitals.

***Section 8***
***Paragraphs***

8.1.7 Thermal Comfort – (full contents)

8.1.8 Air Quality – (full contents)

8.2.11.3 The need to maintain the specified comfort conditions in all areas but particularly in clinical areas is of paramount importance and the Contractor shall develop strategies for achieving the specified environmental conditions with minimum energy consumption.

8.2.11.5 It is essential that the Contractor designs and provides ventilation and air conditioning systems which will ensure occupants comfort. This shall be achieved by use of well tested design principals and suitable plant selection. Air flow problems must be avoided by accurate system balancing, correct selection and location of air diffusers to prevent high air velocities and stratification together with adequate air volumes and accurate temperature control.

8.2.11.8 Air changes shall be in accordance with CIBSE guides, SHTM's, HTM's and Building Regulations.

8.2.11.10 Ensure heat gain from all Equipment and personnel is allowed for in sizing and selection of the systems.

8.1.25 In accordance with Good Industry Practice, all plant, plant spaces and building services systems shall be specifically designed and provided with defined reserve capacity allowances and future expansion capabilities for the Facilities (e.g. distribution boards with 25% spare capacity, 25% additional containment, 25% spare capacity in distribution Pipework, 25% additional plant capacity, 25% additional cooling capacity, 25% additional air handling capacity etc. for the buildings as designed).

NHS Greater Glasgow and Clyde

# Building The Hospital

## Queen Elizabeth University Hospital and Royal Hospital for Children – Why the site was chosen

### Background

Throughout the western world hospitals and the services they provide were changing fast. Many of the most important services were on a "same day" basis – in out-patient clinics, minor injuries units, X-ray and rehabilitation departments, day case surgery. Doctors were becoming more specialised – especially in surgery – and there was growing evidence that specialist teams got the best and safest results, especially where the illness or injury was most serious.

Patients expected faster, more convenient services in patient-friendly modern surroundings, and the confidence of knowing the very best people were in the place they were needed
most.

In Glasgow, there were too many dilapidated old buildings with scattered services and dispersed staff. Hospital services were not fit for the 21st century.

It was decided that only a major redesign of services could give people in Glasgow the standards of service they should expect.

Many cities had tackled this problem by closing some of their large acute hospitals, sometimes replacing them with new ones on the edge of the city or town. We did not want to go down this route – but at the same time, doing nothing was not an option.

Since the autumn of 1997, wide-ranging discussions had been held across Glasgow and
rrounding areas about the sort of services patients needed.

Three main messages emerged:

- Local people wanted local access for as many services as possible.
- A population the size of the south side (350,000 people) needed one comprehensive set of well-staffed specialist services rather than numerous over-stretched and patchy sets of services.
- There was an urgent need for modern well-designed user-friendly services and buildings.

On the face of it, the second of these options was not easy to reconcile with the first. But the development of “same day” services (known as “Ambulatory Care”) provided a way in which the city could fully achieve the second (essential in the interests of safety and best possible results in diagnosis and treatment) and at the same time get very close indeed to also fully providing the first.

The third message – the need for modern, well-designed, user-friendly facilities – led to investigations into a range of options, including the creation of a new hospital on a new central site.

## What was the pattern of services at the time?

The South Glasgow Trust services were provided from five sites:

### Victoria Infirmary

Served a population of approximately 200,000.

Busy Accident and Emergency Department, and offered a range of acute district general hospital services.

Its buildings mostly dated from phased development in the second hjalf of the 20th century. Links between related departments were often poor and it was increasingly difficult to provide modern diagnostic and treatment methods.

A number of services were integrated between the Victoria Infirmary and Southern neral Hospital (i.e. ENT, eyes, Urology, Dermatology and Maternity) and for these services inpatient and day case facilities were only at one or other site.

## Southern General Hospital

Served a population of approx. 150,000

Not only provided the full range of district general hospital but had a number of specialties which serve not only the whole of South Glasgow but Greater Glasgow, the West of Scotland and further afield – i.e. National Spinal Injuries Unit, Institute of Neurosciences, WestMARC (the wheelchair and artificial limb service), and Oral and Maxillo-facial Surgery.

The emergency and trauma nature of the specialties located at the Southern General required good access to the motorway network and helicopter access – the site's location and large campus made this possible. Although some parts of the Southern General were in old buildings, it also had some 600 beds in modern facilities.

Mansionhouse Unit: Unit for assessment, rehabilitation and continuing care for the elderly.

Cowglen Hospital: 120 beds for elderly continuing care.

Mearnskirk House: 72 beds for elderly continuing care provided under a PFI arrangement.

## What was being proposed?

The plan was to create a new single set of facilities for in-patient services on one site to serve the south side, with a new, state-of-the-art Ambulatory Care Centre at the Victoria Infirmary.

The idea had strong support among south side doctors, and it had been supported in much of the wider public debate that had already taken place.

## The rationale

At the time, the south side had to maintain two 24-hour rotas in orthopaedics, general surgery and gynaecology when the workload to be covered could be dealt with by one.

Having two rotas instead of one added to the longstanding problem of junior doctors working scandalously long hours and often meant less consultant time was available to tackle waiting times for clinics and operations.

A single set of specialist services for the south side meant that specialist teams could be larger, and with their beds concentrated together their time could be used more effectively, so keeping waiting times down.

There was a strong desire for a single “A & E Department”. This would allow more consultant presence in dealing with serious cases for a greater part of each 24 hour period than is the case at the moment – it would be a major step forward in quality of service.

The proposal to include a Minor Injuries Unit in the new Ambulatory Care Centre at the Victoria maintained local access for the great majority of people who used the Victoria Infirmary at the time.

A & E Department. A very similar service has existed at Stobhill for years – people are very pleased with it and there have been no problems about its safety.

Our leaflet on Accident and Emergency Services goes into detail about the concerns that people have expressed about longer ambulance journey times in cases where someone has had a heart attack or very serious accident.

## The options for a single in-patient site

We looked at five options:

1. A new Ambulatory Care Centre at the Victoria Infirmary and a completely new hospital for in-patient services on a new site reasonably convenient for everyone on the south side.
2. A new Ambulatory Care Centre at the Victoria Infirmary and creating a completely modern in-patient hospital at the Southern General by demolishing old buildings and constructing new ones. (These two options are explained more fully later)
3. In-patients at the Victoria Infirmary site with Ambulatory Care Centre at the Southern General.

This was rejected because it would have made access to major Accident and Emergency services in the city unsuitable for patients from the west of Greater Glasgow. In addition, the Victoria Infirmary site (11 acres) was too small to accommodate all of the services that would be required.

4. All services at the Victoria Infirmary.

   Rejected for the same reasons. It would also deny to the residents of South-West Glasgow the ease of access to an acceptable range of local services.

5. All services at the Southern General.

   Rejected because it did not give any local access to services for residents of SouthEast Glasgow.

## Child and Maternity Services

In looking at Options 1 and 2 the Trust explored whether it was also decided to consult on re-locating the Yorkhill Children's Hospital services to the south side. The view was that there were good clinical reasons for considering it and it would also help to ensure that maternity in-patient services remained securely in South Glasgow.

## Option 1 – "A New Site Hospital"

Three possible sites were identified:

- In the Pollok area a site of approximately 44.7 acres, incorporating the Cowglen Hospital and the National Savings Bank (NSB), bounded by Boydstone Road, Barrhead Road, M77 motorway and Kennishead Wood. Additional adjacent land to the south of Cowglen Hospital would be needed to accommodate all the possible services.
- 73.6 acres incorporating the Pollok Playing Fields, leased to the National Savings Bank and land owned by the Pollok Estate.
- 80 acres at Darnley Mains adjacent to the M77 and next to B & Q Warehouse.

After further investigations, Site 1 was considered the one worth detailed consideration.

It would have meant closure, demolition and sale of the Victoria Infirmary, Mansionhouse it and most of the Southern General Hospital site.

The cost of building a new in-patient hospital at the Cowglen site and an Ambulatory Care Centre at the Victoria Infirmary was estimated at £346.4 million (assuming financing under Public Private Partnership), with annual running costs of £18.4m.

These figures did not include the cost of buying land from NSB or the owner of the field adjacent to Cowglen Hospital. However, it was estimated that around £22m in receipts from selling land at the Victoria Infirmary, Mansionhouse Unit, Southern General or Yorkhill would help off-set this cost.

There were, however, some significant risks with this option:

- It would be a hospital of around 1,400 beds, and would take around seven years to build. The South Glasgow Trust would have to commit itself to that number of beds with no chance of adjusting the size of the hospital downwards if required.
- The land needed might not have been available for sale or might have been extremely expensive given its zoning for retail or commercial use.
- Building a hospital of this size in a single phase had not been attempted in the UK before. This could have pushed up the cost to reflect the increased risk of over-runs.
- Because of the intensive traffic flows in the area, it was not known whether the project would create town planning or road infrastructure requirements that would add to the cost.

## Option 2 – "Redeveloping the Southern General"

The Southern General sat on 67 acres of land, and its geographical location close to the M8, M77 and Clyde Tunnel made it very accessible to ambulances and the public.

In the previous decade or so the hospital had benefited from around £60m of capital investment to provide new or substantially upgraded facilities. The site also had a range of modern in-patient facilities so there was a significant basis around which a new hospital could be developed.

A redevelopment of the existing Southern General Hospital site would mean closure, demolition and sale of the Victoria Infirmary and Mansionhouse Unit.

A proposed three-part development over a ten-year period, to provide a new Southside hospital based around the existing investment, would carry a total cost of £241.8m.

This option carried fewer risks around calculating bed numbers, land availability, local traffic or project complexity.

However, there was a risk that the third part of the redevelopment might not proceed if government or Health Board policy changed after completion of the first contract. There was also concern around risk of disruption to existing services as buildings would be demolished and constructed in the centre of existing facilities.

## Choosing between the two options

Both options included provision for a new Ambulatory Care Centre and 120 rehabilitation beds. In addition, they both included a "23-hour elective surgery" service at the Victoria Infirmary which would allow minimally invasive surgery and treatment to be given to those patients needing one overnight stay to aid their recovery.

The differences between the options lay in four areas – accessibility, speed of completion, risks and cost.

While it was estimated that the Cowglen option would be completed earlier, in all other areas the balance was in favour of the Southern General option.

## The Consultation

In April 2000, public consultation on Modernising Glasgow's Acute Hospital Services began, with the one of the key considerations being the creation of a newly built hospital for the south side of the city. The Southern General was the preferred site for the project.

After seven months, the Greater Glasgow Health Board announced that it was confident its five key aims had widespread recognition and support. The five aims were:

- Modern facilities for a better patient experience.
- Creating larger specialist teams of doctors in order to assure more continuous availability of specialties and to tackle new requirements governing the working hours of senior and junior doctors.

- Maintaining local access for as much of the city's population as possible.
- Creating a pattern of hospital services that made sense across Glasgow as a whole.
- Levering in major capital investment in a way that was affordable.

## The preferred site

The Greater Glasgow health board was proposing a new hospital on the site of the Southern General. It would be a completely new construction, with the exception of:

- The Institute of Neurosciences (including the new Maxillo-facial and ENT units).
- The Spinal Injuries Unit.
- Westmarc.
- Podiatry Department.
- The new PFI wards for the elderly.
- The maternity unit (subject to consultation).

However, in making its case for the Southern General site, the board recognised there was considerable backing for a greenfield site option, at Cowglen.

It proposed that the outline business case should compare the Southern General, Cowglen and a third option to do nothing.

## What happened next – the key dates

**June 2002**: The Scottish Government Health Secretary approves the city-wide Acute Services Strategy, including the new hospital at the Southern General.

---

**2004**: Health Secretary announces funding for new Children's Hospital to be built on a site that will allow "triple" location of services.

---

**2005**: Option appraisal for location of new Children's Hospital (Calder Group).

**2006**:

**March**: Calder reports – children's hospital to be sited at Southern General Hospital.

**April**: Dissolution of Argyll & Clyde Health Board – merger creates Greater Glasgow and Clyde Health Board.

**May**: Project Director appointed for the new South Glasgow Hospitals.

---

**2007**:

Project Initiation Documentation agreed by the Project Executive Group.

**April**: Outline Business Case (OBC) for maternity services approved.

---

**2008**:

**January**: Outline (town) Planning approval given.

**February**: OBC for hospital project approved by Board.

**April**: OBC approved by Scottish Government and work on Full Business Case (FBC) begins.

**May**: FBC for maternity services approved.

---

**2009**:

**February**: Advert for construction placed in the Official Journal of the European Union. Open Day held at Hampden Park.

**May-August**: Competitive Dialogue takes place.

**September**: Tenders returned to Board and evaluation commences.

**4 December**: FBC for labs development approved.

**18 December**: Brookfield appointed as preferred bidder.

---

**2010**:

**July**: Mock-up rooms created at Ibrox for public viewing.

**October**: FBC approved by Board.

**December**: FBC approved by Scottish Government.

**December**: Contract for Brookfield to build hospitals.

---

**March 2011**: Construction of Adult and Children's Hospitals commences.

---

**March 2012**: Labs building handed over.

---

**June 2013**: Hospitals "topping out" ceremony.

---

**March-December 2014**: Programme of site visits for staff.

---

**2015**:

**26 January**: Hospitals handed over to health board.

**April**: Migration of Adult Hospitals commences.

**June**: Final migration phase – migration of Children's Hospital.

**July**: The new hospital is granted the right to use the name "Queen Elizabeth University Hospital" by Queen Elizabeth II. Its original name had been South Glasgow University Hospital.

---

**Summer 2016**: Queen Elizabeth University Hospital campus is fully operational.

# 1. EXECUTIVE SUMMARY

## 1.1 INTRODUCTION

The purpose of this Outline Business Case (OBC) is to present proposals for the development of an integrated Children's and Adult Hospital and a new laboratory build on the site of the current Southern General Hospital.

The proposals represent the largest investment in health services undertaken in Scotland and form a major part of NHS Greater Glasgow and Clyde's Acute Services Strategy to modernise health services.

This investment will transform the experience of healthcare for patients and staff alike with Glasgow becoming the home to the largest, most advanced single NHS development delivering gold standard hospitals on the Southern campus.

A jewel in the crown of NHS Scotland, the new hospital campus will provide maternity, paediatric and adult acute services together on the one site. This will ensure immediate access to specialist services of all kinds and therefore the highest quality and safety standards for adults, children and babies alike.

The construction of the new hospitals will give opportunity to redesign radically the way in which health services are delivered and reappraise the skills and profile of the workforce tailoring delivery of modern health services in keeping with the 21st century.

The campus will have excellent transport links. Capitalising on its location besides the M8 motorway, the campus car parking capacity will more than double from the current 1400 spaces to over 3,500 spaces. Public transport will be significantly improved with many of the bus services which currently travel around the site, going through the new site. A network of new bus services providing direct access from South Glasgow will complement the existing 50 buses an hour that currently travel to the site. Major investment will be made to connect cycle and pedestrian pathways to Glasgow's core paths networks to make it easier for staff in particular to walk or cycle to work.

As one of the largest single investments in the south of the city the development has the potential to regenerate and breathe new life into Govan and the wider area. Liaison is taking place with Scottish Enterprise and a number of other external organisations to establish a New Hospitals Engagement Forum to realise this potential and bring added value to the new hospitals project.

The Health Board has been engaging with the Scottish Government to agree the format and content of the Outline Business Case, the outcome is reflected within this document.

## 1.2 THE CASE FOR CHANGE

NHS Greater Glasgow & Clyde recognise the need to ensure that patients who require access to hospital care can be seen, fully investigated and treated as quickly as possible within the appropriate facilities. For patients presenting as an emergency there should be access to specialised care of the highest quality, with access to state of the art investigations and treatment facilities on a 24 hour /7days a week basis. For elective care, patients should be seen, investigated and leave the hospital with a diagnosis and treatment plan wherever possible on the first visit. Underpinning this should be effective information and computer systems which allow GPs, Specialists and patient access to all relevant information needed to deliver high quality and effective patient care.

In 2002 Greater Glasgow Health Board described the case for change, which identified that the status quo was not an option, as there was significant challenge to the sustainability of the configuration of services and to the ability to improve patient pathways and create more efficient and effective care pathways. All of the factors identified remain relevant today with additional challenges and pressures resulting in even greater need to reduce hospital sites and duplication of services. In brief the issues are:

- The need to achieve the objectives of the guidance in 'Better Health, Better Care' and other key national policies. These policies drive reductions in waiting times; fast track access to rapid diagnosis and treatment; provision of services designed around the needs of the patient; modernisation of healthcare through better use of technology and improved integration with primary and social care reducing inequalities in health. To achieve these objectives a major programme of investment in buildings, information technology and redesign of services is required.
- Fragmented services, there is a requirement for patients to move within and around sites and different buildings with an inevitable loss of continuity of patient care, important co-locations of services are not possible and difficulties arise in transferring information between services.
- Increasing sub-specialisation in medicine and surgery and an increasing need to move towards larger teams to ensure all patients can access the appropriate Specialist on a 24hours a day and 7 days a week basis.
- Pressures on staff in sustaining appropriate staffing levels, for example Modernising Medical Careers and the European Working Time Directive impact upon the availability of medical staff and therefore on the sustainability of multiple rotas.
- Outdated buildings unsuitable and unfit for modern healthcare offering a poor patient environment with unsuitable facilities for modernising services, restricting capacity and creating bottlenecks and delays in treatment.

## 1.3 ACUTE SERVICES REVIEW (ASR)

The health services in Glasgow have entered a period of dramatic and exciting change. Following a decade of planning and public consultation, proposals to modernise the acute health services in Glasgow were approved in 2002 by Malcolm Chisholm, Minister for Health and Community Care.
The components of the acute service strategy are as follows:

- A new Beatson West of Scotland Cancer Centre at the Gartnavel General site (2007).
- Two Ambulatory Care and Diagnostic Hospitals on the Stobhill site and on a site adjacent to the Victoria Infirmary site, this will support the future reduction from 6 to 3 adult inpatient sites.
- A reduction in Maternity services from three sites to two, those being the Princess Royal Maternity Hospital at Glasgow Royal site and the redeveloped maternity facility on the new southern campus.
- In North Glasgow, acute in-patient services will be provided from Glasgow Royal Infirmary and Gartnavel General Hospital.
- In South Glasgow, acute in-patient services will be provided from a major new development at the Southern General Hospital.
- Full A&E services will be provided from two sites, located at Glasgow Royal Infirmary and the Southern General Hospital.
- Trauma and Orthopaedic in-patient services will be provided from the two full A&E sites. Orthopaedic out-patient and day case services to be provided from all five adult sites (Gartnavel, Stobhill, GRI, Victoria and Southern General).

- Minor Injury Units will be provided from all five adult sites.

In 2004 the Minister for Health and Community Care announced that the Scottish Government would provide £100 million to enable a new children's hospital to be built on a site which would support the "triple co-location of services". The Royal Hospital for Sick Children is currently co-located with the Queen Mothers Hospital (QMH). The planned closure of the QMH, and the transfer of its activity and services to the Southern and Glasgow Royal sites, will leave the Royal Hospital for Sick Children (RHSC) isolated. Following an option appraisal in 2005, of potential locations for the new children's hospital, the Southern General site was identified as the only location to offer both co-location with maternity and adult services and appropriate vacant land for building. This process was undertaken in collaboration with a Ministerial Advisory Group chaired by Professor Andrew Calder. The report of that Group, published in March 2006, affirmed the selection of the Southern General site as the location for the new children's hospital. This recommendation was accepted by the Minister for Health and Community Care in 2006 following a period of consultation.

A review of laboratory services was carried out to identify the optimal configuration of laboratory services in Glasgow to support the Acute Services Strategy. The preferred option involves: centralising the majority of laboratory services into two main sites at Glasgow Royal and the Southern site; consolidating immunology, tissue typing, stem cell lab work and all other laboratory services associated with leukaemia research and Haemato-oncology onto the Gartnavel site co-location with the West of Scotland Cancer Centre; and finally centralising pathology and genetics services onto a single site near the Southern Campus.

The process to transform acute hospital services across the city is well underway with the opening of the new West of Scotland Cancer Centre in 2007 and construction of two, state of the art, Ambulatory Care Hospitals (ACH) at the Victoria and Stobhill sites. The ACH's will be commissioned over the period late 2007 to summer 2009, which will result in not only significant modernisation of Glasgow's healthcare facilities and creation of single centres of excellence but will also result in 4 of Glasgow's major adult hospital sites operating below capacity.

This document describes the scheme which forms the second phase of the Acute Strategy, this involves the development of the new South Glasgow Hospital campus which not only sees the single biggest phase of modernisation and rationalisation of our adult clinical services, but incorporates the creation of a new Children's Hospital for the Greater Glasgow and West of Scotland populations and the completion of the modernisation of Glasgow's Maternity Services.

On completion of the development of the new adult hospital in 2014, the Board will be able to enact the following:

- inpatient services in the Victoria Infirmary to transfer to the new development thus vacating the Victoria Infirmary site;
- inpatient services at the Mansion House Unit (MHU) to transfer allowing closure of the MHU (Note that some of the beds will already have transferred in 2009 to the new Ambulatory Care Hospital);
- inpatient services housed in outdated buildings on the southern site to be relocated;
- transfer of Accident and Emergency services and associated beds at the Western Infirmary enabling closure of the Western Infirmary.

By 2014, following some major refurbishment and new build works within existing estate at Glasgow Royal Infirmary and Gartnavel General Hospital, sufficient capacity will be created, following the opening of the new South Glasgow Hospital, to allow the 3 site inpatient configuration of adult services to be implemented.

Phase 3 of the Acute Services Strategy sees the major redevelopment and modernisation of the Glasgow Royal Infirmary campus and this work will be developed with a view to being brought forward for funding consideration in the period beyond 2015 followed by the final phase, which would see the redevelopment and modernisation of the retained adult inpatient services required on the Gartnavel General Hospital campus undertaken.

## 1.4 PROPOSED FUTURE SERVICES

### 1.4.1 Adult and Children's Services

***Adult New Build***

A 1,109 bedded adult new build acute hospital is planned. This will provide A&E services and acute specialist in-patient care, a small volume of medical day cases and out-patient clinics serving the local population. No day surgery will be undertaken as this will be provided by the New Victoria Hospital.

***New Children's Hospital***

The proposed new 240 bedded children's hospital will provide A&E services and a comprehensive range of inpatient and day case specialist medical and surgical paediatric services on a local, regional and national basis. The new development will also have outpatient facilities. The Health Board's strategy is that all Glasgow's Children's Services (up to the age of 16 and up to 18 years where appropriate) will be provided at the New Children's Hospital.

The planned number of beds for the adult and children's hospitals are shown below:

| Adult Hospital | |
|---|---|
| ***Specialty*** | ***Beds*** |
| General Medicine (including MHDU) | 407 |
| Haematology | 14 |
| Dermatology | 18 |
| Nephrology (incl surgery) | 80 |
| Geriatric Medicine | 93 |
| CCU | 18 |
| ITU | 20 |
| SHDU | 23 |
| General Surgery & Vascular | 169 |
| Urology | 51 |
| Orthopaedic & Ortho Rehab | 141 |
| ENT | 37 |
| Clyde Beds * | 38 |
| Total In-patient Beds | 1,109 |

| Children's Hospital | |
|---|---|
| ***Specialty*** | ***Beds*** |
| In-patient (including critical care areas) | 193 |
| Short-stay (emergency receiving) | 20 |
| Day Care/Day Investigation | 27 |
| Total | 240 |

* Clyde Beds

In line with the South of the River Strategy for Clyde, consulted and agreed on during 2006/07, the in-patient bed requirements for the following services have been included within the bed model for the new South Glasgow Adult Hospital – Vascular Surgery, ENT, Dermatology and Haematology.

### 1.4.2 New Laboratory Build

The proposed New Laboratory build will provide biochemistry, haematology blood transfusion and mortuary services.

### 1.4.3 Retained Services

The Southern site will retain approximately 630 beds within the Institute of Neurological Services, Maternity, Spinal Injuries and Langlands buildings. The Langlands facility provides older people's services and also services for the young physically disabled.

### 1.4.4 Future Service Changes

At the time of undertaking the latest bed modelling exercise for the ASR it was recognised that there might be future changes to bed numbers as the result of changes to regional services provision such as neurosciences, oral-maxillofacial services, renal services, gynae-oncology services. With the exception of renal services, which has already been factored into the new South Glasgow Adult Hospital's bed model other potential changes to requirements in relation to beds do not affect the new South Glasgow Adult Hospital's current proposals.

## 1.5 EXPECTED BENEFITS OF THE PROJECT

It is anticipated that the proposals set out in this business case will deliver a range of benefits for patients. These are as follows:

- Provision of high quality services which are timely, accessible and consistently available by providing local access to core medical and surgical services and consolidating specialist and tertiary services on fewer sites within the city.
- Investment in high tech equipment and Information Technology
- Attention to design and landscaping to improve the patients overall care
- Fully accessible to all and DDA compliant (Disability Discrimination Act.)
- Reduced waiting times for treatment through the provision of more efficient services increasing clinical capacity by investment in Information Technology (IT), the concentration of clinical teams onto fewer sites, optimising departmental and functional relationships and improving access to diagnostic services such as laboratory services.
- Access to highly specialised services provided by skilled staff facilitated through the centralisation of services.
- Rapid, one stop services through high volume processing of diagnostic tests and an extended working day to fit in with new models of care.
- Protection of elective workload from disruption by emergencies thereby improving the efficiency of the service and reducing the number of cancellations.
- Enhanced staff skills and knowledge through improved retention and recruitment due to a radically better working environment
- Modern, fit for purpose facilities which meet the needs of patients, visitors and staff

- Enhanced University links through co-location of an academic centre with the new hospitals on the Southern General Campus. This will enhance teaching, and research and play a significant role in attracting and retaining high quality staff in all disciplines.

It is also recognised that the proposed new builds on the Southern site could contribute substantially to the local Govan economy and the wider area.

A social economic benefits analysis was carried out by SQW Consultants, funded by NHS Greater Glasgow NHS in partnership with a number of other contributors including Scottish Enterprise and Glasgow City Council.

The analysis looked at the potential impact on the immediate area around the Southern General site, the wider city of Glasgow and the Glasgow Metropolitan City Region. The analysis identified potential benefits within the following categories: economic, human and social, knowledge (e.g. research and development) and place.

In brief SQW has estimated that the future service configurations on the Southern General site will have a combined direct, indirect and induced economic impact of between £30 and £40 million on the South West Glasgow economy; between £110 and £140 million on the city economy and between £240 and £290 million on Glasgow city region by 2012/13. The new builds will also contribute to opportunities for training and employment and the development has the potential to support collaboration between academic, public and private sector partners to realise opportunities in research and development, bio-medical and life sciences.

In conclusion, the Southern General development is seen as a catalyst for wider social and regeneration activity contributing to the creation of higher aspirations for the physical development of the local area.

## 1.6 OPTION APPRAISAL – SITE AND DESIGN OF NEW SOUTH GLASGOW AND NEW CHILDREN'S HOSPITALS

### 1.6.1 Greenfield Option

For purposes of comparison for the Outline Business Case the option of building the new hospitals on a Greenfield site was revisited. This confirmed the outcome of the 2002 review, during which this option was first explored and dismissed because of high cost.

### 1.6.2 New Southern General Campus Options

Site

In thinking about the optimum site on the Southern General Campus for the New South Glasgow and New Children's Hospitals a key criterion has been the need to physically link the new hospitals to the Maternity and Neurosciences buildings. This will allow ready access to a range of paediatric services for foetus in utero or new born babies and mothers access to critical care and other acute services. An area which lies between the Maternity and Neurosciences buildings has therefore been designated for the construction of the new Hospital to allow these links.

Separate or Integrated Hospital Builds

In comparing options to build the new hospitals separately or together as an integrated build, the latter, an integrated build, was considered to offer more benefits, less risk, increased deliverability and lower cost. A further option appraisal took place involving NHS stakeholder input to identify the optimum design solution for the integrated build. An exemplar design was then developed involving input from a wide range of users.

Supporting/Associated Developments and Works

In addition to the new Adult and Children's Hospitals and Laboratory facility there are series of associated developments and works. For the purposes of the Outline Business case two options around the Southern General site have been developed, these are option 1 with a higher percentage of new build associated developments and option 1a utilising more of the existing estate.

### 1.6.3 Benefits Appraisal

A benefits appraisal exercise was undertaken looking at the Greenfield site, Option 1 and Option 1a. The benefits criteria were derived from the project objectives. The criteria were weighted and scored against each of the options. The appraisal of the options produced scores within a very tight band, those options involving an increased percentage of new build producing slightly higher scoring.

## 1.7 LABORATORY SERVICES

A Glasgow wide review of laboratory services identified centralisation of the majority of laboratory services on the Southern General site and Glasgow Royal site as the optimum configuration to support the Acute Services Strategy.

A new build laboratory facility is planned for the Southern General site housing haematology, biochemistry and mortuary services. The laboratory will be located alongside the new hospitals linked via an underground tunnel.

The new build will support the New Adult and Children's Hospitals and other services south of the city. The planned model for the new laboratory development will be one of high volume processing of tests with use of automation and up-to-date integrated IT systems with extended day and 24/7 working to reflect the new patient care models.

## 1.8 FINANCIAL ANALYSIS

The capital cost of the proposal to provide New Adult and Children's Hospitals on the Southern General site is forecast to be £841.7m (Option 1a, 100% single rooms).

It is proposed to fund this following a public capital procurement route, combining £270m of capital resources sourced from the Board's general allocation of capital funds and from capital receipts generated from the disposal of sites which become surplus, together with £20m from its endowment funds, leaving £551.7m to be provided by SGHD in the form of a specific allocation of capital funding to the Board. This represents the level of capital funding which the Board requires to deliver the proposal contained within this Outline Business Case, and which is the subject of the Outline Business Case.

The Board has tested alternative procurement routes for delivering the new Adult and Children's Hospitals, assessing each of these in terms of their capacity to deliver Value for Money and Affordability. The outcome of this assessment confirms that there is little to differentiate the alternative procurement routes in terms of their capacity to deliver Value for Money, however a publicly funded capital route offers the potential to deliver an affordable solution within the context of the Board's financial plan for the 10 year period to 2017/18.

In testing the affordability of a new service commitment of this scale, the Board has required to prepare a 10 year forward financial plan which examines the movements in both funding and expenditure which it is likely to face over this time period. In doing so, it has identified and assessed the key areas of risk which could impact on its financial projections, and reviewed its capacity for mitigating these through management action. On the basis of this analysis, the Board is able to conclude that the proposal which is contained within this OBC is affordable.

## 1.9 ASSOCIATED CAPITAL WORKS

As described, there are a series of smaller capital works and developments associated with the new hospitals, these being: clearance of the build site, development of multi-storey car parks, a clinical support facility and a 22 bedded rehabilitation facility.

The capital cost of these associated works is identified and will be funded from within the Board's Capital Allocation provided through separate business cases. Those projects above the Board's delegated authority will be subject to Capital Investment Group, Scottish Government approval.

It is proposed that all of the above projects and the new adult and children's hospital will be planned and co-ordinated through a Site Programme Co-ordinating Group, ensuring that all potential risks that may occur in delivering a multi-construction project environment are appropriately managed.

## 1.10 PLANNING PERMISSION

The Outline Planning Application was submitted to Glasgow City Council on 13th April 2007. The application was considered at the Glasgow Planning Committee meeting held on 16th January 2008 and received approval subject to specific conditions and the Section 75 legal agreements.

## 1.11 UNIVERSITY – WORKING WITH ACADEMIC PARTNERS

Glasgow University is intending to support the development of the Southern General campus by building an academic centre on the site. This will provide a modern academic facility to support teaching and research. An area of land on the Southern Campus has been identified by the Health Board for this purpose.

A new multidisciplinary Skills and Education Centre is also proposed. Partners in this include the Royal College of Physicians and Surgeons of Glasgow, the University of Glasgow and NHS Education for Scotland. A site adjacent to the new hospitals has been identified as a possible location.

## 1.12 FACILITIES, TECHNOLOGY, WORKFORCE

The reconfiguration of services across Glasgow will have a major impact upon the workforce and the requirements for information technology and facilities.

The Health Board's intention is to provide all hard and soft FM services from within NHS Greater Glasgow and Clyde's facilities pool and to explore the most effective methods of service delivery through benchmarking to achieve value for money and efficiency for these services. The FM services for the PFI Langlands Building in the south of the southern campus will remain with the present contractor and will not form part of this exercise.

There is a need to invest in significant Information Technology (IT) infrastructure with appropriate functionality to support the reconfiguration of services and emerging models of care, which will be crucial to the successful implementation of modern efficient healthcare systems.

As the largest NHS employer in Scotland, NHS Greater Glasgow and Clyde will continue to undertake effective workforce planning linked to issues of service delivery and redesign. This will allow any future workforce gaps to be identified as well as to set in motion a range of solution based action plans.

The proposal to develop the South Glasgow Hospital site will consolidate a range of services which will require the transfer of staff from a number of existing sites across the city. The opportunities for redesign offered by the new investment in facilities and the consolidation of workforce onto fewer sites will allow for significant re-profiling of the workforce.

In determining the potential workforce implications of change, workforce planning methodologies have been developed in conjunction with input from Service Directors and Professional Leads. This has involved analysing a range of policy and legislative drivers for change and a review of the subsequent knock-on effect for future workforce requirements.

## 1.13 REDESIGN OF SERVICES

Another important aspect in the success of the project will be a proactive programme of redesign of services to:

a) ensure efficient services which:

- meet patient needs;
- offer one-stop services;
- offer quick access to diagnostic services;
- reduce the amount of time patients are in hospital;
- provide a balance of care and treatment in the community.

b) provide a high quality streamlined service within the projected bed complement;

c) influence the optimal building layout and design.

An important aspect of the redesign work will be the interface with the Community Health (and Care) Partnerships to ensure, where appropriate, services for patients are provided outside of hospital settings.

A programme of redesign work is underway to address the models of care associated with the Ambulatory Care Hospitals. The programme is closely linked to the planned changes in regional workforce planning and the development and implementation of the information Management and Technology Strategy.

The methodology and templates being put into place to take this work forward will be applied to the New South Glasgow Hospital ensuring consistency in care models and a streamlined flow of service provision within Glasgow.

## 1.14 PROJECT MANAGEMENT ARRANGEMENTS

Robust Project Management arrangements are in place to ensure that the project, and the individual elements within it, meet the expected time, cost and quality criteria.

## 1.15 PARTNERSHIP WORKING

The Board is committed to partnership working. There is an open and inclusive approach to staff side communication and the Board. The project management arrangements incorporate partnership working and staff side input with staff side membership on the two key project groups Project Executive Group and the Acute Services Review Programme Board.

## 1.16 COMMUNITY ENGAGEMENT

NHS Greater Glasgow and Clyde established a Community Engagement team in 2002 to inform and involve patients and the public in the acute services strategy. Dedicated staff have been allocated to the new hospitals and an extensive programme of consultation with patients, carers, families is ongoing. Detailed work involving communities in Greater Govan and South West of Glasgow is also occurring. The team are working in partnership with both local and national

organisations, such as Scottish Enterprise, to develop the full potential of the project for regenerating the wider area.

## 1.17 GATEWAY REVIEW

The New South Glasgow Hospitals project is subject to an Office of Government and Commerce (OGC) Gateway Review.

The review is an independent assessment confirming that the business case is robust to meet the business need, is affordable, achievable with appropriate options explored and likely to achieve value for money.

In doing this, the review outcome highlights whether aspects of the project are red, amber or green (traffic light system). Red means that the project cannot proceed to the next milestone until the issues identified as red are addressed. Amber means that the recommendations identified must be completed before the next Gateway Review stage. Green means that the programme or project is in good shape but may benefit from uptake of any green recommendations to enhance the project.

The project completed a Gateway Review Stage 1 assessment in January 2008. The outcome of the Gateway Review was that there were no red recommendations hence the project may proceed to the Board and Scottish Capital Investment Group with the Outline Business Case.

There were five amber and one green recommendations and these will be addressed before the Gateway 2 Review.

## 1.18 TIMETABLE

A summary of the indicative timetable for the project is shown below:-

| **Description** | **Target Date** |
|---|---|
| Outline Planning Approval | January 2008 |
| Gateway Review | January 2008 |
| Final OBC to NHS Greater Glasgow & Clyde Board | 19th February 2008 |
| Final OBC considered at Scottish Government Capital Investment Group | 26th February 2008 |
| Submit OBC to Cabinet | March 2008 |
| Final OBC Approval | April 2008 |
| Full Business Case Submission | 2nd quarter 2010 |
| Construction Starts | 2nd quarter 2010 |
| Completion – Children's Hospital | 1st quarter 2013 |
| Completion – Acute Hospital | 2nd quarter 2014 |

# 2. PURPOSE AND LAYOUT OF THE OUTLINE BUSINESS CASE

## 2.1 PURPOSE

The purpose of this Business Case is to present proposals for the development of an integrated children's and adult hospital and a laboratory build on the Southern General site.

The overall capital cost of the project is £841.7m (based upon mid point build costs); the anticipated timescale for completion of the development is the 2nd quarter 2014 with transfer of services thereafter.

This project has developed over a period of time and the following describes some of the background to enable an understanding of the history behind the component parts of the project.

### 2.1.1 New Adult Hospital

Over the last 10 years Greater Glasgow Health Board, now NHS Greater Glasgow and Clyde, has been developing an acute and related services strategy to modernise the acute adult health service in Glasgow. The proposals were agreed by the then Health Minister, Malcolm Chisholm, in 2002. The Acute Strategy is composed of four distinct phases.

The new adult hospital constitutes the second phase of the Acute Services Review. The main goal of the Acute Services Review is to address the mounting pressures to change the way in which services are delivered by reducing the number of acute sites across Glasgow and investing in fit for purpose facilities. In more detail the New South Glasgow Hospital development is the major part of the plans to reconfigure services by reducing the adult inpatient sites from the current six hospital sites to three, by the time the new hospital opens in 2014. Two sites, Glasgow Royal and the Southern General, will have A&E and trauma facilities. The third inpatient hospital will be Gartnavel General. These acute sites will be supported by the two new build Ambulatory Care Hospitals.

### 2.1.2 New Children's Hospital

The proposal contained within this business case is for a new children's hospital on the Southern General site which will allow transfer of the current Yorkhill children's services, thus achieving the gold standard of triple co-location as highlighted in Professor Calder's Report (2006).

Hospital services for children in Glasgow are provided by the Royal Hospital for Sick Children, which is sited at Yorkhill and co-located to the Queen Mother's (Maternity) Hospital. The Queen Mother's Hospital is one of three maternity hospitals in Glasgow, the others being located at the Southern General and Glasgow Royal sites. Following a review over a number of years the Health Board is reducing the number of maternity hospitals to two. The Queen Mother's Hospital will close and its services re-locate into a £28m extension and refurbishment at the maternity hospital on the Southern General site and the recently built maternity unit at Glasgow Royal Infirmary.

The transfer of maternity services from the Queen Mother's site will leave the children's hospital isolated. The recognised gold standard is to achieve triple co-location of children services, maternity and adult acute services. This allows safe obstetric care for mothers and preserves the links between maternal and specialist children's services, so that a full range of paediatric back-up and advice is available for both the foetus in utero and a new born child with significant and sometimes life threatening problems. Triple co-location also offers the advantage of strengthening links between paediatric and adult services, facilitating a continuum of care for those young people with long-term conditions.

### 2.1.3 The Laboratory Build

At present there are laboratory services on each acute site. As part of the Acute Strategy a review of laboratory services across Glasgow was undertaken to explore how the service might best support the future reconfigured clinical services, taking into account the clinical linkages between the laboratory specialties and the services needed to support the clinical service profile on each site.

The preferred option is to centralise the majority of laboratory services onto two main sites the Southern General site and the Glasgow Royal site. The designated area available for a new labs build on the Southern site is in close proximity to the proposed build for the new hospitals and therefore will allow a physical link to be formed between the laboratory and the hospitals.

### 2.1.4 Site Available on the Southern Campus

There are 2 key issues in considering the location for the adult and children's hospital, and laboratory facility on the southern site, these are as follows:

- First the requirement to achieve critical clinical adjacencies, linking the new adult and children's hospital to both the existing neurosciences and maternity buildings which sit at opposite ends of the site and,

- Secondly, the existing hospital services must be maintained during the construction of the new developments.

To meet the above criteria the adult, children's and lab new builds must be clustered close together in a partially vacant area of the site situated between the Maternity building and the Neurosciences Institute.

It is planned to construct the children's and adult hospitals as a single building, (*albeit with distinctive and different external and internal identities reinforced by separate approach and entrance areas*), in order to benefit from the clinical co-locations and support services synergies offered by an integrated build.

The new labs build will be under construction prior to the new adult and children's build within the same area of land.

In addition there are a number of capital works associated with the new hospitals, such as multi-storey car parks and a clinical services facility.

## 2.2 LAYOUT OF THE DOCUMENT

The structure and content of this business case is summarised in the table below.

**Outline Business Case – Structure and Content**

- Section 3 provides a profile of NHS Greater Glasgow and Clyde and summarises its activity, performance and financial status.
- Section 4 describes the case for change for the children's hospital, the options considered, current service, a description of the future requirements and project objectives.
- Section 5 details the case for change for the adult hospital, current service and demand for future services and project objectives and benefits.
- Section 6 describes the site and design configuration options for the new Adult and Children's Hospitals, design considerations and benefits appraisal.
- Section 7 gives a short summary of the laboratory proposal, the options and results of the risk and non-financial appraisals.
- Section 8 outlines the risk management strategy.
- Section 9 details the financial appraisal.
- Section 10 explores the procurement model for the scheme.
- Sections 11, 12 and 13 profile the Workforce Issues, Facilities Management and Information Technology Strategy.
- Section 14 describes the Campus Plan, Phasing of works, transport and opportunities for the wider environment.
- Sections 15 to 20 detail the Project Management arrangements to manage stage one and two of the project, the role of advisors, stakeholder involvement, action to address health inequalities, the wider social economic impact of the project and the results of the Gateway Review,
- Section 21 outlines the Benefits Realisation Plan.
- Section 22, gives the plans for post project evaluation.
- Section 23 shows the Outline Timetable for the scheme.

## 2.3 FURTHER INFORMATION

Any queries, comments or requests for further information in relation to this Outline Business Case should be addressed to:

Tel: [redacted]

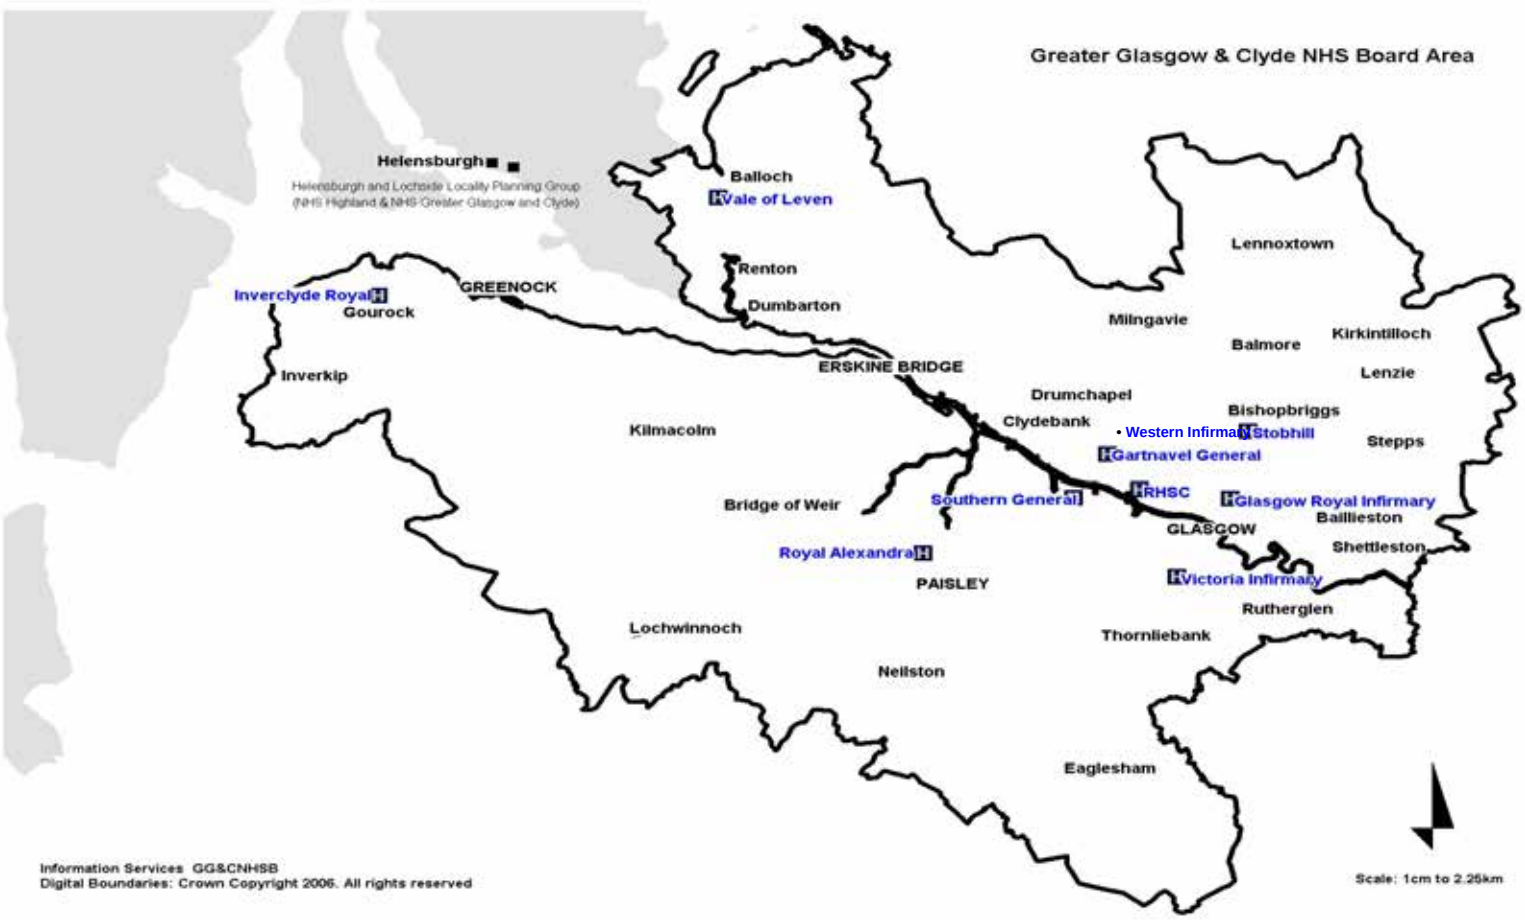
# 3. BACKGROUND AND STRATEGIC CONTEXT

## 3.1 OVERVIEW OF NHS GREATER GLASGOW & CLYDE

NHS Greater Glasgow and Clyde (NHS GG&C), formed in April 2006, is Scotland's newest and largest Health Board. The Board has 40,000 staff serving a total population of 1.2million people, with a budget of £2.2billion. The new Health Board joins the Clyde region of the former Argyll & Clyde Health Board with the former Greater Glasgow, to create NHS Greater Glasgow and Clyde. Acute services are delivered from 10 hospitals, 3 of which lie within Clyde and the remaining 7 are located within Glasgow city. The geographical area covered includes West Dunbartonshire, Inverclyde, Renfrewshire, East Renfrewshire, East Dunbartonshire, Glasgow City, South Lanarkshire (Rutherglen & Cambuslang) and North Glasgow (Stepps-Moodiesburn corridor).

Within Glasgow, the Western and Gartnavel General Hospitals operate in tandem delivering acute care in the west-end of the city. In the north-east of the city acute care is delivered from Stobhill Hospital and Glasgow Royal Infirmary. The Victoria Infirmary serves the south-east and the Southern General Hospital the south-west of the city. Services for children are provided centrally from the Royal Hospital for Sick Children, Yorkhill. Full adult Accident and Emergency services are provided at the Western Infirmary, Glasgow Royal Infirmary, the Victoria Infirmary and the Southern General Hospital. Stobhill Hospital has a Casualty Department which is covered by Consultant staff from Glasgow Royal Infirmary and the Western.

The location of these acute hospitals can be seen the in diagram below.



## 3.2 ORGANISATIONAL STRUCTURE

The Health Board is comprised of an Acute Division, a Mental Health Partnership, 10 CHCPs/CHPs including some joint CHP's with Lanarkshire and a number of Corporate functions. The Acute Division brings together all acute services across the city and Clyde under a single management structure led by the Chief Operating Officer. The Division is made up of eight Directorates of clinical services each managed by a director and clinical management team along with a Facilities Directorate. These are:

- Emergency Care and Medical Services
- Surgery and Anaesthetics
- Rehabilitation
- Regional Services
- Facilities
- Women's and Children's Services
- Oral Health
- Diagnostics
- Clyde

## 3.3 RESPONSIBILITIES OF NHS GREATER GLASGOW AND CLYDE

The NHS Board is responsible for strategic planning and investment in healthcare services to ensure that they meet the needs of the local population and that national targets and directives are implemented.

NHS Greater Glasgow and Clyde's core purposes are to assess the state of health of the people of Greater Glasgow and Clyde and plan and provide services which:

- Promote good health
- Prevent ill-health
- Improve health
- Provide safe and sustainable and equitable treatment for patients.

In doing this, the Board works in close partnership with other NHS organisations, local authorities and other agencies to ensure that social work, education, housing, employment and environmental services unite effectively and efficiently with the NHS in tackling inequalities and underlying health problems in local communities.

## 3.4 SERVICES AND ACTIVITY

The Acute Division of NHS Greater Glasgow and Clyde provides a comprehensive range of services from community based care (midwives, dental services and various outreach services) in addition to the full range of general hospital services. The organisation also hosts some of the most specialised health services in the country, including: cardiothoracic services, the Beatson Oncology Centre, the new West of Scotland Cancer Care Centre, the Institute of Neurological Sciences, transplant services, world-class paediatrics and obstetrics. A summary of services provided and activity undertaken is given in Appendices 1 and 2.

The breakdown of patient activity seen within Glasgow Acute Hospitals by Health Board in 2005/06 is shown in table 1 below.

Table 1

2006/07 Patient Activity seen within Greater Glasgow & Clyde Acute Hospitals (by Health Board)

| Health Board | Activity Inpatient | Episodes | Day Case Episodes | | New Outpatient Episodes | |
|---|---|---|---|---|---|---|
| Greater Glasgow & Clyde | **Actual** 211,731 | **%** 84% | **Actual** 107,276 | **%** 82% | **Actual** 288,230 | **%** 87% |
| Lanarkshire | 12,975 | 5.2% | 10,282 | 8% | 16,773 | 5% |
| Highland | 11,247 | 4.5% | 5,732 | 4% | 11,929 | 4% |
| Ayrshire & Arran | 7,044 | 3% | 4,283 | 3% | 8,075 | 2% |
| Forth Valley | 3,531 | 1.3% | 2,909 | 2% | 3,570 | 1% |
| Dumfries & Galloway | 1,255 | 0.5% | 301 | 0.2% | 876 | - |
| Others remaining Scottish | 3,041 | 1% | 644 | 0.5% | 1,821 | 1% |
| Others | 1,204 | 0.5% | 73 | 0.1% | 301 | - |
| Total | 252028 | 100% | 131500 | 100% | 331,575 | 100% |

It can be seen that over 80% of the workload is attributable to NHS Greater Glasgow & Clyde.

Lanarkshire and Highland account for approximately 5% and 4%of inpatient activity respectively.

Table 2 below details the overall activity trends over the last 5 years from 2001/02 to 2006/07. It can be seen that overall in-patient activity has increased by 4.9%, day cases by 14% and out-patients by 14%.

It should be noted that New South Glasgow Hospital will not undertake day case activity and will provide a local out-patient service. The growth in out-patient attendances within the south of Glasgow over the last 5 years (2002/3 to 2006/7) is 11.5%.

Table 2

Activity Trends within Glasgow Acute Hospitals over the last five years for in-patient episodes, day cases and new out-patient attendances

| | 2001/02 | 2002/03 | 2003/04 | 2004/05 | 2005/06 | 2006/07 | Percentage Increase in activity between 2001/02 and 2006/07 |
|---|---|---|---|---|---|---|---|
| In-Patient Activity | 224,972 | 221,457 | 227,127 | 228,674 | 227,453 | 235,918 | +4.9% |
| Day Cases Activity | 108,233 | 106,597 | 110,747 | 116,108 | 121,065 | 123,309 | +14% |
| New Out-Patient Activity | 271,213 | 275,542 | 270,870 | 280,116 | 296,936 | 309,302 | +14% |

## 3.5 FINANCIAL PERFORMANCE

NHS Greater Glasgow & Clyde (NHSGG&C) has an established record of sound financial management and has consistently achieved its targets. The Board's financial plan forecasts that total expenditure will be contained within its overall funding envelope thereby enabling it to secure achievement of its revenue financial target by managing within its "revenue resource limit" (RRL).

The financial plan incorporates provisions for the latest forecast of additional funding required to support implementation of the Acute Services Review (e.g. Beatson Cancer Centre, and Stobhill and Victoria new hospitals).

The baseline assumption is that the new South Glasgow and new Children's Hospitals and new Laboratory facility will be revenue neutral.

## 3.6 DEMOGRAPHY

### *3.6.1 Current population*

The combined mid-year estimated population of the NHS Greater Glasgow and Clyde area as of 30 June 2005, provided by the General Registrar Office for Scotland (GROS) and based on the 2001 Census, was 1,190,939. The equivalent population for Scotland was 5,094,800.

### *3.6.2 Projected population*

The Scottish population is expected by the GROS to stay around the 5 million mark for the next 18 years, only slightly increasing to 5.1m by 2019 until a decrease is forecasted for after 2036. The Scottish population will become considerably older as a result of decreasing birth rates and the aging of those born during the 'baby boom' (mid 1960s). There will be a shift of the population, both within Scotland, and between Scotland and the rest of the UK and the world. Specifically, significant numbers are expected to migrate from Glasgow City, and most West of Scotland council areas. Counteracting this reduction is the fact that, increasingly, people are immigrating to Scotland most recently from European Union accession states. This inward migration is serving to offset the broadly declining birth rate and the fact that deaths have exceeded births since 1996.

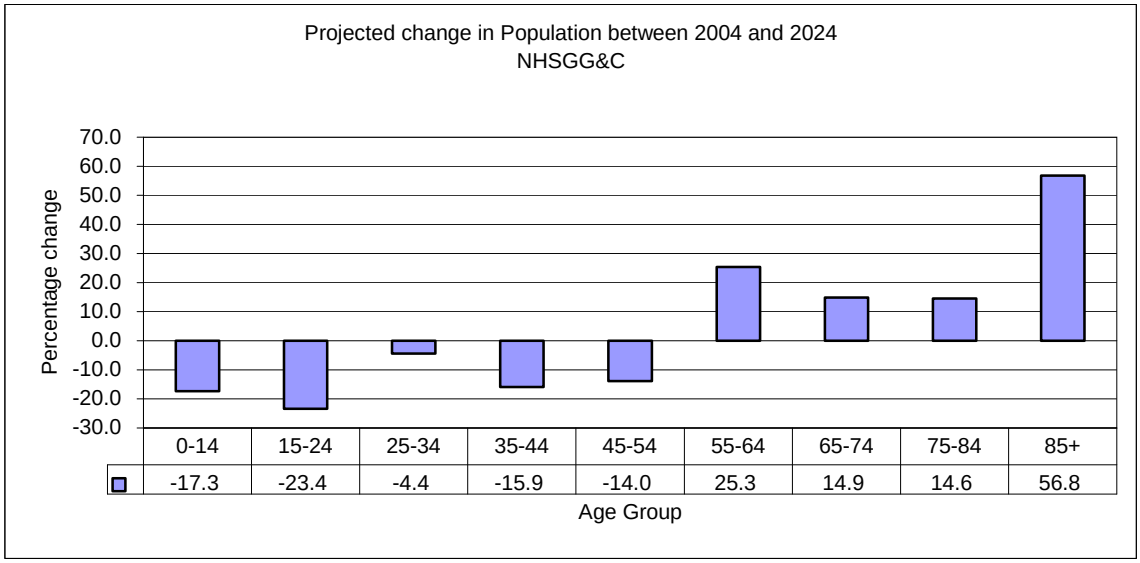
The NHSGG&C population is expected to reduce overall by 5.5% by 2024, although this reduction will be particularly marked for specific age groups with implications for the planning of new hospitals in Glasgow. For example, it is expected that there will be fewer children aged 0-14 years in the GG&C area by 2024. On the other hand, there will be considerably more in the older age groups with implications for the planning of the new hospitals (Table 3).

This so-called 'demographic shift' (ageing of the population), that has been occurring for the past 30 years since deaths exceeded births for the first time in 1976, is more extreme in GG&C than in Scotland as a whole and will continue for the next few decades (Figure 1). The octogenarians will be particularly numerous in Greater Glasgow and Clyde by 2024, having experienced a 57% rise over 2004 figures.

Table 3

The projected change in population in NHS Greater Glasgow and Clyde between 2004 and 2024.

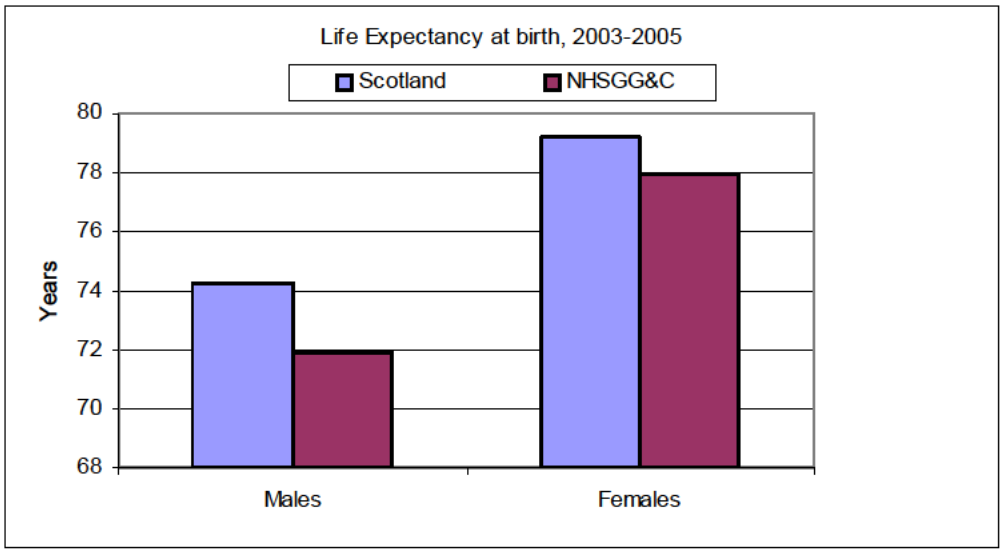
*(Data shown is based on the GRO 2004 – based population predictions (published in 2005)*



*Life expectancy*

Life expectancy at birth is increasing throughout the world at around 4 months per year on average as a result of improving life conditions and medical advances. Average life expectancy at birth is greater for women than for men generally. It is greater, for both genders, in all other NHS Boards in Scotland than in NHSGG&C, confirming that the population of Greater Glasgow and Clyde remains the most socially deprived in Scotland and enjoying the shortest life expectancy as a result.

**Figure 2**



Life Expectancy at birth (years) for residents of NHSGG&C and for residents of Scotland between 2003 and 2005.

## 3.7 HEALTH STATUS AND HEALTH IMPROVEMENT

Chronic disease remains a significant problem with almost 42% of the population reported being treated for more than one health condition, with people in deprived areas (Social Inclusion Partnership, SIP status is used as a proxy for most Deprived postcode areas) slightly more likely to be receiving treatment than residents of less deprived areas (non SIP). The gap between SIP and non-SIP areas is however starting to close. The percentage of people receiving treatment for one or more condition(s) increases with age, see Table 4 below.

Table 4: Percentage of people who received treatment for one or more condition(s) by age group

| Age Group | Percentage |
|---|---|
| 16-44 | 22.3 |
| 45-64 | 54.5 |
| 65+ | 81.0 |

Just over three quarters of residents (78%) reported visiting their GP in the last year. Older people, women, those in more deprived areas, those in poor physical health, those in poor mental health, those who are obese and those who are physically inactive tended to make more frequent use of their GPs.

The proportion of respondents that reported visiting an out patient department has reduced, (30.7% visited an outpatients in 1999, this reduced to 24.6% in 2002 and 22.9% in 2005), but attendance at Accident and Emergency looks different, where significant increases had occurred in the proportion of respondents living in SIP areas that visit A&E, as illustrated in Table 5:

| Table 5: The percentage of respondents who had visited Accident and Emergency in the last year | | | |
|---|---|---|---|
| | Total Sample (%) | SIP (%) (Deprived Areas) | Non SIP (%) (Non deprived areas) |
| 1999 | 14.2 | 11.9 | 15.1 |
| 2002 | 14.9 | 17.0 | 14.1 |
| 2005 | 14.5 | 17.1 | 13.5 |
| Change 1999-2005 | N/A | 5.2 | N/A |
| P | N/A | <0.05 | N/A |
| Confidence Interval | N/A | 0.8-9.6 | N/A |

NHSGGC has established strong partnerships to deliver further Health Improvement within the population in the form of integrated Community Health (Care) Partnerships and Community Planning Partnerships and identified resources to maximize the contribution of acute and mental health services to health improvement.

The aims of NHSGGC and partners including, Local Authorities, Police, Economic Development Agencies and Voluntary Organisations, are to reduce inequalities, improve life circumstances and support improved lifestyles. Let Glasgow Flourish (2006) describes the complex nature and inter relationship between risk factors and health outcome recognising that there is a 'Glasgow effect' that is, an excess of mortality beyond that which can be explained by current indexes of deprivation. The result being that Glasgow's health status remains worse than that of comparable English cities like Liverpool.

The significant Public Health challenges with Glasgow, highlighted by the Director for Public Health Report 2007 include:

- Health Inequalities
- Obesity
- Alcohol misuse

### 3.7.1 Health Inequalities

Much of Glasgow has now become a more affluent and 'middle class' city with a profile that is currently similar to most UK cities. Yet, Glasgow's overall health status does not fully reflect these changes.

### 3.7.2 Mortality and Morbidity

Trends in overall deaths are downward, but the mortality gap between the communities with the highest and lowest mortality has widened noticeably. When the West of Scotland councils are compared there is and eight year gap in male life expectancy with Glasgow having the lowest life expectancy (69.1) and East Dunbartonshire (77.2) the highest.

Even within Greater Glasgow there are differences in life expectancy, for instance, there is an estimated 15 year gap in male life expectancy between Bridgeton & Dennistoun and Anniesland, Bearsden & Milngavie.

Among West of Scotland councils, Glasgow City has one of the lowest proportions of children in its population but the highest proportion of working age.

In Glasgow the proportions of men and woman of pensionable ages are strikingly different – 22% of women compared to 12% of men.

It is notable how relatively young people are when they are first affected by limiting long standing illness, as is the length of time people, particularly women, live with a limiting long-term illness.

Despite overall reductions in mortality, huge health inequalities remain and indeed such inequalities appear on the basis of a number of different mortality and life expectancy measures, to have widened over the last 10 to 20 years.

### 3.7.3 Education

Glasgow City has by far the highest proportion of pupils from minority ethnic communities of any Scottish Local Authority (10.9%), equating to 7,500 pupils. It also has the highest percentage of pupils from less affluent households – 42% of primary school pupils were eligible to receive free school meals in 2004, double the nation's average.

### 3.7.4 Social Environment

Homelessness applications in Glasgow have been consistently double the Scottish average for the last eight years and are much higher proportionally than in the other West of Scotland council areas.

Glasgow City has the highest overall crime rate among councils in Scotland and within the West of Scotland, Glasgow has the highest rates for a range of crime types.

Analysis of violent crime in Glasgow shows that male offenders outnumber females by over three to one and the peak of ages for the offenders and victims are mid-teenage years to early twenties. The areas of residence of violent offenders and victims of violence are highly correlated with deprivation. In some smaller communities in Glasgow over one in ten people have been the victim of a violent crime in the last three years.

### 3.7.5 Economy / Employment / Income

In terms of business, it is clear that Glasgow has retained a position within the UK as a major business centre, and is rated second only to London as a retail centre. However, Glasgow's ranking in terms of economic output has fallen relative to other UK cities in recent years.

There are now more women then men in employment in Glasgow and part-time work has grown to represent more than a quarter of all jobs. The number of Glasgow residents in employment has grown in the recent years (by more than 45,000 jobs in the period 1998-2004) but employment levels remain considerably lower than the Scottish average, although the gap has reduced.

The official unemployment rate and the claimant unemployment rate have both reduced greatly over the last four to five years. Relative inequalities in employment between different parts of the West of Scotland, and within Glasgow, remain however, and official unemployment rates do not provide a true measure of the extent of worklessness. In Glasgow it is estimated that there are 110,000 adults who are not economically active, equating to 30% of the working age population.

The Board is committed to tackling health inequalities and has created a framework around which action plans for CH(c)P's/CHP's, the Acute Operating Division and the Mental Health Partnership are being developed. This is detailed in the NHS Greater Glasgow & Clyde Planning and Priorities Guidance 2007-2010 and the Board's Single Equality Scheme 2007.

## 3.8 WORKFORCE

**Staffing**

The workforce profile and workforce issues are described in detail in Section 11.

Approximately 40,000 staff members are employed by the NHS Greater Glasgow & Clyde. In addition to these, there are University and voluntary staff who also contribute to NHS Greater Glasgow's output. The current whole time equivalent by discipline is shown in table 6 below.

Table 6: Showing NHS Greater Glasgow & Clyde Headcount Figures

| Categories | NHSGG&C Acute |
|---|---|
| Medical (inc GP's)<br><br>Dentist | 4,154<br><br>765 |
| Nursing and Midwifery | 17,423 |
| Therapeutic | 3,253 |
| Healthcare Science and Technical staff | 2,408 |
| Pharmacy | 708 |
| Administration/Clerical and Senior Management | 7,083 |
| Estates, Works and Ancillary | 4,456 |
| **Total** | **40,250** |

## 3.9 UNIVERSITY LINKS – WORKING WITH ACADEMIC PARTNERS

The University of Glasgow Medical School is one of the two largest in Scotland.

NHS Greater Glasgow & Clyde has a long-standing and close working relationship with the University of Glasgow and other Glasgow Universities which manifests itself in a number of ways:

- Academic staff working within the NHS to provide direct clinical services
- Shared posts, particularly in laboratory specialties
- Teaching of undergraduate and postgraduate medical students
- Teaching of science students
- Collaborative research projects between NHS and academic staff which have a significant impact on the local and national economy.

Once developed the new Southern site will be one of the largest clinical campuses in the UK in terms of the range and volume of clinical activity and the accompanying staff profile. As well as creating major opportunities and responsibilities in regard to training and education the pattern of co-located services will facilitate collaborative and innovative research activities across the spectrum of maternal, child and adult health and disease.
Against that background there is a clear recognition by NHS Greater Glasgow and Clyde, the University of Glasgow and the other Universities and educational partners with whom the Health Board engages, that the site will require to sustain, and be supported by, an active programme of on-site education and research.

Planning is already underway with key academic partners for the provision of academic, training and educational facilities on, or near, the new Southern site. These facilities will support clinical research programmes, ensure a modern educational environment for undergraduate teaching across the clinical disciplines and provide clinical skills and associated accommodation to facilitate the professional development of all staff groups.

In addition to enabling the development of existing staff, the creation of high quality academic and educational facilities on and around the site will significantly enhance the ability to recruit and retain the numbers and quality of staff required to maintain excellence in clinical service provision.

# 4. THE NEW CHILDREN'S HOSPITAL DEVELOPMENT

This section describes the following aspects of the Children's Scheme:

- The case for change and the future strategy for delivery of services,
- options considered,
- the current service and a description of the future service requirements,
- Project Objectives, in other words, the benefits the scheme is required to provide.

## 4.1 CASE FOR CHANGE AND FUTURE STRATEGY

Children's hospital services are currently provided by the existing Royal Hospital for Sick Children (RHSC) which is sited at Yorkhill and co-located with the Queen Mother's (Maternity) Hospital (QMH) and the Regional Medical Genetics Services. Apart from these services no other adult medical services are provided on the site.

The main block of the current hospital was built in 1970 with a number of amendments and additional facilities added in the intervening years. A full description of the services provided by the RHSC is incorporated in the next section but the hospital is the largest children's hospital in Scotland and provides a comprehensive range of secondary and tertiary care which is accessed locally, regionally and nationally.

The adjacent QMH was opened in 1964 and part of the rationale for its location on the Yorkhill site was the perceived clinical benefits associated with co-location of children's and maternity services. Over the intervening years the advances in the diagnostic and care options available for both the foetus in utero and a new born child with significant, and sometimes life threatening, problems have increased enormously. In response to these advances the ability to manage a pregnancy in which there is concern for foetal well-being in a setting that provides a full range of paediatric back-up and advice allows the provision of a "gold standard" of care. This becomes particularly pertinent at the time of birth when the capacity to provide full obstetric care to the mother, and equally, to offer seamless and comprehensive care to the new born child without the need for transfer or separation, ensures the highest quality and safest pattern of care for both.

The availability of this pattern of care on the existing Yorkhill site currently results in mothers from all parts of Scotland, known pre-natally to be carrying a child with a significant foetal abnormality requiring early intervention, being transferred to Yorkhill for their obstetric management at the time of birth.

Against that background issues relating to the overall provision of maternity services across Glasgow, combined with concerns regarding the separation of the QMH from other adult services supportive of maternal care, raised questions about the long-term maintenance of the maternity service on the Yorkhill site.

The QMH is currently one of three maternity units within Greater Glasgow, the others being located at the Southern General Hospital (SGH) and the Glasgow Royal Infirmary (the Princess Royal Maternity Hospital)(PRMH). In 2006/07 these three units provide care for a total of 11,910 births (QMH 3,326, SGH 3,092, PRMH 5,492).

The overall fall in the birth rate in recent years, combined with workforce drivers particularly regarding the sustainability of senior and junior medical staffing complements and rota arrangements required the Health Board to consider reducing the maternity units within the city from three to two. That concept was initially accepted by the Health Board's Maternity Services Strategy in 1999 and in 2003 a process was initiated to determine the future configuration of maternity services within the city.

The ensuing professional and public debate was shaped by the twin aspirations of ensuring that mothers, particularly during labour, had ready access to intensive care support and that the foetus at risk received the pattern of integrated and timely care which can only be achieved by the co-location of maternal and paediatric facilities.

Following completion of a consultation exercise the then Greater Glasgow NHS Board, at its meeting in April 2004, agreed a recommendation that a reduction in maternity units be effected by the closure of the QMH. The Minister for Health and Community Care, in September 2004, acknowledged the concerns expressed regarding the consequent loss of the links between maternal and specialist paediatric services afforded by the existing hospital configuration on the Yorkhill site. By way of response the Minister announced that the Scottish Government would provide £100 million to enable a new children's hospital to be built on a site which would support the "triple co-location of services", thereby ensuring safe obstetric care for mothers and the preservation of the links between maternal and specialist children's services, as well as offering the option of strengthened clinical links between paediatric and adult services.

In that latter regard adolescent services and facilities have long been recognised as one of the weakest areas of NHS provision across the UK. Commonly teenagers and young adult patients have to be accommodated within hospital services targeted primarily either at younger children or older adults, neither of which arrangements are suitable for the social, developmental or clinical requirements of this age group. The move of the RHSC to an acute site, implemented in conjunction with the Scotland-wide shift of the upper age limits for children's hospitals from 13th to 16th birthday (and up to 18 where appropriate) will allow the provision of facilities specifically designed for this age group.

In addition the co-location of children's and adult services will support a collaboration between paediatric and adult specialties that will facilitate a continuum of care for those young people with long-term conditions for whom the transition from paediatric to adult services is often a very unsettling and clinically disruptive period.

## 4.2 DESCRIPTION OF OPTIONS CONSIDERED

The main criteria in considering options for the location of the New Children's Hospital were the capacity to address the requirement for "triple co-location" of paediatric maternity and adult services (as identified as the gold service standard by Professor Calder's Report) and the availability of land.

The options considered for the future of children's services were either :-

- 'Do nothing' – in other words leave the children's services on the current site

or

- A new build on an acute site.
-

For the reasons already described the 'do nothing' option was dismissed on the clinical grounds that it would leave the children's services on an isolated site and would not provide the triple co-location required to maximise high quality, safe care.

An additional reason for dismissing the 'do nothing' option was the high cost of refurbishing the current Yorkhill buildings from which children's services are provided.

The preferred option is therefore a new build within an acute site.

The Minister established a Clinical Advisory Group chaired by Professor Andrew Calder with the remit to work with NHS Greater Glasgow to identify the most appropriate site for the new children's hospital through a process of service planning, stakeholder engagement and public consultation.

(GRO – Using General Register Office 2004 based Population Predictions)

An option appraisal exercise considering all of the potential available hospital sites within the Glasgow area took place in October 2005. The Southern General site was identified as the only site which fulfilled the two aforementioned criteria, that of having available land and offering triple co-location of paediatric, maternity and adult services.

In addition, as paediatric neurosurgery is already located on the Southern site, this option also offers a range of additional clinical services which will enhance patient care.

Many children requiring neurosurgical care will also experience other clinical problems which require the advice or input of a range of paediatric specialities and support services. Currently the provision of such support requires either the transfer of the patient or the movement of staff between Yorkhill and the Southern General site. The ability to offer neurosurgical care in the context of a full complement of paediatric medical, surgical and intensive care expertise will substantially facilitate the provision of high quality, safe and comprehensive care to this patient group.

In parallel with the above, and consequent upon the Ministerial announcement in 2004, the decision to build the new children's hospital in Glasgow was recognised in Delivering for Health (2005), the Scottish Government response to the Kerr Report, as being an integral part of the future plans for the delivery of specialist paediatric services in Scotland.

*"We have already agreed funding to relocate the Royal Hospital for Sick Children in Glasgow as a centre for national expertise in specialist children's services. It will be co-located with maternity and adult services providing a 'gold' standard children's hospital"* Malcolm Chisholm 2004

Following publication of Professor Calder's Report published in March 2006, a public consultation process on the future site of the new children's hospital was initiated in April 2006, the outcome of which endorsed the proposal to adopt the Southern General as the site for the new hospital. The proposal was ratified at a Greater Glasgow and Clyde Health Board meeting on 27th June 2006.

Confirmation was also provided by the Scottish Health Council in August 2006 that the consultation process had demonstrated compliance with the relevant guidance for such procedures.

Concurrent work is being undertaken in NHS Lothian regarding the reprovision of their children's hospital facilities, which are currently delivered from a site which does not include maternity or adult hospital services. This project, which has already obtained Initial Agreement from the Scottish Government, also shares the goal of delivering services from a site offering triple co-location.

Clinical and managerial staff involved in the initial planning for the proposed new children's hospitals in both Edinburgh and Glasgow recognise the need for these two projects to be taken forward in a collaborative manner that enhances the overall provision of specialist paediatric services within Scotland. To that end formal links have already been established between the two projects and there is also close interaction with the National Steering Group for Specialist Children's Services, chaired by Malcolm Wright, which has a remit to develop a national delivery plan for specialist paediatric services within Scotland.

## 4.3 DESCRIPTION OF THE CURRENT SERVICE AND FUTURE REQUIREMENTS

The RHSC (Glasgow) is Scotland's largest children's hospital and provides a comprehensive range of specialist care on a local, regional and national basis. Annual activity for 2006-2007 comprised

| | |
|---|---|
| Out-patient attendances: | 72,791 (New: 20,307; Return: 52,484) |
| In-patient admissions | 15,806 (Emergency 54%) |

| | |
|---|---|
| Day Cases | 8,195 |
| A&E Attendances | 38,588 |
| Surgical procedures | 11,636 |

Within Greater Glasgow essentially all in-patient care for children up to their 13th birthday (with the exception of paediatric neuro-surgery as previously mentioned) is provided by RHSC. This includes a full range of secondary medical and surgical paediatric services.

Accident and Emergency services for children aged 12 and under continue to be provided at all the city's current A&E Departments (excluding the Western Infirmary) although most ambulance transfers are brought straight to RHSC. Following earlier discussions within NHS Greater Glasgow agreement was reached that paediatric Accident and Emergency activity should be centralised in the children's hospital. These plans, taken in conjunction with the planned change in age limits for children's hospitals (see below) will involve a significant increase in the number of A&E attendances which will be incorporated into the planning of the new hospital. The parallel development of Minor Injury Units at several sites across Glasgow is designed to ensure that less severe problems can be dealt with nearer to home

The majority of paediatric outpatient activity is also dealt with at RHSC although some work is carried out in Child Development Centres and in other hospital settings (e.g. orthoptics, plastic surgery).

Children and young people aged 13-15 (inclusive) receiving in-patient or outpatient secondary care in Greater Glasgow (including Accident and Emergency attendances) are currently cared for within adult hospital services. Consequent upon recommendations in "Better Health, Better Care", the Kerr Report, Building a Health Service Fit for the Future (2005), and the Action Framework for Children and Young People's Health (2007) these patients will be cared for within the children's hospital services in the future albeit with an emphasis on ensuring the provision of patterns of service and facilities that are appropriate for their age and maturity. This will result in a 5-10% increase in activity across all sectors of RHSC.

In providing local hospital services to the children and young people of Greater Glasgow it is important to recognise that, as of the 2001 census, 25% of the children in Greater Glasgow live in areas characterised by maximum deprivation (Depcat 7). This concentration of deprivation is not replicated elsewhere in the UK and impacts on both the pattern and incidence of disease as well as aspects of service use, issues that require to be reflected in the patterns of service provision.

At a regional level the hospital supports a full range of specialist paediatric services comparable to the spectrum of specialties provided in an adult teaching hospital – cardiology, haemato-oncology, neurology, specialist surgical services, endocrinology and many others. In response to the specialist nature of these services and the long-term care that many patients receiving these services require, patients frequently remain under the care of RHSC at least until 15-16 years of age and sometimes older where appropriate.

These specialist services are accessed from across the West of Scotland Health Board areas and work in collaboration with, and in support of, the services provided in the District General Hospital paediatric units within the regional catchment area.

Yorkhill campus also hosts the regional Medical Genetics Service which includes services for children, adults and families. The relocation of the children's hospital will be accompanied by a requirement to relocate the Medical Genetics Services.

In addition to the aforementioned range of specialist regional services, RHSC is also host to a number of specialties which are designated as national services and for which, in most cases, it is the sole provider in Scotland.

These include :-

Kidney transplantation

Bone marrow transplantation

Cardiac surgery

Interventional cardiology

Extra corporeal life support (delivered in collaboration with three other centres in the UK)

Paediatric intensive care transport (shared service with Edinburgh)

Paediatric intensive care (from April 2007 – shared service with Edinburgh)

Complex airways surgery

Endoprosthetic bone replacement

Vein of Galen Aneurysm (UK service shared with Great Ormond St)

In-patient child psychiatry

Brachial Plexus Palsy

Cleft Lip and Palate (shared service with Edinburgh/Aberdeen)

The role played by RHSC in the delivery and support of both regional and national services is reflected in the fact that around 50% of the in-patient activity in the hospital arises from Health Board areas outwith Greater Glasgow and Clyde.

In considering the provision of specialist paediatric services it is pertinent to note that a number of aspects of the configuration and delivery of such services in Scotland are currently under review. This process includes, in particular, paediatric neurosurgery and haemato-oncology. The output of these reviews may realign service provision between the four specialist children's services in Scotland and may therefore impact on future activity levels and patient pathways albeit the result of these reviews will not be available until after the submission date for the Outline Business Case and therefore will be addressed within the Full Business Case submission for the New Glasgow Children's Hospital.

The national Cancer review will report in 2008 with the current likelihood of having no material impact on the exemplar design for the new Children's Hospital.

Neurosurgery will provide and initial report on adult services in 2008 but with no firm date as yet for reporting on paediatric neurosurgery. This Business case does not attempt to prejudge the outcome of the review. Even if complex neurosurgery were to be centralised in Glasgow it would only comprise 1 to 2 beds. In the unlikely scenario that every head injury and shunt procedure for Scotland were to be centralised then the impact would be more significant and difficult to give an accurate figure although it is estimated it would be no more than 8 to 10 beds. This could be comfortably accommodated within the design of the new children's hospital.

**Bed Modelling**

The RHSC currently has a total of 271 beds. These are configured as :-

14 ICU beds

6 HDU beds

23 Neonatal Surgical beds

185 In-Patient Ward beds (depending on activity levels some may be utilised on a five day basis)

14 Day Surgery beds

10 Medical Day Care beds

10 Short Stay Beds (23 hour acute receiving unit)

9 Child Psychiatry beds

In addition, there are approximately 8 paediatric neurosurgery beds (2 ICU and 6 HDU and ward) in the Institute of Neurosciences and an average of 12-15 in-patient beds in use across the adult sector for patients aged 13-15 years.

The RHSC currently utilises 7 main operating theatres plus a dental suite and has facilities for :-

| | |
|---|---|
| Cardiac catheterisation | Interventional radiology |
| MRI | CT scanning |
| Nuclear medicine | |

There are currently a full range of dedicated paediatric laboratory support services on the Yorkhill campus :-

| | |
|---|---|
| Haematology | Bio-chemistry |
| Microbiology | Virology |
| Pathology | |

In addition to supporting the work of the RHSC with specialist laboratory services and professional advice these services are also accessed in various ways by primary care and other regional centres. In particular the pathology service undertakes perinatal and paediatric post-mortems, including forensic examinations, for most of the West of Scotland Health Board areas.

## 4.4 DESCRIPTION OF FUTURE SERVICE REQUIREMENTS

The relocation of the RHSC to the Southern General site does not, of itself, fundamentally change the role of the hospital in the provision of local, regional and national services. Future service requirements of the hospital will therefore closely mirror those which currently pertain, namely the need to be able to provide the broad range and patterns of service currently delivered at RHSC and to accommodate the required activity levels in a way that ensures timely accessibility for all patient groups.

At a local level, in addition to providing secondary hospital-based care for children under 13 in the Glasgow area, the new hospital will require to accommodate those patients aged 13-15 years (and potentially some in the 16–18 years age group) currently admitted to adult hospitals across the city. This equates with some 1,500 admissions; 2,800 bed days; 470 day cases and 1,100 surgical procedures.

In addition, it is intended that, following co-location, the in-patient care of children undergoing neurosurgical procedures will also be provided within the new children's hospital. This currently involves 260 admissions and 1,670 bed days annually for patients aged 0-15 yrs.

The hospital will remain the main provider of specialist care for West of Scotland Health Boards albeit there may, over time, be some capacity for different models of shared care to be developed between RHSC and regional district general paediatric units which may allow some elements of the patient journey to be delivered nearer home. In that regard it should however be noted that a number of contrary drivers, which affect the sustainability of DGH paediatric services or argue for increased specialist input into care, have tended to increase inward referrals over recent years and there is no immediate evidence that this trend will not persist.

Equally, as the largest children's hospital and the host to a range of national services, the RHSC will continue to play a pivotal role in the overall delivery of specialist services for children and young people in Scotland. In that regard the models of care and service configuration for specialist children's services in Scotland are currently the subject of review by the National Steering Group for Specialist Children's Services and the resultant National Delivery Plan, circulated for consultation during spring 2008, may contain some recommendations that could impact on activity levels in a few specialities, most notably haemato-oncology. In a parallel, a national review of adult and paediatric neurosurgery may also bring forward proposals for service reconfiguration. Any such recommendations would require to be scoped and addressed in the development of the final business case.

In considering future service requirements it is also pertinent to note that for many hospital services RHSC is the sole provider either at a local, regional or, in some cases, national level. Indeed there are at least two specialities in which RHSC is one of only two or four providers in the United Kingdom. As a result there is a strong imperative to ensure that the pattern of accommodation and services provided in the new hospital is capable of maintaining activity levels commensurate with clinical demand and of coping with anticipated periods of peak activity.

In parallel there will be a requirement to ensure that known and anticipated performance targets for services for children and young people can be addressed.

A Community Engagement Team has been established to ensure patient, carer and community involvement in the development of the new hospitals. The Community Engagement Team has undertaken an extensive programme of consultation with families, support groups, charities, voluntary organisations and local community organisations.

### 4.4.1 Bed Model

Key to the ability of the new hospital to deliver activity levels that accommodate clinical demand is the incorporation of an appropriate bed model, both in terms of overall bed capacity and also the distribution of beds between critical care, in- patients and ambulatory/day care services.

As already identified, RHSC currently has 271 beds. In addition there are, on average, between 15 and 20 beds in Glasgow occupied by patients (young people aged 13-15 or neurosurgical patients) whose care will, in the future, be delivered in the new children's hospital. The current virtual bed pool of the patient population who will use the new hospital has therefore been calculated as 289.

In order to develop a credible bed model for the new children's hospital NHSGGC engaged the services of CHKS who have undertaken comparable work for the Health Board in the past and are also providing advice in respect of the bed model for the new adult hospital which is incorporated in this Outline Business Case.

In developing their recommendations CHKS utilised data relating to activity patterns for patients aged 0-16 in Glasgow hospitals (excluding Clyde) for the financial year 2004-2005. Speciality-specific performance, as measured by day case rates and average lengths of stay (ALOS), were measured against two peer groups of hospitals in England – a group of six specialist children's hospitals and a group of five teaching hospitals with significant paediatric facilities. In all areas the 2004-2005 data from the peer group hospitals was used as the comparator.

In addition, CHKS adjusted the bed model to reflect anticipated changes in the population over the next decade (based on General Register Office predictions) and differing levels of bed occupancy.

The analysis and recommendations in the CHKS report were underpinned by a number of key assumptions

- That the population would change in line with projected estimates. For the purposes of this exercise, and based on the predicted changed in the NHS GG 0-16 population over the next decade, a reduction of 11% was applied.

- That hospitalisation rates will remain steady such that a fall in population will result in a comparable fall in activity.

- That there will be no material change in existing referral patterns or service configuration.

- That all patients under 16 currently managed in Glasgow hospitals outwith RHSC would be accommodated in the New Children's Hospital (this excludes obstetric and adolescent psychiatric patients).

Based on the incremental application of the impact of

  - the predicted fall in the population of children aged 0-15

  - operating at best peer performance rates across all specialities

  - achieving occupancy rates of 85% elective work and 65% non-elective work

CHKS estimated that there could be a potential reduction of 72 in-patient beds albeit this would required to be accompanied by a sufficient increase in day case and short-stay beds to accommodate the necessary changes in practice in favour of ambulatory and day care that are required to deliver the overall bed reduction. Taking these issues into consideration the final recommendation from CHKS favoured an overall bed complement of 245 beds.

The CHKS review did not include any recommendations regarding in-patient child psychiatry which currently incorporates 9 beds and delivers a national service. Existing occupancy rates and patterns of use suggest that the service could be maintained without loss of quality from a pool of six beds. A further adjustment of the proposed internal configuration of services within the new children's hospital was also agreed which was seen to offer increased flexibility and efficiency of bed utilisation and as a result the proposed bed model for the new children's hospital is based on a total of 240 beds, a reduction of nearly 50 beds from the total bed pool currently available to the relevant patient population.

It is proposed that the total of 240 beds will be configured as

193 In-Patient beds (including critical care areas, wards, psychiatry and 23 hour beds)

20 Short-Stay beds (emergency receiving)

27 Day Care/Day Investigation

In order to deliver the desired objective of a combined neonatal medical and surgical service serving both the maternity and children's hospitals on the Southern General site twelve of the 240 beds will be provided within the redeveloped maternity / neonatal building on the Southern General site to which the new children's hospital will be immediately juxtaposed. These 12 neonatal intensive care cots will be accessed by neonatal surgical patients currently cared for in RHSC. As a result, the bed capacity of the new children's hospital building itself will be 228.

The proposed overall reduction in bed numbers and the accompanying shift in focus in favour of day and short stay care will require a significant redesign of patient pathways and the ways in which services are configured. A wide-ranging service redesign programme is currently being progressed within the NHS GG&C Women and Children's Directorate in order both to consolidate proposals regarding future service configurations and to ensure that there is opportunity to test new models of care well in advance of the opening of the new hospital. This programme will also incorporate work with Regional Planning structures and other West of Scotland Health Boards in order to identify and accommodate any anticipated changes in service patterns which will impact on the future role and contribution of the Royal Hospital for Sick Children.

## 4.5 PROJECT OBJECTIVES

The objectives of the scheme are given below. They are categorised under the four headings of :-

- Clinical Effectiveness and Safety for Patients
- Fit for Purpose of Facilities
- Positive Impact for Staff
- Maintain and Enhance Academic Links

The following describes each in more detail: -

### 4.5.1 Clinical Effectiveness and Patient Safety

Fundamental to the rationale for locating the new children's hospital at the Southern General site is the requirement to achieve the clinical benefits of co-location with adult and, in particular, maternity services.

Restoration of linkage between maternity and paediatric facilities which currently exists on the Yorkhill site will allow the continuance of the services which have developed to ensure high quality care for the foetus at risk and the new-born infant with serious or life-threatening problems. These services support diagnosis, advice and intra-uterine management in the case of a foetus with significant abnormalities, the appropriate management of labour and the capacity to operate or undertake other interventions on the new-born baby without unnecessary transfers or inappropriate separation from the mother.

The co-location with the adult hospital, will also support engagement with adult services and clinicians which will offer particular assistance in the management of adolescent patients. This will become particularly relevant as the age limit for the children's hospital is elevated to the 16th birthday. Some specialties, for example gynaecology, are not replicated in paediatric practice but will be reflected in the clinical activity profile of the hospital with the change in age limits. The capacity to engage readily with specialist expertise from outwith the children's hospital will be a major clinical advantage in such instances.

The transition of young people with long-term clinical conditions from paediatric to adult services has long been recognised as challenging for the patient and family. The presence of co-located services can facilitate better transition arrangements and minimise the difficulties encountered during the transition process.

Modern health care increasingly incorporates multi-disciplinary and cross-specialty approaches, particularly in the management of complex problems. Interventions may require the concurrent involvement of multiple specialists. The configuration of the new hospital including, in particular, the integration of theatre and diagnostic imaging and intervention suites will support the best of modern practice in these clinical scenarios.

Many clinical areas in the current RHSC are required to manage a mixture of emergency and elective activity and a mix of patients with significantly varying severity of conditions and expected lengths of stay. The complexity of such arrangements mitigates against well-structured care pathways and best practice. The opportunity to configure the hospital to specifically accommodate differing care pathways will not only increase organisational efficiency but also enhance patient care and safety.

There is a clear recognition of the benefits of much closer integration of neonatal medical, surgical and medical intensive care facilities than has previously been possible on the Yorkhill site. Arrangements are being made to take forward such integration within the existing campus but the development of purpose-built facilities designed around such an integrated service will support high quality multi-disciplinary care to this very vulnerable patient group.

Healthcare acquired infections remain a major source of morbidity and prolonged hospital stay. The new hospital will be designed in accordance with best practice in terms of infection control principles and should thereby minimise the occurrence of HAI and the allied risks.

An additional advantage of a new children's hospital will be the opportunity to ensure the centralisation of all paediatric A&E activity. This proposal, which accords with guidance on the provision of Accident and Emergency services to children, has already been agreed in principle but would have required significant capital investment at the existing RHSC given that it will result in a substantial increase in A&E attendances. The provision of new hospital facilities will allow the development of a purpose-built paediatric A&E department designed around modern emergency care practice and supported by adequately sited and sized short-stay and assessment facilities to minimise hospital admissions.

Information technology plays an increasingly vital role in the support and delivery of best clinical practice. The new hospital will offer an opportunity to incorporate state-of-the-art information management arrangements which will facilitate good care, minimise risk and ensure efficient working practices. Telemedicine is now an integral part of the role of RHSC as a tertiary referral centre. The capacity to include telemedicine capability in the relevant areas of the new hospital will significantly enhance the hospital's role in supporting and co-operating with children's services elsewhere in Scotland and in ensuring patient transfers are safe and timely.

Finally, although difficult to quantify, there is evidence that the construction and environment of a hospital can have a direct impact on patient well-being and recovery times. The use of modern design principles, enhanced by other influences (e.g. artwork) that improve the built environment, should have a positive influence on patients.

### 4.5.2 Fit for Purpose Facilities

Although not as old as many other hospital buildings within Glasgow the RHSC is not designed around current patterns of hospital-based care. Aside from issues relating simply to the age of the building the configuration of the clinical areas is either designed around models of care from the 1950s and 60s or, in regards to more recent development, has been shaped by limitations of space and operational feasibility.

The opportunity to develop a "Fit for Purpose" hospital built around current and future patterns of patient care will offer significant advantages to staff, patients and their families. These include, in particular, the ability to support closer working between the intensive and high dependency care areas and the facilities with which they interact e.g. theatres, diagnostic imaging.

- integrated neonatal medical and surgical services
- well structured dedicated 23 hour, day and ambulatory care services
- appropriate separation of emergency and elective activity
- integrated theatres, MRI and interventional radiology facilities for complex multi-interventional procedures

In addition the resultant ease of patient and staff movement between these areas as and when required, will offer not only better, more efficient and ultimately safer pathways of care but will also have a direct impact on the sustainability of staff rotas, the delivery of Hospital at Night models of care, better infection control management and the more efficient use of resources.

The New Children's Hospital will also provide the opportunity to ensure the centralisation of all paediatric A&E activity which will result in an increase in attendances from 38,000 to 46,000 per annum.

The scheme, through the provision of new hospital facilities will allow the development of a purpose-built paediatric A&E department designed around modern emergency care practice and supported by adequately sited and sized short-stay and assessment facilities to minimise hospital admissions.

The configuration of the hospital will also support access from A&E to Diagnostic Imaging and swift transfer to ICU as well as being able to develop any clinically useful synergies with the adjacent adult A&E department with which it will share emergency ambulance routes.

***Child, Parent and Family-Friendly Facilities***

The different psychological, developmental and clinical needs of infants, children and young people, their dependence on parents and carers and the complex dynamics of the wider family circle require that hospital facilities for children and young people are specifically designed around their particular needs.

This requirement has been increasingly recognised in the design of children's hospitals developed in the UK and internationally in recent years and the new children's hospital will have the opportunity to draw on a growing range of innovative ideas and design options in order to provide an environment practically and aesthetically suited to children and families.

One particular age-group traditionally neglected in the provision of hospital facilities are adolescent patients. The new hospital, which will accommodate all children and young people up to the 16$^{th}$ birthday (and some 16-18 year olds) will incorporate facilities designed to address the particular developmental, psychosocial and educational needs of this patient group.

Parents and carers not only provide emotional support and comfort to children in hospital but are also key partners in their care. The current RHSC does provide a number of single cubicles and offers some space for a parent to stay with a child but the accommodation is limited and in the four bedded and other ward areas the provision for resident parents is far from ideal in terms of space, comfort, privacy or access to toilet and allied facilities.

The hospital inpatient area is planned on 57% single rooms the rest being within 4-bedded areas. This was agreed following consultation on the appropriate mix of single/multi-bed wards for Children. The outcome of the consultation with children, young people and their carers was that there was a strongly expressed preference from both patients and parents for the retention of a mixture of single rooms and small bed bays (2-4 beds). This mixture was seen to offer flexibility in addressing a number of factors including the level of the illness, the need for isolation, the need for company to aid recovery, and the preference of teenagers in particular either for privacy or companionship. Such a mixture of accommodation is also in line with extant 'best practice' statements regarding adolescent care.

The Clinical Advisory Group also agreed that there should be a mixture of single and multi occupancy rooms within wards. It was accepted that there was a need for higher levels of single rooms in assessment areas and Intensive Care.

A key element of planning within the ward areas will be the inclusion of parental bedside facilities throughout the hospital (specific and different provision will be required in intensive care areas). This will not only address the personal needs of parents or carers but will significantly enhance their capacity to contribute appropriately to their child's care as well as lessening the infection control risks inherent in crowded accommodation.

In addition to bedside parental accommodation the current RHSC benefits greatly from the availability of additional parent/family accommodation provided adjacent to the site by the charities Ronald McDonald House and CLIC/Sargent. These facilities are particularly designed around the needs of parents/families of children who require prolonged hospital stays. Clearly the decisions regarding reprovision of such facilities alongside the New Children's Hospital will rest with the charities involved but there would be a clear intention to work closely with these respective charities to facilitate the continuation of the current, and much valued, arrangements at the new site.

***Patient Security***

The hospital will support parent, carer and family access in ways that differ materially from many adult departments. In the latter the pattern and volume of public movement in the hospital brings difficulties in terms of ensuring the safety and security of child patients. The New Children's Hospital will offer options to reconfigure public movement within the premises which will allow the introduction of modern security measures which are both as effective and as efficient as possible.

### 4.5.3 Positive Impact for Staff

Many of the potential advantages of the new children's hospital in terms of clinical care and a "fit for purpose" environment also constitute true benefits for staff. The capacity to facilitate high quality care with efficient care pathways and to maximise synergies within the children's hospital and with other services on the site combined with ease of access to enhanced academic facilities and opportunities all favour more efficient working and improved professional development and offer the attraction of working in a centre capable of sustaining a high reputation for the clinical care provided.

In addition a hospital within which departmental arrangements are configured to take advantage of the synergies between individual specialties and services will foster innovative and flexible working practices across the clinical disciplines with the resultant consequence of enhancing experience and job satisfaction as well as supporting more efficient staffing structures.

Equally, a hospital built to modern standards in terms of design, facilities (including dedicated staff facilities), equipment and space will provide an attractive, healthy and safe working environment.

Potentially the opportunities offered by a new children's hospital located in such a way as to maximise the opportunities and benefits inherent in the overall development proposed for the Southern General site are comparable to the best international centres. Such an arrangement will play a major future role in attracting and retaining high quality staff of all disciplines.

The development of an acute triple co-location campus of the size and scale which is envisaged for the Southern General site as a whole is also likely to include or attract a range of professional, social and recreational facilities either within or in the vicinity of the campus from which staff at the new children's hospital, along with other staff working on the site, can benefit.

### 4.5.4 Maintain and Enhance Academic Links

RHSC, as the largest children's hospital facility in Scotland, is a key centre of under-graduate and post-graduate teaching and clinical research. The infrastructure to support these activities on the current Yorkhill site is increasingly in need of new investment in terms of teaching accommodation, clinical skills facilities, clinical trials accommodation etc. As a result, the capacity, within the existing Yorkhill campus, to host significant local, national and international training events and conferences is extremely limited in a way that is detrimental to the hospital fulfilling its wider academic role.

The re-location to a site which will become a major hub of education and research and will have appropriate facilities to sustain these activities will address these long standing needs and thereby allow the hospital to better fulfil its potential as a major centre for teaching, research and development in the field of child health.

In addition, the opportunities afforded by co-location will foster increased academic collaboration between paediatric, obstetric and adult specialities across a range of common education research interests.

# 5. THE NEW SOUTH GLASGOW HOSPITAL DEVELOPMENT (NEW ACUTE ADULT HOSPITAL)

This section describes the following aspects of the Acute adult hospital development: -

- The case for change
- Overview of the Acute Services Strategy
- Description of current service at Southern General
- Proposed future adult services on the Southern site
- Project Objectives

## 5.1 THE CASE FOR CHANGE – ACUTE SERVICES WITHIN GLASGOW

Health Services in Glasgow are on the verge of a dramatic and exciting change. Following a decade of planning and public consultation, proposals to modernise the acute health services in Glasgow were approved in 2002 by Malcolm Chisholm, the then Minister for Health. This 10 year multi-million pound strategy will see the transformation of acute services across the city including the replacement of outdated Victorian buildings, and the creation of one-stop/rapid diagnosis and treatment models for the vast majority of patients.

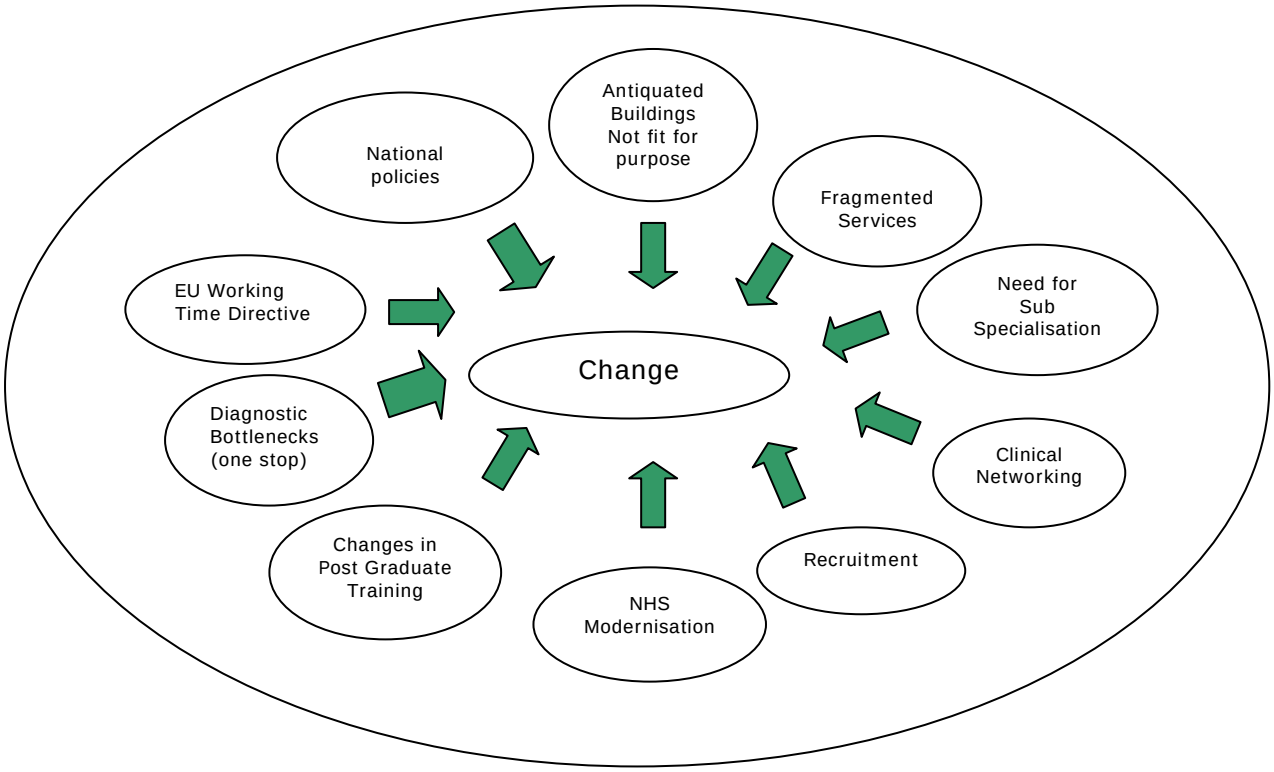
*"This has been a long and extensive process taking many views from people across Glasgow. In those three years there has been a range of views put forward during the consultation, but the common strand running through the consultation is that maintaining the status quo is not an option. It is time to move onto provide high quality, modern healthcare for patients in Glasgow. It is time to move on from the outdated buildings which are unsuitable for modern healthcare" Malcolm Chisholm 2002.*

NHS Greater Glasgow and Clyde recognise that the need to ensure that patients who require access to hospital care can be seen, fully investigated and treated as quickly as possible within the appropriate facilities. For patients presenting as an emergency there should be access to specialised care of the highest quality, with access to state of the art investigations and treatment facilities on a 24 hour /7days a week basis. For elective care, patients should be seen, investigated and leave the hospital with a diagnosis and treatment plan wherever possible on the first visit /same day visit. Underpinning this should be effective information and computer systems which allow GPs, Specialists and patient access to all relevant information needed to deliver high quality and effective patient care.

In 2002 Greater Glasgow Health Board described the case for change, which identified that the status quo was not an option as there was significant challenge to the sustainability of the configuration of services and to their ability to improve patient pathways and create more efficient and effective care pathways. All of the factors identified remain relevant today with additional challenges and pressures resulting in even greater need to reduce hospital sites and duplication of services.

In brief, the pressures for radical change in the way Acute Services are delivered in Glasgow are shown in the diagram below.

**PRESSURES FOR CHANGE**



The following describes these pressures in more detail.

The main drivers for changes are this

- **Policy Imperatives** - 'Better Health, Better Care' drives: reductions in waiting times; fast track access to rapid diagnosis and treatment; the provision of services designed around the needs of patients; modernisation of health care through better use of technology; and improved integration with primary and secondary care and reducing inequalities in health. To achieve these objectives a major programme of redesign of services, investment in buildings and information technology is required, making services smoother, more accessible, enhancing the quality of the outcome for the patient and achieving the objectives advocated by Better Health, Better Care" and other national policy initiatives.

- **Fragmented services** – there is a requirement for patients to move within and around sites and different buildings with an inevitable loss of continuity of patient care. Important co-locations of services are not possible and there are difficulties in transferring information between services to support patient care.

- **Increasing sub-specialisation in medicine and surgery** - there is a move towards larger teams to ensure all patients can get access to the appropriate specialist treatment; whereas in the past a single surgeon may have performed a wide variety of operations, now more procedures are available and specialties increasingly deal with particular morbidities and parts of the body. Diagnosis can also be a multi-disciplinary task often requiring patients to be seen by a number of expert staff before diagnosis can be made. Having expert staff together and closely integrated facilities this process allowing treatment to commence as soon as possible

- **Pressures on Staffing and Rotas** – currently there are too many inpatient sites each requiring emergency on-call rotas resulting in pressures on staff. Modernising Medical

Careers and the European Working Time Directive impact upon the availability of medical staff and therefore the sustainability of rotas. In short, the fundamental redeployment of staff, Glasgow is facing an over-stretched workforce with patterns of working, which are difficult to sustain and are unaffordable.

- **Outdated buildings** - many of which are Victorian, dating from 1870's and are unfit for modern healthcare. It is significant to note that many of the original buildings still in clinical use today were contemporary with Joseph Lister. This causes difficulties in providing an efficient, smooth running service. The Victorian buildings provide unsuitable diagnostic and imaging facilities which restrict capacity, create bottle-necks and inhibit the provision of one stop/ rapid access diagnosis and treatment models. Some refurbishment has taken place but there are still several limitations and inflexibility to: change in use, access to and within the buildings and the ability to increase capacity. Patient transport within the sites and around the sites and different building inevitably delays patient care, causes patient discomfort and increases risk of patient safety and discontinuity of patient care. In addition, co-location of interdependent services is often not possible. The existing labyrinthine circulation complicates way finding for members of the public and greatly reduces general and security efficiency.

In summary, the status quo is not an option, as it will result in the following:

- A failure to provide a safe clinical service in accordance with nationally recognised standards;
- A failure to provide good clinical services with enhanced outcomes through sub-specialisation and redesign.
- Failure to sustain services. For example, many of the existing clinical teams are too small to sustain rotas across multiple sites. In some cases it may be possible to continue the service with significant use of external staff agencies but with a corresponding knock on affect to quality and expenditure.
- An increased incidence of elective cancellations to cope with the rising emergency workload. The consequence of this trend will be a reduced ability to deliver elective activity with a shift towards an 'emergency only' service;
- Failure to attract and compete for staff, especially in areas of acute shortages;
- Failure to provide a modern service with sub-specialisation and up to date technology;
- Rising cost of maintaining Victorian building estate

## 5.2 OVERVIEW OF THE ACUTE SERVICE REVIEW (ASR)

To address the pressures discussed above the Health Board have developed a dynamic strategy of reconfiguration and investment. The key components of the acute strategy are as follows: -

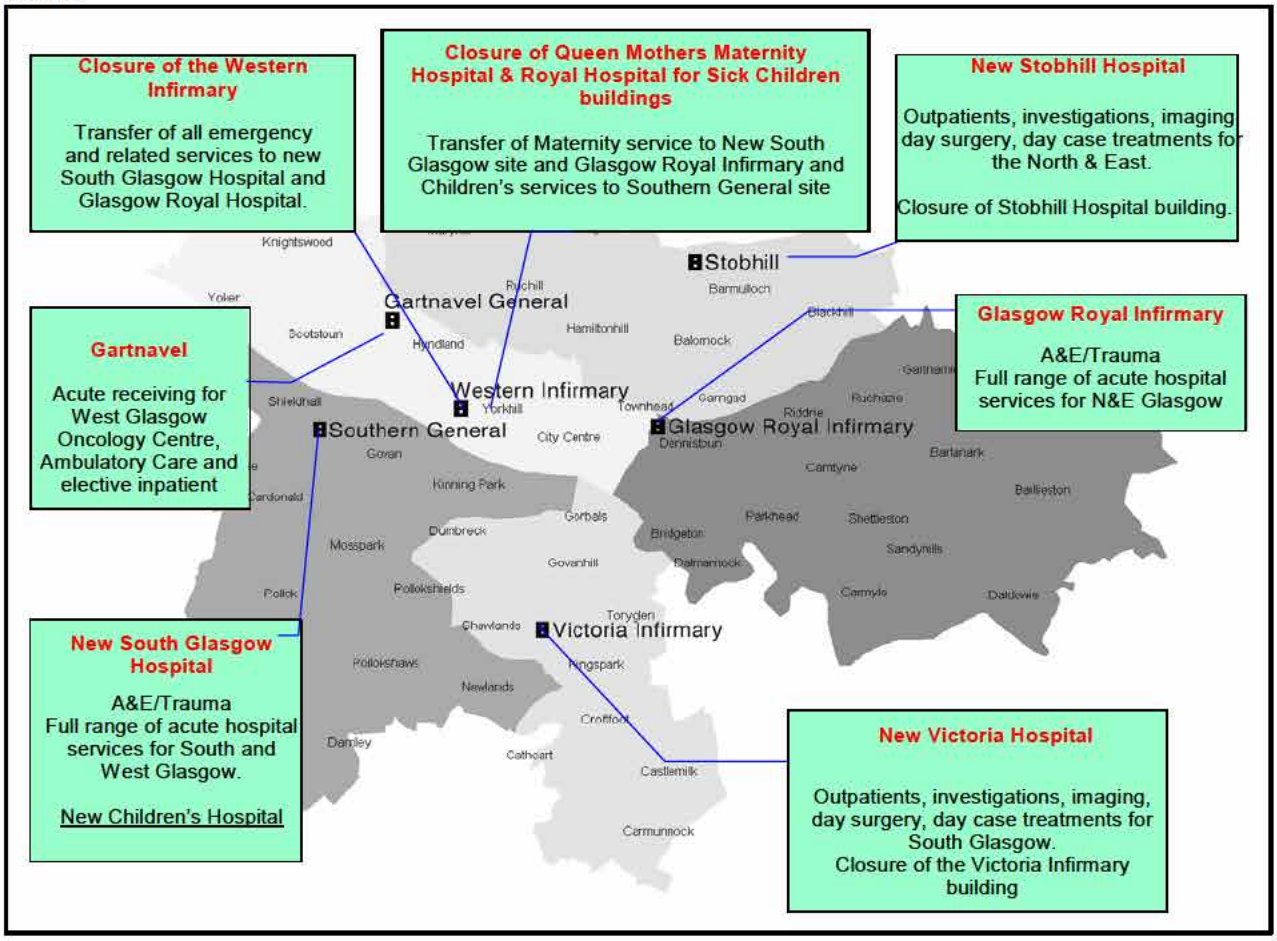
- A new build West of Scotland Cancer Centre on the Gartnavel site.
- Transfer of Cardiothoracic and Interventional Cardiology Services to the Golden Jubilee National Hospital (2008).

- Two new ambulatory care hospitals (ACH's) on the Stobhill site and the site adjacent to the Victoria Infirmary to support the future reduction from 6 to 3 adult in-patient sites. The three inpatient acute sites will be the Glasgow Royal Infirmary, the Southern Glasgow site and Gartnavel General Hospital.
- The number of maternity units in Glasgow will change from 3 to 2, these being at the Southern General Hospital and Glasgow Royal Infirmary.
- The number of Accident and Emergency Departments will be reduced from 4 units and a casualty to two A&E Trauma units, which will be based at Glasgow Royal Infirmary and the Southern General site. Trauma and orthopaedic in-patient services will be provided from these two A&E sites.
- There will be 5 Minor Injuries Units located at Glasgow Royal Infirmary, Southern General Hospital, the New Stobhill and Victoria Hospitals and at Gartnavel General Hospital.

The redesign and redevelopment of Glasgow's acute services will address many of the pressures currently facing the hospital service. The new services will be provided in modern facilities rather than in 19th century buildings. The purpose-designed facilities will enable the one-stop/rapid diagnosis and treatment models required for the future. Concentration of services will allow the requirements of junior doctors' hours and issues arising from increasing sub-specialisation of medicine to be addressed through the creation of larger teams and sustainable rotas for both junior and senior staff.

The formation of larger clinical teams will ensure that programmes of work, including the need to cover emergencies without interfering with waiting list and ambulatory care sessions, can be planned effectively. The concentration of in-patient services on fewer sites will help strengthen specialist services and maximise the capacity of the service.

The planned future configuration of acute hospital services in Greater Glasgow is illustrated below.



## Description of the 4 ASR Phases

### *The phased Implementation of the Acute Services Review*

The implementation of the Acute Services Review Strategy is planned over four phases, these are described below:

The first phase is well underway and involves the two new build Ambulatory Care Hospitals currently under construction at the site adjacent to the Victoria Infirmary and Stobhill Hospital site, the centralisation of cancer services at the new Beatson West of Scotland Cancer Centre built at Gartnavel General Hospital and the development of the West of Scotland Heart and Lung Services at the Golden Jubilee National Hospital, replacing facilities currently at the Western and Glasgow Royal Infirmaries.

This first phase of investment will see these new facilities commissioned over the period late 2007 to summer 2009, which will result in not only significant modernisation of Glasgow's healthcare facilities and creation of single centres of excellence but will also result in 4 of Glasgow's major adult hospital sites operating below capacity.

Phase 2 of the Acute Strategy involves the development of the new South Glasgow Hospital campus which not only sees the single biggest phase of modernisation and rationalisation of Glasgow's adult clinical services, but incorporates the creation of a new Children's Hospital for the Greater Glasgow and West of Scotland populations and the completion of Glasgow's Maternity Services modernisation.

On completion of the development of the new adult hospital in 2014, the Board will be able to enact the following:

- inpatient services in the Victoria Infirmary to transfer to the new development thus vacating the Victoria Infirmary site;
- inpatient services at the Mansion House Unit (MHU) to transfer allowing closure of the MHU;
- inpatient services housed in outdated buildings on the southern site to be relocated;
- transfer of Accident and Emergency services and associated beds at the Western Infirmary enabling closure of the Western Infirmary.

By 2014, following some major refurbishment and new build works within the existing estate at Glasgow Royal Infirmary and Gartnavel General Hospital, sufficient capacity will be created, following the opening of the new South Glasgow Hospital, to allow the 3 site inpatient configuration of adult services to be implemented.

Phase 3 of the Acute Services Strategy sees the major redevelopment and modernisation of the Glasgow Royal Infirmary campus and this work will be developed with a view to being brought forward for funding consideration in the period beyond 2015 followed by the final phase, which would see the redevelopment and modernisation of the retained adult inpatient services required on the Gartnavel General Hospital campus undertaken.

The key milestones of the Acute Services Review to date can be found in Appendix 3.

Further detail about the Acute Services Review and the reconfiguration of services is available in the document 'The Clinical Strategy for Glasgow's Acute Services 2006/7-2013/14'. This is available from the Health Board website.

## 5.3 DESCRIPTION OF THE CURRENT SERVICE AT SOUTHERN GENERAL

This section describes the current patient services based at the Southern site, the current buildings and use, site constraints and opportunities.

### 5.3.1 Patient Services

The Southern General Hospital is a large teaching hospital with an acute operational bed complement of 900 beds. The hospital is sited in the south-west of Glasgow and provides a comprehensive range of acute and related clinical services.

District General Hospital services are provided for the south-west of the city, with some services provided for the whole city. Services include Accident and Emergency, Dermatology, ENT, General Medicine (including sub-specialities), Assessment, Rehabilitation and Day Services), Gynaecology, Neonatal Paediatrics, Obstetrics, Ophthalmology, Orthopaedic Surgery, Urology, Physically Disabled Rehabilitation and Continuing Care. The Obstetrics, Urology, Ophthalmology and Dermatology Departments provide the single in-patient location for the whole population of South Glasgow.

The Maxillofacial Department for the city was centralised at the hospital in the autumn of 2002 providing trauma and elective surgery and specialist provision for head and neck cancer. South and West Glasgow's in-patient Gynaecology service was centralised at the Southern General Hospital in late 2003/early 2004. The Assessment and Rehabilitation service for the Physically Disabled is provided for the whole city from the Southern General Hospital. There is also a wide range of diagnostic and therapeutic services including Audiology, Clinical Psychology, Dietetics, Occupational Therapy, ECG, Physiotherapy, Radiology (including MRI and CT provision for the general hospital service) and Speech Therapy.

The Institute of Neurological Sciences

The Institute of Neurological Sciences is based on the Southern General campus and provides Neurosurgical, Neurological, Clinical Neurophysiology, Neuroradiological and Neuropathology facilities for the West of Scotland. The Institute is equipped with 2 Magnetic Resonance Imaging Suites, SPECT Scanner, two Computerised Axial Tomography Scanners, and angiography facilities. The Institute has recently undergone a major upgrade to incorporate ENT and Oral & Maxillofacial and is now equipped with additional facilities including the development of a new ward, four additional theatres, intensive care and a new out-patient department.

Westmarc

The Westmarc unit houses the clinical services for prosthetics and orthotics, including the Artificial Limb and Appliance Centre, within a purpose-built facility. The centre is staffed jointly by hospital and university personnel from the National Centre for Training in Prosthetics and Orthotics of Strathclyde University.

Podiatry

The Department of Podiatry has a purpose built 24-chair clinic including a minor procedure theatre.

Spinal Injuries Unit

The Queen Elizabeth National Spinal Unit for Scotland provides a spinal injuries service to the whole of Scotland. This is housed in a purpose-built facility attached to the Institute of Neurological Sciences.

### 5.3.2 Buildings

The Southern General site extends over 28.9 hectares and is located in Govan, South West of the City Centre. The site and the buildings within it are owned by NHS Greater Glasgow and Clyde on behalf of the Scottish Ministers and incorporates the area of land earmarked for the development of the new Children and Adult hospitals and lab build.

The facilities which make up the Southern General consist of a mix of buildings of varying ages, architectural style and quality spread across the site. The buildings date from 1872 when the original hospital was built. In 1902-05 a facility accommodating a further 700 beds was built as the hospital continued to expand its services. A new maternity unit was opened in 1970 and the Institute of Neurology Sciences was completed 2 years later. Both of these buildings have been subject to a major external and internal refurbishment to improve patient, clinical and support accommodation. There has been a number of more modern additions to the campus over the last 5 years including the Department of Medicine for the Elderly, the Westmarc building (rehab) and extensions to both the biochemistry and pathology buildings.

There are two listed buildings within the site. These date from the mid/late 19$^{th}$ century and constitute a two storey hospital block with iron-crested French roofed pavilions and a small square foyer and a 3 storey hospital block with a distinctive clock tower.

The current Southern General Campus has evolved over 130 years. A large capital investment has been made in the site over the last 15 years; rationalising the sprawling Victorian layout into a more cohesive densely packed site to better meet the demands of a modern Adult Acute hospital. Despite this investment the constraints imposed by the current mix of buildings precludes further development of the estate to deliver 21$^{st}$ century Adult Acute care without major redevelopment.

The suitability of remodelling a large portion of the current site to meet future Healthcare demands is unfeasible. Some 30% of the existing site was constructed pre 1910, these buildings house the general medical, general surgical, orthopaedic, urology and ophthalmology inpatient accommodation for the site together with the main site Imaging department. These Victorian buildings have been refurbished many times over the last few decades in an attempt to accommodate changing demands of healthcare delivery, Best Practice and statutory legislation. At present, the majority of these buildings do not meet accepted standards for Statutory Compliance or Functional Suitability. It is doubtful, that given the constraints of the buildings, whether even with extensive Capital Investment these buildings can comply with legislation for the current clinical functions in the short term.

As with all hospital sites of this vintage piecemeal development throughout the lifespan of the site has resulted in the fragmentation of clinical facilities across the campus, resulting in a number of very poor clinical adjacencies and departmental relationships. Theatres are spread throughout a number of locations on site with each theatre suite dedicated to an individual specialty. Rather than being co-located with the Regional Neurosciences and National Spinal Injuries facilities the A&E department is located next to the main rehabilitation facility for the site. At present given the sprawling layout of the site there are two imaging departments one co-located with the neurosciences/spinal complex and the other at the north of the site to service the main general medical and surgical inpatient facilities. The latter imaging facility however is not co-located but at some distance from A&E and the main outpatients department. The Condition Survey of the Southern General estate is enclosed in appendix 4. It can been seen that there are some buildings which are physically in reasonable condition but collectively not suitable to provide an efficient redesigned service.

The total square meterage of the buildings within the southern site is approx 89,000m$^2$ and the following illustrates the main usage of the buildings:-

| MAJOR CLINICAL AREAS | | MAJOR NON-CLINCAL AREAS | |
|---|---|---|---|
| Inpatient areas | 29% | Clinical & Non-clinical support | 12% |
| Outpatient clinics | 10% | Training & Education | 2% |
| Day case facilities | 3% | Staff facilities | 4% |
| Theatres | 8% | Facilities Support | 3% |
| Diagnostic - Imaging | 5% | Research facilities | 2% |
| Diagnostic – Laboratories | 6% | | |
| Rehabilitation Facilities | 7% | Car parking | 1500 |
| Emergency Medicine (A&E) | 2% | | |
| Other areas constitute a further 7% | | | |

### 5.3.3 Site Constraints and Opportunities

The Southern General site is bordered and accessed from the north by Govan Road and on its west side off Hardgate Road.

The eastern boundary is formed by the Clyde Tunnel approach and Moss Road. The southern boundary is bordered by residential property. Road access is not currently available along either of these edges.

The north-western corner of the site between Govan Road and Hardgate Road is bordered by existing industrial land and Sheildhall Water Treatment Works. At present Hardgate Road does not extend beyond the Treatment Works and therefore does not link with Govan Road. Aerial photographs showing the boundaries of the site are shown in the Appendix 5.

The existing hospital buildings are spread out over a large area of the site and in a number of cases require elevated bridge links across the spine road. Surface car parking is distributed sporadically adjacent to the numerous entrances arising from the existing fragmented site layout.

A number of bus services pass close to, or through, the site.

Emergency blue light traffic use the same spine road network to access A+E, Maternity and Neuro/Spinal Injuries.

An area within the site, which is 15.5 acres or 6.3 hectares, can be released by the end of 2009. This land will form the development area for the new Royal Hospital for Sick Children (RHSC), Adult Acute Hospital and new laboratory block and allows these new facilities to be built in one continuous phase while the existing SGH services continue to operate.

The potential for interruption to day-to-day services and facilities within the site during construction has been carefully analysed, and will be managed by a series of enabling works to decentralise the main hospital boiler plant by isolating the construction site from the remainder of the hospital with materials and construction traffic accessing the site from a discreet entrance off Hardgate Road and a link road to Govan Road that presently exists within the site. It is envisaged that the hospital will continue to operate uninterrupted on a day-to-day basis construction and commissioning of the new facilities.

## 5.4 PROPOSED FUTURE DEMAND - BED MODELLING

Plans for the adult hospital include 1109 beds and an Emergency Department with the capacity for 110,000 attendances per annum. The hospital will function as an acute 'hot' site with an outpatient department serving the local population and a small medical day area. The surgical day case activity will take place at the New Victoria Ambulatory Care Hospital opening in 2009.

The following section describes the bed modelling work which has informed the size and scope of the new hospital.

**Benchmarking with Peer Hospitals**

NHS Greater Glasgow and Clyde (GGC) appointed CHKS (an independent clinical activity analysis service which the Board has worked with for a number of years) to undertake bed modelling exercises for acute adult services across Glasgow. The objectives of the review was to:

- Provide an objective assessment as to the current performance of the acute adult hospitals across Glasgow relative to their peers;
- Identify the potential for improving efficiency in terms of use of beds and patient throughput;
- Provide a projection of future demand in 2015;
- Provide an indication as to the potential bed requirements.

The bed model also takes cognisance of better clinical adjacencies, more efficient patient pathways, projected demographics and national policy adjustments.

Within the core specialties covered by the Adult Bed Model there are currently 3047 inpatient beds across the 6 acute sites, against which the future bed provision is considered. The bed model for the Acute Services was updated during 2007 using the 2005/6 activity, and performance information to identify the currently proposed bed model supporting the outline business case. In considering the Adult Bed Model 2005/06 data was used to consider the

efficiencies to be delivered through improved performance of Glasgow's hospitals compared to the inner city peer hospitals across the UK.

By incrementally applying the impact of,

a) operating at best peer performance rates across each specialty;
b) achieving occupancy rates of 85% for elective work and 82% for non-elective activity;
c) growth in medicine and the impact of demographic changes;
d) performance targets on current and future activity such as waiting times;

the number of beds required for the core specialties for implementation of the Acute Services Review suggests a bed model of 2912. This number excludes beds associated with the following services:- clinical haematology, oncology, plastic surgery and burns, oral surgery, neurosurgery, homeopathy, spinal and physical disabilities.

Further detail of the bed modelling work is given at Appendix 6.

Modelling work has been undertaken to consider patient flows and the extant strategy position of single site specialties in relation to the number of beds required in light of the future plan of 3 inpatient sites for the city at Glasgow Royal Infirmary, Gartnavel General Hospital and at the Southern General Hospital site. In addition, consideration has been given to potential developments to specialist services in Glasgow and changes to patient flows from Clyde in understanding the inpatient bed capacity required across the Glasgow Acute Hospitals.

At the time of undertaking the latest bed modelling exercise for the ASR it was recognised that there might be future changes to bed numbers as the result of changes to regional services provision such as neurosciences, oral-maxillofacial services, renal services, gynae-oncology services. With the exception of renal services, which has already been factored into the new South Glasgow Adult Hospital bed requirement other potential changes to requirements in relation to beds do not affect the new South Glasgow Adult Hospital current proposals and would be accommodated beside existing services.

Similarly the requirements for South of the River Strategy for Clyde, consulted on during 2006/7, indicated that changes to inpatient service provision for Vascular Surgery, ENT, Dermatology and Haematology. This work has informed the potential bed configuration that supports the 1109 beds in the New South Glasgow Adult Hospital.

As this is an iterative process the bed modelling work will continue and will be updated with a 2006/7 benchmarked position, which is currently being explored to consider the further levels of efficiency that could be implemented. This will be ongoing in the months and years ahead to ensure a continued focus on efficiency.

**New South Glasgow Hospitals**

The in-patient bed numbers used for planning purposes for the New South Hospital are as follows:

***Table 7 – Planned bed numbers for the New South Glasgow Hospital.***

| Specialty | In-patient Beds |
|---|---|
| General Medicine (Includes MHDU) | 407 |
| Haemato- Oncology | 14 |
| Dermatology | 18 |
| Nephrology (Includes Surgery) | 80 |
| Geriatric Medicine | 93 |
| CCU | 18 |
| ITU | 20 |
| SHDU | 23 |
| General Surgery & Vascular | 169 |
| Urology | 51 |
| Orthopaedic & Ortho Rehab | 141 |
| ENT | 37 |
| Clyde beds * | 38 |
| **Total In-patient Beds** | **1,109** |

* Clyde Beds

In line with the South of the River Strategy for Clyde, consulted and agreed on during 2006/07, the in-patient bed requirements for the following services have been included within the bed model for the new South Glasgow Adult Hospital – Vascular Surgery, ENT, Dermatology and Haematology.

The total number of in-patient beds planned for the New South Glasgow Hospital is 1109. In addition, a small 12 trolley medical day case unit is proposed for the New South Hospital, this takes into account the activity which will be seen at the new Victoria Hospital.

**Retained Beds**

There will be approximately 630 beds retained on the Southern Campus associated with care of the elderly, maternity, neurosciences, neurology and spinal services.

## 5.5 SERVICE RE-DESIGN

Service redesign will be crucial in underpinning the new hospitals. The focus of this work will be around achieving a balance of care to ensure that patients are treated in the most appropriate setting. This concept will be underpinned by the interface between Acute Services and Community Health (and Care) Partnerships (CH(C)Ps), providing new models of care to improve pathways and support other redesign initiatives.

As well as this, these new models of care will look to maximise the full potential of the new Hospitals. Key National guidance and good practice will be incorporated in the models of care, including:

- Patient centred care
- Maximising the co-operation between primary, secondary and tertiary care
- Investing in the latest Information Technology (IT)
- Extending the roles of nurses, Allied Health Professionals and other non-medical personnel
- Fully utilising the most modern healthcare equipment and technology in patient care
- Improved links with Community Health (and Care) Partnerships.

The New Victoria and Stobhill Hospitals will be commissioned in 2009, and will set the scene for the new post ASR reconfiguration of services. The separation of planned and emergency care and the anticipated increase in day surgery rates will require major redesign in relation to how care is delivered. Much of the redesign work required at the new hospitals is already underway and is supported by the development of new roles; for example, the Emergency Nurse Practitioners role will be further developed to support new service models, such as the Minor Injury Units in the new Ambulatory Care Hospitals.

Currently work is underway through the Ambulatory Care Hospital planning groups in terms of service redesign. The redesign process will also be closely linked to the development and implementation of the Health Information and Technology (HIT) strategy and its phased rollout across the acute division. The methodology and templates being put into place to take this work forward will also be applied to the New South Glasgow Hospital ensuring consistency in care models and a streamlined, joined up flow of service provision within Glasgow.

The sections below highlight the mechanisms for taking forward redesign in relation to scheduled care, unscheduled care and diagnostics.

***Planned Care***

The major thrust of the redesign of services required for elective care will be focused on improved day surgery rates, the development of integrated care pathways, which promote pre-assessment, pre-admission planning and improved discharge and follow-up procedures. A Planned Care Collaborative was established in 2006, led by the Acute Division with CH(C)P input. The workstreams that form the collaborative are being used to drive the modernisation agenda and to determine key priorities for change.

This Planned Care Improvement Programme is tasked with improving and actively managing admissions to hospital or planned care.

Integral to delivering these improvements will be the implementation of 5 changes, these are to:

- Improve referral and diagnostic pathways;
- treat day surgery (rather than inpatient surgery) as the norm;
- actively manage admissions to hospital;
- actively manage discharge and length of stay;
- actively manage follow up.

In implementing ‘Better Health Better Care’ Boards have been tasked with achieving a shift in the balance of care and ensuring improvements are made in productivity and capacity, whilst sustaining improvements in waiting times and reducing the need for hospital admissions.

The Planned Care Improvement Programme reviews the flow across the whole system and will include implementation of support processes such as Patient Focussed Booking and Referral Management Services. The “New Ways” initiative to define and measure waiting times became operational in December 2007. This redesign concept sees patients being offered three appointments or admission dates within strict criteria and ensures that patients are tracked within the system or referred back to the primary referrer.

Work has begun towards the Government's 18 week referral to treatment commitment which has to be met by December 2011. The 18 week referral to treatment target sets out a whole journey waiting time target of 18 weeks from General Practitioner referral to treatment by 2011. This 18 weeks standard is different from previous waiting times targets as it will not focus on a single stage of treatment but rather the whole patient pathway. Meeting this ambitious target will be challenging and will require NHS organisations to carefully consider issues of service redesign, improved efficiency and, where indicated, extra activity and capacity. New approaches will be considered, developed and extended throughout the Scottish healthcare system to ensure the NHS succeeds in delivering this standard. Getting the appropriate workforce to achieve this significant change in service delivery and improvement will be key to achieving success. This will be an iterative process considering the workforce requirements both in the short term, in terms of addressing the backlog to bring us into line with the new target, but also in the longer term in relation to the ongoing service requirements. This will be delivered through existing staff working differently in redesigned services but also through a competency based approach to planning the capacity. This will help in expanding roles and avoid restricting the way services are delivered as currently in traditional roles and existing ways of working.
Strong links will be required with the Unscheduled Care Collaborative. Equally, the whole system approach will require close collaboration and joint working with CH(C)Ps in order to effect the desired changes and ensure long term sustainability of performance improvements such as impact on access and waiting time targets, day case rates, length of stay, patient journey time and whole system capacity.

***Unscheduled Care***

In the area of Unscheduled Care, work is currently underway through the Unscheduled Care Collaborative, established in 2006 and due to end in March 2008. The implementation of the Acute Receiving Project within Glasgow has modernised and transformed the front-end of the acute hospitals. This has allowed improved triage for patients, the introduction of streaming, separating patient flows and allowing minor injuries to be assessed and treated by Emergency Nurse Practitioners separate to the main A&E/Acute Receiving areas within Glasgow's hospitals. The Collaborative has reporting links both locally through the Project Sponsor and nationally through CCI.

The remit of the group is to:

- Support the achievement of the four hour A/E waiting time target through the Collaborative Programme and methodology application;
- Collate and monitor updates from the local hospital operational groups;
- Agree and implement future action plans;
- Ensure that a co-ordinated approach to change ties in with both local and national strategic direction
- Ensure adherence to unscheduled care performance milestones indicated in the Local Development Plan

Work is also ongoing around out of hospital care (Unscheduled Care Flow Group 5) to support the development of alternatives to acute hospital attendance and admission and to facilitate timely discharge for patients ready to leave acute care. The recently launched Long Term Conditions Strategy Framework is also focussed on the above outcomes and there are specific workstreams which will work towards minimising unnecessary hospital admissions through a planned care strategy

**Diagnostics**

Strategic Reviews of Imaging and Laboratory Medicine Services resulted in a range of service redesign initiatives. NHS Greater Glasgow and Clyde will put in place high-volume, no-wait services which support rapid diagnosis and treatment for all patients. The separation of emergency and elective flows will support the work towards the new targets. The modernisation strategies have resulted in automation of haematology and biochemistry laboratory services and in new medical technologies such as CT/PET in Imaging. Major redesign of the workforce for Diagnostic services will include a transition to full shift working, moving away from the traditional on-call arrangements currently in place. To support the delivery of the bed model for Glasgow, Imaging Services will be provided in A&E and Acute Receiving 24/7. This redesign strategy will achieve radical increases in capacity allowing NHS Greater Glasgow and Clyde to achieve a high volume no-wait service. Much of this work has been undertaken through the Diagnostics Collaborative, providing a good foundation on which to take forward further redesign.

## 5.6 PROPOSED FUTURE NEW ADULT HOSPITAL SERVICES (NEW SOUTH GLASGOW HOSPITAL)

The new hospital will be zoned into hot and cold zones with inpatient and day attendances within one section of the hospital and A&E resuscitation, majors, critical care, acute assessment, within another zone.

The Health Board have considered two scenarios with regard to adult single room provision. These are a base case with single room provision at 57% and an alternative with a 100% single room provision. The results of the appraisal of these 2 scenarios is given in the Financial Appraisal section in Chapter 9.

The will be separation of patient and staff routes through the building from visitor and facilities management flows. The schedules of accommodation reflect the opportunity for both new hospitals to share facilities such as a local pharmacy dispensing facility, aseptic suite, estates maintenance, waste compound, supplies delivery and distribution, kitchen, dining and other FM services.

Finally, a helipad is required with a rapid access route into the resuscitation area within A&E. The feasibility of a rooftop helipad is currently being explored.

### 5.6.1 Service Profile

The profile of specialties/services that will be provided at the new South Glasgow Hospital is set out in table 8 below. All specialties will be providing inpatient care; some, but not necessarily all, will be providing outpatient clinics and medical day-care services on-site.

**IN-PATIENTS**
The New South Glasgow Hospital will be a hot acute in-patient site. The proposed in-patient services are shown in table 8 below:

*Table 8: New South Glasgow Hospital - Proposed Service Profile – Inpatient Services*

| Surgical Specialties | Medical Specialties | Other Specialties/Services |
|---|---|---|
| General Surgery | General Medicine | A & E |
| Urology | Cardiology | Acute Receiving |
| Vascular Surgery | Dermatology | Minor Injuries Unit |
| Trauma & Orthopaedics | Diabetes & Endocrinology | Critical Care |
| ENT | Gastroenterology | Rehabilitation Services |
| Renal Transplant Surgery | Haemato-Oncology | (Complex Elderly, Surgical |
| | Medicine for the Elderly | Rehab, Orthopaedic Rehab & Vascular Surgery Rehab) |
| | Nephrology | |
| | Respiratory Medicine | |
| | Rheumatology | |
| | Stroke Medicine & Rehabilitation | |

## OUTPATIENTS

There will be a single outpatient department on the Southern site; the only exceptions to this will be:

- Children's Services (based in the New Children's Hospital)
- Obstetrics & gynaecology (located in the newly refurbished maternity building)
- Neurosciences (provided from within the Neurosciences Institute)
- Care of the elderly (provided from Langlands building)

The New South Glasgow outpatients department will provide local access to patients within the South West of the City.

The anticipated profile of outpatients clinics is shown in table 9 below:

*Table 9: New South Glasgow Hospital - Proposed Outpatients Clinics*

| Surgical Specialties | Medical Specialties | Other Specialties/Services |
|---|---|---|
| ENT | Cardiology | A & E |
| General Surgery | Dermatology | Rehabilitation |
| Ophthalmology | Endocrinology | |
| Orthopaedics | General Medicine | |
| Urology | Medicine for the Elderly and Stroke Services | |
| Vascular Surgery | Haematology | |
| | Respiratory Medicine | |
| | Rheumatology | |

**Principal Themes of the New Model of Care**

The key themes underpinning the new model of care are described below:

- Patient-focussed services
- Systematic and managed services providing
  - Single assessment of patients
  - Use of formally agreed pathways, guidelines and protocols
  - Shared objectives of care by different teams, professionals and parts of the organisation
- Services designed and planned on the basis of a 'flow system' to prevent queuing and waiting for diagnosis or treatment.
- Separation of emergency and elective pathways of care.
- Single portal of entry for emergency admissions, through A & E and the Emergency Medical Complex
- Central emergency and elective operating theatres department.
- Rapid access to diagnostic services.
- Patients requiring rehabilitation will move through a care pathway defined by their needs not by their age or disability. Early access to rehabilitation will be a feature of medical and surgical pathways and will include transfer to dedicated rehabilitation facilities.
- Discharge planning will commence at the earliest opportunity including pre-assessment.
- Maximum use made of extended evening and weekend working to provide diagnostic services.
- Modern career framework with both a multi-skilled and a specialist workforce.
- On site facilities for education, research and study.
- Separation of staff and patient, public and facilities management routes.

These key themes will be central to the design and operation of the new South Glasgow Hospital and will be at the core of the required service modernisation and new ways of working.

**Scheduled Care**

The majority of scheduled care at the new South Glasgow Hospital will be undertaken on an inpatient basis. The development of unscheduled care requires the separation of programmed and un-programmed care streams with the protection of capacity in relation to key facilities such as inpatient beds, operating theatres and post-operative recovery.

Elective admissions to be screened pre-admission, especially those undergoing high-risk surgery

There will be no elective day surgery at the new hospital; therefore no day surgery facilities will be required.

There are 12 medical day care beds planned within the building.

The majority of haemo-oncology day cases and all outpatient chemotherapy for lung, cancer, breast and colorectal will be provided at the Victoria Ambulatory Care Hospital for the South Glasgow population and the West of Scotland Cancer Centre for the West Glasgow population.

The majority of day-case endoscopies and therapeutic endoscopy, will be provided at the Victoria Ambulatory Care Hospital and Gartnavel Hospital, with the exception of ERCPs, which will be carried out at the new South Glasgow Hospital.

**Unscheduled Care**

Unscheduled care services will be provided in an identified 'emergency care zone', which will house the Emergency Department, Acute Assessment and Critical Care.

It is essential for patients with a high risk of being a source of infection to others to be managed "separately" to avoid the risk of infecting other patients while in the Acute Assessment Area or an Acute Admissions Ward. This will include; influenza, Norovirus, gastroenteritis, SARS, MRSA etc. This will require isolation facilities. The Infection Control Team have been fully involved in the planning of hospital to address and reduce the risk of spread infection through the design of the facilities).

There will be an 'Emergency Medical Complex', consisting of the following four components:

- An Acute Assessment Area (AAA)
- A Protocolised Management Facility (PMF)
- An emergency outpatient clinic
- An Acute Admissions Ward (AAW)

These units will all be co-located, alongside the A & E Department, and will be the focal point of unscheduled care provision for all patients.

Although this model has been developed for emergency medicine, it will also be applied to emergency surgery and trauma.

**Diagnostics**

It is anticipated that the majority of routine diagnostic tests for patients from South and West Glasgow will be undertaken at the Victoria Ambulatory Care Hospital and Gartnavel Hospital respectively. Investigations carried out at the new South Glasgow Hospital are therefore likely to be of a specialist nature, with the exception of support provided for out-patient attendances.

Imaging services will be providing support for A&E, out-patients and in-patients. Rapid Access imaging is particularly important for A&E, critical care beds and theatres.

To achieve this, the exemplar design arranges imaging over 2 floors. On the ground floor the diagnostic facilities can easily be accessed by both out-patients and A&E while the diagnostic services located on the first floor are adjacent to critical care and theatres but can also be easily accessed by the in-patient wards in the tower block.

Haematology, biochemistry and mortuary services will be provided in the new laboratory building at the Southern site, which will be linked to the New South Hospital via an underground passage and pneumatic tubes

**Critical Care**

There will be six discrete critical care units, as follows:

- Intensive Care
- Medical High Dependency
- Surgical High Dependency
- Coronary Care

- Acute Stroke Unit
- Renal High Dependency Unit

The intensive care and high dependency units will be located together. The only exception to this is renal HDU which will be located within the renal unit with close access to both the critical care zone and the theatres department.

The Coronary Care Unit will be in close location to the critical care beds.

The Acute Stroke Unit will be designated and managed as a high dependency unit.

**Theatres**

The theatre department will consist of 20 theatres with appropriate designation and separation of elective and emergency theatres.

**Rehabilitation**

There are 179 rehabilitation beds within the new South Glasgow Hospital.

In addition to the Rehabilitation beds in the new build, some beds will be provided in the Langlands Building.

Amputee patients may have up to 6 weeks lengths of stay. On average after 2 weeks these patients no longer require an acute hospital environment. It is therefore planned to transfer amputee patients who are 2 weeks post operation, to a step down facility at the Westmarc facility which provides the patient's daily physiotherapy. The 22 beds will provide a less clinical, more appropriate environment for patients while they recover. The Westmarc Centre will continue to provide limb fitting, wheelchair provision and the regional prosthesis and orthotic service.

The School of Podiatry at Govan Road entrance to the site, will continue to provide the podiatry service for South Glasgow.

Therapy areas will be located alongside the rehabilitation beds, in order to enhance service integration.

The exemplar design of the hospitals has been developed in liaison with a wide range of user groups and the Community Engagement Team has undertaken a comprehensive programme of consultation with patients and carers, patient groups such as 'Better Access To Health', and local community organisations.

## 5.7 PROJECT OBJECTIVES

The need to modernise patient care, speed up the patient journey, make more effective use of clinical time and to ensure patients are seen by the specialist team are at the core of the service redesign and changes within NHS Greater Glasgow and Clyde.

The fundamental aim of this project is to provide modern state of the art facilities that will deliver the redesigned patient pathways which streamline patient care, delivering improved efficiency and more effective service models, as we implement the Acute Services Strategy for Glasgow and Clyde. This will ensure that Glasgow's Hospitals are providing the best level of patient care to the highest standard, which is as good as any to be found throughout Europe.

The key objectives to achieving this are:

- Provision of local access to core medical and surgical services and consolidated specialist and tertiary services that ensure patients all get access to the appropriate level of specialist services they require.

- Bringing together clinical teams to concentrate clinical expertise that will support meeting the European Working Time Directive and Modernising Medical Careers and will create sustainable expert teams. This will ensure 24 /7 access for patients to specialist care

- To make the best use of the workforce and reduce the number of on-call rotas across the city;
- Provision of modernised accommodation and improved facilities which meet the needs of patients, visitors and staff and are appropriate to the provision of modern health services, promoting a healing environment and improved patient access;
- Increased clinical capacity, improving access to services including diagnostics and reducing waiting times for treatment;
- Improved efficiency by separating elective from emergency care where possible, so routine elective work is not interrupted by the calls of emergencies arriving in the Hospital or arising on the wards;
- Uniform access for routine services across Glasgow;
- Provision of highly specialised services provided by skilled staff facilitated through the centralisation of specialties and through improved retention and recruitment due to a radically better working environment.
- Enhanced University links through co-location of an academic centre with the new hospitals on the Southern General Campus. This will enhance teaching, and research and play a significant role in attracting and retaining high quality staff in all disciplines

The overall aim is to provide a hospital service that offers the most up-to-date treatment quickly using specialist skills in settings that are modern, friendly and convenient. The facilities must be readily adaptable to changing clinical practice as the future unfolds, and allow related diagnostic and treatment to be close to each other.

The new builds will provide a catalyst for:-

- New ways of working and so improved patient services with effective clinical adjacencies;
- Increased flexibility to changing demand for services;
- Facilitating the development of new staffing arrangements that closely reflect national best practice;
- Facilitating the development of the hospital site and services in a manner which enhances departmental and functional relationships.
- Creating capacity in the right place with the appropriate co-locations to deliver the challenges of all the targets and imperatives of health policy, “Better Health, Better Care”.

## 5.8 BENEFITS

The benefits expected from this project are listed below:

| Objective | Benefit |
|---|---|
| **Strategic Fit -Consolidation of Services** | • Acute Adult Inpatient services consolidated onto 3 sites<br>• Specialisation and sub- specialisation models supported 24/7 with specialist cover<br>• Focuses specialist/ experienced staff in fewer sites supporting delivery of most effective care<br>• Achieve new directives e.g. Modernising Medical Careers.<br>• Reduce the number of medical rotas.<br>• Improved co-location of services to support unscheduled care including A&E, Theatres, Critical Care and Imaging<br>• Maximises use of dedicated facilities such as trauma theatres<br>• Optimises use of resources |
| **Clinical Quality** | • Improved occupancy reducing the clinical risks / delays in patient care due to boarding patients out with specialty<br>• Improved Hospital Acquired Infection rates due to single room facilities and improved space within facilities<br>• Appropriate levels of specialist staff to provide and sustain clinical services with 24/7 access to specialist services<br>• Specialist teams working together supporting redesigned services to allow new techniques to be used and developed<br>• New service models supporting the reduction in unnecessary admissions<br>• Patient Safety Initiative input to designing safety issues out of new facilities and models of service<br>• Improved utilisation of facilities as purpose built with improved co-locations<br>• *Full Benefits Realisation plan to be developed as part of Clinical Transition to identify specific key performance indicators.* |
| ***Performance Improvement in Patient Services*** | • Facilities that support improved ways of working, creating more effective patient pathways to provide timely and fit for purpose unscheduled care<br>• Improved capacity created and waiting time guarantees met within GGC facilities<br>• Facilities that support achievement of the balance between Unscheduled and planned care pathways to safeguard targets being met<br>• Appropriate bed numbers by specialty that support improved occupancy levels eliminating the requirements to board patients out with the specialty caring for patient<br>• Number of one-stop clinics increased. – Reducing unnecessary follow-up appointments.<br>• Throughput of patients increased to support earlier access to treatment |
| **Quality Environment** (Meeting patient, visitors and staff needs) | • State of Art new buildings<br>• Better environment for patients and staff – purpose built facilities supporting effective patient pathways and enhancing |

| | |
|---|---|
| | the quality of patient experience<br>• Stimulating buildings through art and design<br>• 100% Single room provision, reduced hospital acquired infection.<br>• Increased opportunity for patients and the public to be involved in decisions around patient services and design of facilities<br>• Targets for carbon emissions and energy consumption met |
| **Information Management and Technology** | • Improved access to patient information electronically supporting increased continuity of patient care<br>• New systems supporting paper light services |
| **Staff Facilities and Motivation** | • Purpose built facilities<br>• Modern amenities<br>• Support recruitment and retention<br>• Increased opportunity for staff to be involved in decisions around patient services and design of facilities |
| **Accessibility to Hospital and Compliance with Travel Plan** | • Better co-location of services reducing patient transport within hospital<br>• Easy transport links to support both patient and visitors attending the hospital<br>• Improved cycling and walking routes |
| **Enhanced Links with University** | • University academic centre co-located with acute services on the southern General campus<br>• Improved recruitment and retention<br>• Consolidated services better supporting the training of junior staff |

# 6. DESCRIPTION OF OPTIONS

## 6.1 BACKGROUND TO THE APPRAISAL PROCESS AND FORMAT OF THIS CHAPTER

The option appraisal considered the magnitude of service and physical change being planned. Given the scale and complexity of the project there were only two options that could cope with a development this size. In 2006, this became even more relevant when agreement was reached to build the children's Hospital on an acute site within Glasgow. The two options were as follows. The first option was to build a 1900 bedded new hospital facility on a Greenfield site (this includes replacing the Neurosciences, the Spinal Unit, Maternity and Langlands buildings. The second option was to construct a new 1349 bedded facility (1109 adult beds and 240 children's beds) on the southern site which allows the retention of the Neurosciences, the Spinal Unit, Maternity and Langlands buildings in the current retained state.

While the Greenfield option had the potential to offer good benefits in terms of achieving excellent clinical adjacencies it was an extremely high cost option and therefore considered unaffordable.

The new build option on the new southern site therefore became the preferred option allowing reuse of existing estate.

Continuing with the appraisal process to build a new children's and adult hospital on the southern campus two further elements were appraised to determine the best design configuration. These were:

a) to build separate or integrated hospitals
b) to identify the optimal building shape to achieve the critical clinical co-locations, future expansion space and links into Maternity and Neurosciences. Potential building shapes fell along a spectrum ranging from tall thin to low and flat

A tall thin integrated building was identified as the preferred option. This option was further adapted to enhance the clinical adjacencies and from this an exemplar design was developed.

The capex cost of the new adult and children's Hospital is based upon this exemplar design.

Two sub-options were developed around the preferred option. These are option 1 which incorporates new builds for a 17,000 $m^2$ laboratory facility and for clinical support and other services. The second sub-option, Option 1a, makes better use of the existing estate and provides a smaller 5,200$m^2$ laboratory build.

A benefits appraisal of the two sub-options was undertaken.

The final part of the option appraisal process was to determine the option (Greenfield, Option 1 or 1a) offering the best Value for Money and, from this the best method of purchasing the preferred option.

The results of the financial appraisal is given in Chapter 9. This chapter describes the site and design option appraisals and is laid out in the following sections.

6.2 The review of an option to build the new hospitals on a Greenfield site in the South of Glasgow;
6.3 The key criteria considered in positioning the new hospitals on the Southern site;
6.4 The factors considered in deciding whether to build the hospitals as separate buildings or an integrated facility;
6.5 The preferred design configuration for an integrated facility;

6.6 The development of the exemplar design;
6.7 Design quality;
6.8 Future proofing;
6.9 Sustainability and energy conservation;
6.10 Options for delivering the New South Glasgow and Children's Hospitals and associated works on the Southern Site
6.11 Benefits appraisal

## 6.2 GREENFIELD SITE – (RE-PROVISION OF SOUTHERN GENERAL HOSPITAL SERVICES ON ANOTHER GLASGOW SITE)

As described above, Phase 2 of the Acute Services Review involves the development of a new adult and new children's hospital at the Southern General site. The New Children's Hospital site has already been determined through the work carried out by the Calder Group in 2006 who identified the Southern General site as the preferred option. An option appraisal process was carried out in 2002 for the New Adult Hospital, the Southern General site was chosen as the preferred site compared to another site within Glasgow (a Greenfield site located at Cowglen).

It should be noted however that, for the purposes of comparison for the Outline Business Case, the option of building the New Hospitals on a Greenfield site was also revisited. The option to build on a Greenfield site was first explored in 2002 and dismissed by the Health Board because of cost, (Reference Health Board Paper, 18th January 2002).

The Greenfield would involve the construction of the new adult and children's hospital at a Greenfield site located in the south of the city. However as the planned retained services cannot be left in isolation these would also have to be transferred to the Greenfield site. This represents approximately 630 beds which currently constitute the Institute of Neurological Sciences, Maternity and Spinal Injuries and Langlands buildings.

There would also be a need to relocate smaller capital works associated with the new hospitals such as a new build clinical support block, new laboratory build, a facility for post acute amputees and two multi-storey carparks.

The Greenfield site option would therefore involve new build of approx 1900 beds and comprehensive support services along with considerable investment in transport infrastructure required by the city planning.

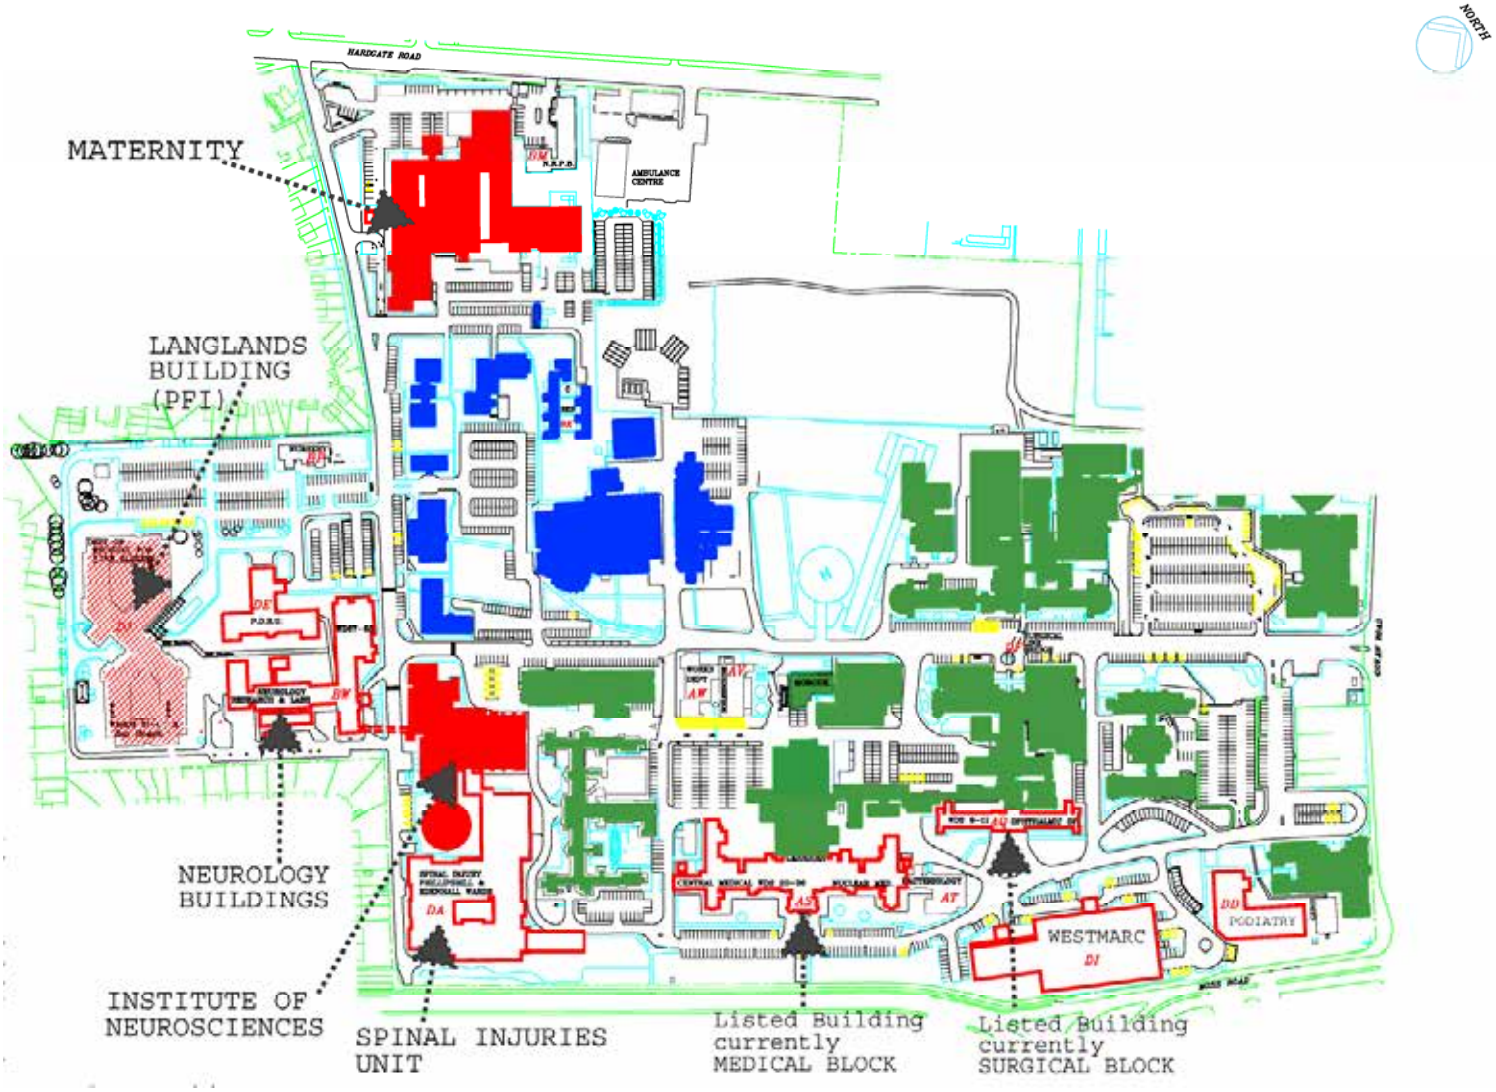
An area of land approximately 20 hectares (49.5 acres), with good road and public transport links would need to be identified and purchased. When the Greenfield option was first explored in 2002 the land identified at that point was the Cowglen area of Glasgow, this is no longer available.

In reviewing this option the capital cost has been developed on the basis of the new hospital build costs and a pro-rata calculation of the cost of replacing the retained estate. The estimated cost of the Greenfield option is £1.8 billion. This excludes land purchase on the Greenfield site and land sale of the Southern General Hospital. It is estimated that it will cost £6 million more to buy the Greenfield land than for the sale of the Southern site. However the £1.8 billion cost also excludes the development of road infrastructure and public transport network to and from the site, which would need to be capable of carrying 725,000 patients plus their visitors and 10,000 staff, and meet other planning conditions and Section 75 agreements.

The economic appraisal of this option is given in Section 9.

## 6.3 POSITION OF THE NEW HOSPITALS ON THE SOUTHERN SITE

One of the key criteria in considering the site of the new hospitals on the southern site is the need to physically link the new adult and new children's hospitals into both the maternity and neurosciences buildings to allow ready access to a full range of paediatric services for both foetus in utero and new born babies, and to enable pregnant mothers access to critical care and other acute services. The link between Neurosciences Building and the New South Glasgow Hospital will also allow rapid access for staff between both buildings, in particular the two critical care units



The Neurosciences and Maternity buildings are blocked in red and can be seen situated at the top and bottom of the plan.

All the buildings marked in red will remain on the site long term. These include, amongst others, the aforementioned Maternity building and Institute of Neurosciences, the Spinal Injuries Unit, Neurology buildings, the front section of the Medical and Surgical Block and the Langlands building. These buildings are either relatively modern, subject to extensive refurbishment or are listed. The Langlands building is a 240 bedded PFI building completed in 2001 which houses care of the elderly beds, young physically disabled and dermatology.

The buildings marked in blue are within the site designated for the New Adult and Children's Hospitals and the New Laboratory build. This site will allow the new hospitals to achieve the links into the neurosciences and maternity buildings.

There is a comprehensive plan to re-locate all the services within the blue buildings to other locations to allow demolition and clearance of the site by 2010, more detail can be found in Appendix 7.

The buildings marked in green house patient services which will transfer the New South Hospital upon completion.

## 6.4 BUILD OPTIONS FOR THE NEW HOSPITALS – SEPARATE BUILDINGS OR INTEGRATED BUILDINGS?

An option appraisal was undertaken looking at a number of scenarios amongst them being an option to build the hospitals separately or as an integrated building. The benefits, risk, costs and deliverability were explored. The preferred option identified was an integrated build to capitalise upon: the clinical synergies around A&E and radiology; the lower risk of fewer contractors on site; decreased complexity of interface issues between the two buildings with better patient flows and streamlining of processes; better deliverability and lower build and running costs due to operational synergies.

## 6.5 PREFERRED DESIGN CONFIGURATION OF THE INTEGRATED BUILDING

This section details the key criteria of the design brief, desired clinical adjacencies, design configuration, option appraisal and preferred option.

### 6.5.1 Design Brief and Design Option Appraisal

**a) Design Brief**

As discussed in the previous section the preferred option is an integrated build for the Children and Adult hospital. In developing the exemplar design several key criteria were considered, these were as follows:-

- the critical clinical co-locations required within the new building
- the need to maintain distinct and separate identities for both hospitals through separate public entrances and distinct public faces
- the desirability of minimal travel times throughout the hospital
- linkage into the new laboratory build
- the requirements to link the new hospitals with the existing neurosciences and maternity buildings which sit at opposite ends of the site
- the need to maintain existing hospital services during construction of the new development
- desirability of future expansion space on the campus
- impact of the new build upon surrounding neighbours (residences to the south of the site)

**b) Design Option Appraisal**

A range of five options were developed in response to the design brief outlined above. A high level appraisal involving technical advisors and NHS Stakeholders resulted in a de-selection of two options which did not meet the full design requirements.

The remaining three designs did meet the full brief. In addition all 3 options:

- facilitate the Board's preferred phasing strategy that allows the Adult and Children's hospital and labs to be built in one continuous operation.
- place the New Children's hospital on the west of the site where it can link to both the existing maternity block and the New Adult Acute hospital to create the "Triple Gold Standard" of clinical care.
- provide a first floor link to the existing theatres and critical care areas in the Neurosciences Block.
- allow for the new Fastlink services to pass through the site entering from Govan Road and exiting via new entrance onto Hardgate Road.
- have a common location for the new laboratory facility and FM block in the northwest corner site.

An option appraisal was undertaken involving the design team, technical advisers, and NHS stakeholders.

The weighted criteria against which the options were scored included:-

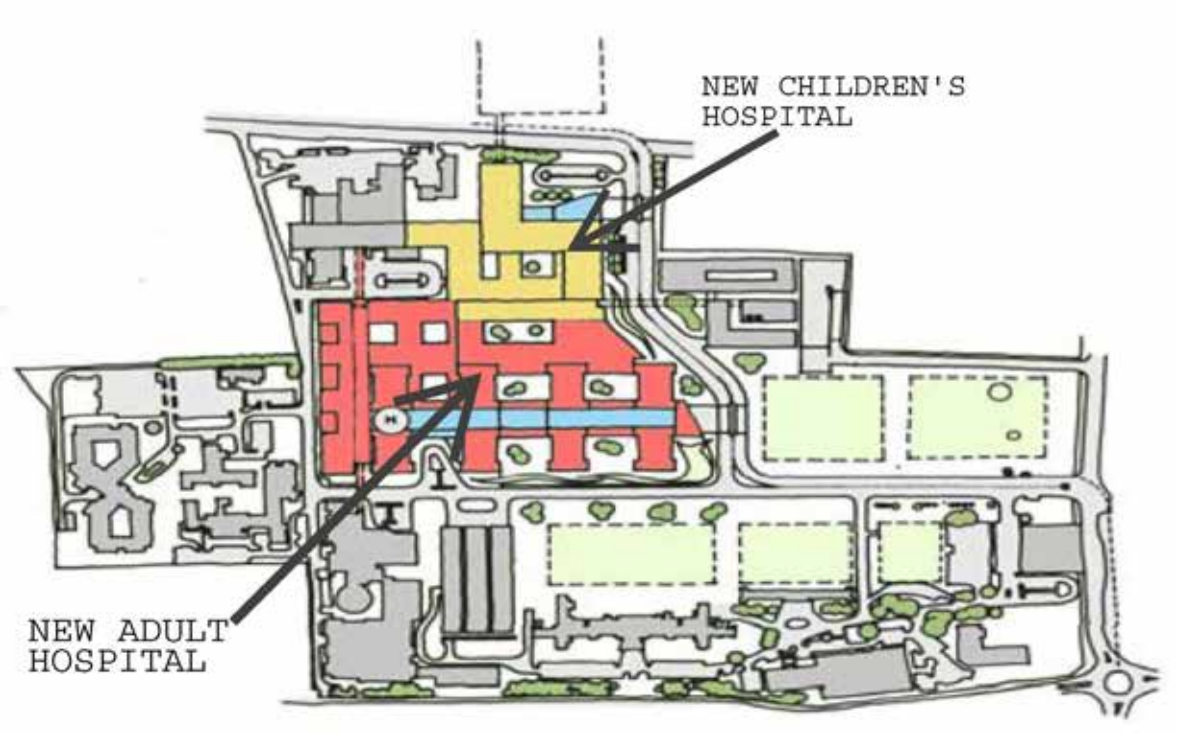
- access
- achievement of departmental adjacencies including journey times
- Flexibility and future expansion abilities
- External environment *(e.g. impact upon residencies, separate identities for children and adults hospital, landscape opportunities)*
- Internal environment *(e.g. views out of building for patient, public and staff; ease of way-finding; clear segregation of visitors, patients; and Facilities Management circulation)*
- Deliverability

The following section describes the options and the results of the option appraisal.

**6.5.2 Description of the 3 Options**

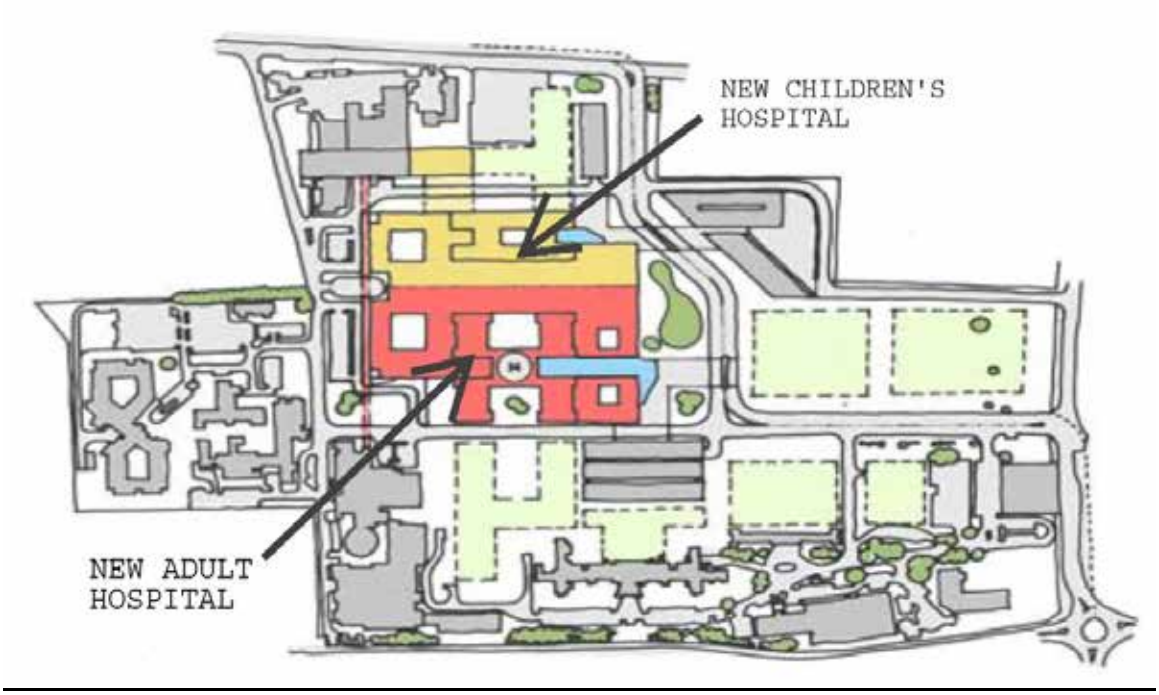
The three options are shown below along with a description of each. In brief they lie along a spectrum ranging from a lower flatter building with 8 floors to a progressively taller, thinner building shape with 14 floors.

Option A: lower, flatter style building - This option requires the largest ground floor foot print. It proposes an adult acute block containing the emergency department (ED), theatres and critical care beds at the southern end linking the existing neuro and maternity buildings. An 8 storey block with 8 adult wards per floor engages with the acute block on the east side. The children's hospital sits to the west and assumes inclusion of the Scottish Ambulance Service (SAS) site to provide sufficient site and direct frontage onto Hardgate Road.



Option B (Shown below) This option represents the middle option and arranges the general wards above the acute facilities containing the Emergency Department, theatres and critical care beds. This results in a 10 storey built form with 6 adult wards per floor.

Option C: This option represents the tallest option but in doing so places the height element further into the middle of the site. As with Option B, the wards sit above the acute facilities but the reduction to 4 wards per floor reduces the impact of the taller element on facilities below. This results in a 14 storey structure concentrated in the centre of the site.



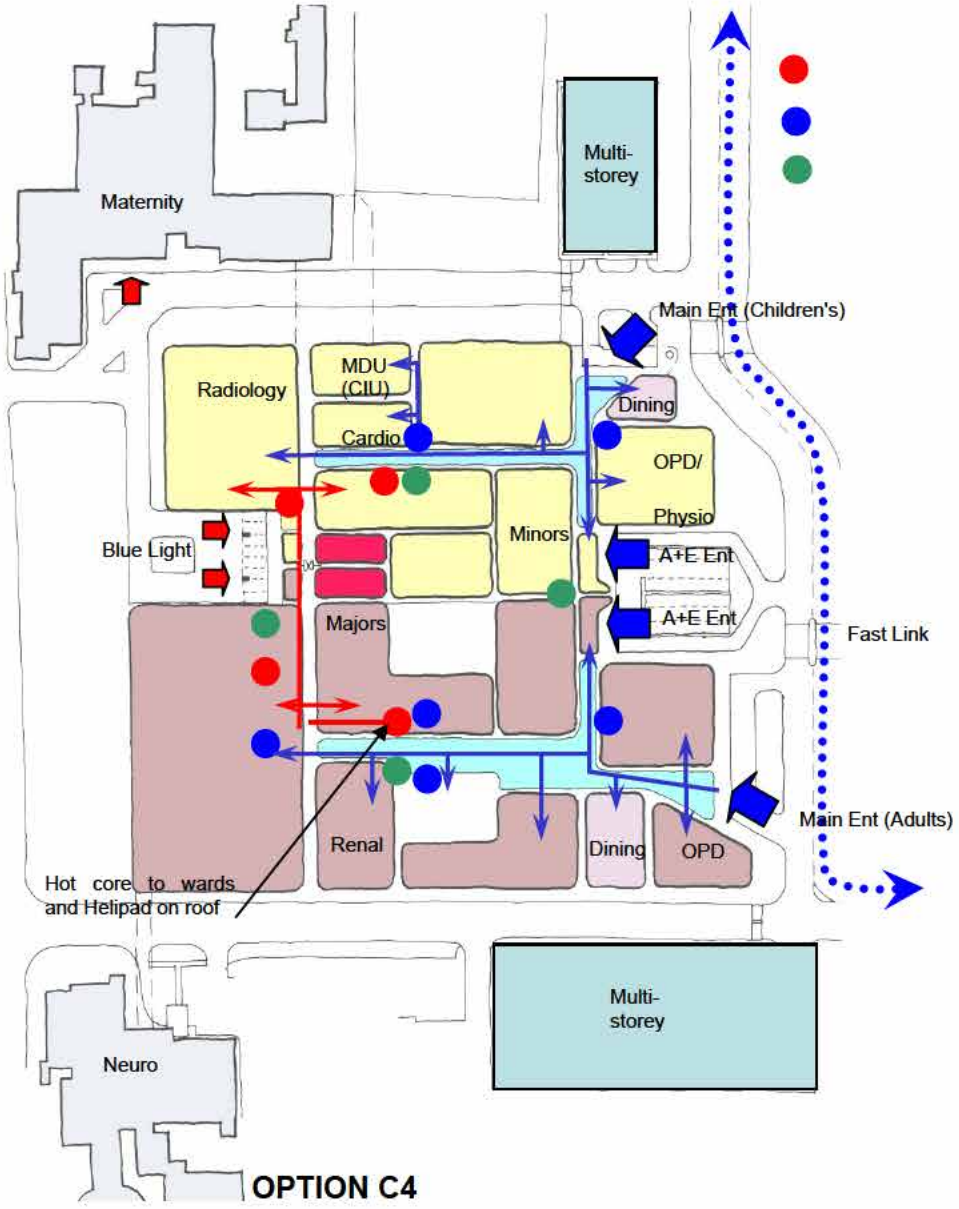
### 6.5.3 Results of the Design Appraisal Process

The appraisal process identified Option C, the tall thin building as being the preferred configuration as it was most able to meet the above criteria. The results can be found in appendix 8.

In more detail Option C facilitates the desired co-locations, the vertical structure reduces travel time to less than 4 minutes between the furthest points in the building (Option A has a calculated travel time of 17 minutes between the furthest points in the building). Finally, although the building is much taller, because it has a smaller foot print, it allows for expansion space and does not over shadow residential neighbours (along the southern boundary) as the build can be placed more centrally on the site than a low flat building.

Further work took place looking at alternative arrangements within the preferred Option C configuration. This was in response to concerns expressed by users at the previous appraisal with regard to the positioning of entrances, and in particular the locations of the adult's and children's public Emergency (walk in) entrances. Four variants were shown to a smaller Board group which concluded that Option C4 should be developed as a preferred option. This option offered separate and distinct entrances to both hospitals, it offered a shared blue light entrance and it gave separate ambulatory entrances to the A&E departments of both hospitals, however, these were co-located in the event that if a user presented at the wrong entrance they can be redirected very quickly without jeopardising patient care.

Option C4 is shown below



**ADJACENCY DIAGRAM**

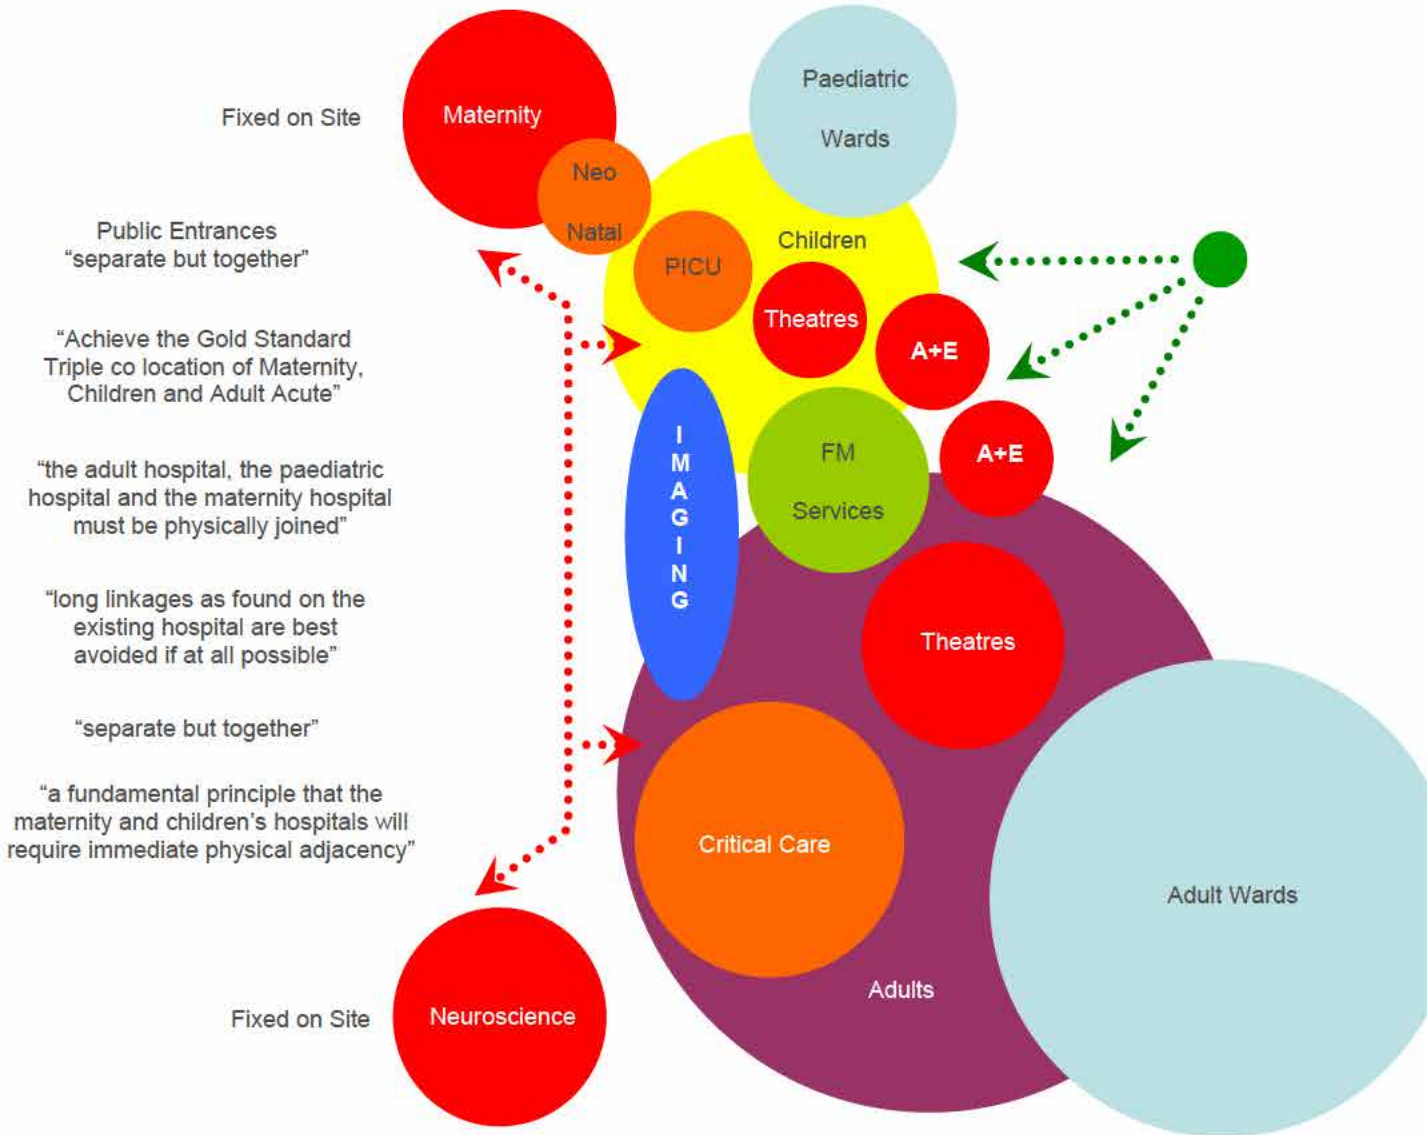
## 6.6 EXEMPLAR DESIGN

An exemplar design based on option C4 has been prepared by the Board to test the project brief and provide a benchmark for Outline Business Case costing. The capex cost for the new adult and children's hospital is based upon the exemplar design. 1:500 layouts have been designed for all hospital areas and 10 key departments (5 in the new Children's Hospital and 5 in the new Adult Hospital) have been developed further to 1:200 designs, these are contained in appendices 9, 10 and 11. The key departments are A&E, Radiology, Wards, Critical Care and Public Concourse/Entrance for each hospital. The PSC also provides future development partners with a Design Exemplar when preparing their own detailed proposals.

In developing the exemplar design one of the key aspects considered was the critical clinical adjacencies. The section below describes these in more detail.

The critical clinical co-locators are shown in figure 1 and described below.

**Figure 1 – Visual Representation of the Physical Adjacencies**



One of the areas identified for potential clinical synergies between the adult and children's hospital is Accident and Emergency. Therefore, the two A&E departments are required to be side by side. The A&E departments need ready access to diagnostics, theatres, critical care and acute assessment.

The maternity building must be linked to the children's new build to allow ready access to a full range of paediatric services for both foetus in utero and new born babies. The maternity building must also be linked to the new adult hospital to allow pregnant mothers access to critical care and other acute services.

There must be a link between the Critical Care in the Neurosciences building to Critical Care in the New South building to allow staff rapid access between both units.

Another key co-location is the labour suite and obstetrics theatres to the neonatal unit which, in turn, needs to be co-located with the paediatric intensive care unit. Paediatric and Intensive Care must be close to the theatres and radiology. These clinical co-locators set the parameters for the development of a 1:500 departmental relationship drawings of the new hospitals.

## 6.7 DESIGN QUALITY

There has been concern that many design solutions for public buildings were previously not of a sufficient high quality to meet hospital and public aspirations. Much work has been undertaken on design visioning, such that quality aspirations can be successfully built into the output specifications and objectively assessed when bids are being compared.

In line with HDL 58 'A Policy on Design Quality for NHS Scotland' published in 2006 the Board appointed two Design Champions and approved a Design Action Plan in October 2007. The Design Action Plan reinforces the Board's commitment to achieving high quality design which promotes good well-being environment within the New Children, Adult hospitals and new labs build. This aspiration applies to both the internal and external environment of the buildings through the use of good design, light, colour, building materials and landscaping with user needs a priority. User needs have been identified through a programme of meetings with clinical sub-groups for each hospital overseen by a Clinical Advisory Board and a series of focus groups held with patient and carer groups representatives (for more detail see section 17).

It is the Board's wish to deliver an iconic development that will contribute positively to the local context and be viewed with pride by the people of Glasgow.

## 6.8 FUTURE PROOFING

In designing the new hospitals the Board will take into account the need to future proof the buildings, for example, the consideration of the potential inclusion of 100% single rooms, the positioning of 'soft spaces' throughout the building and location of the diagnostic department to the outside of the building, adjacent to land which could be utilised for future expansion should it be necessary

The clinical areas of the hospital are likely to change more quickly and radically than any other area as new technology is developed and advanced treatment methods become available. To allow future flexibility it is proposed that the hospital services infrastructure is distributed in a well structured way, based on risers in vertical transport areas, adjacent to lift and stair areas. This should minimise any disruption due to internal reconfiguration of hospital departments.

## 6.9 SUSTAINABILITY AND ENERGY CONSERVATION

### 6.9.1 Sustainability

In developing the new hospitals the Board will promote economic, social and environmental sustainability, for example, increasing energy efficiency, maintaining biodiversity and encouraging green travel through walking, cycling and public transport. Also action will be taken to minimise noise and dust as much as possible during construction.

### 6.9.2 European Trading Emissions Scheme (ETS)

The New South Glasgow and new Children's Hospitals development will not be complete until 2014 and therefore is likely to fall under Phase 3 of the ETS, details of which are not yet agreed. The project will be reviewed in the light of these once available.

### 6.9.3 Carbon Trust and Waste and Resources Action Programme

The Board are working with the Carbon Trust to increase energy efficiency of the new hospital building design. The Board are also working with Waste and Resources Action Programme (WRAP) to enable more efficiency in use of building materials for the new hospitals and recycling (minimising landfill, reducing carbon emissions and improving the environment.

### 6.9.4 Energy Targets and Use

NHS Guidelines are that Energy use should be within range of 35-55GJpa per 100cm.

The view has been taken that the new hospitals Design Solution should at least meet the NHS and Building Regulation standards with regard to energy use current at the time the buildings are built or that are economically and technically viable to include.

The design priority is to invest in the highest quality building fabric and envelope design to reduce the demand for energy to the lowest economically possible level as these have, in general, the lowest technical risk associated with them and are often the least easy to substantially change over the building life. The energy systems within the buildings have a much shorter life, are easier to adapt and will be regularly replaced and upgraded over time based on their own life cycle and the changing technical, economic, regulatory and social pressures at the time of replacement. The building infrastructure is to be arranged to facilitate as far as is possible the likely changes that will be made.

A target of 55GJpa per 100cm at completion is proposed for the new adult and children's hospitals.

### 6.9.5 On Site Renewable Energy Targets

Currently neither Section 6 of the Scottish Building Regulations or Glasgow Planning Guidance require low or zero carbon (LZC) systems to be included with the building design.

It is likely that Glasgow Planning Guidance will require up to 20% Low or Zero Carbon (LZC) energy systems to be included within the scheme before the hospitals are built. It is likely that the development will require 20% of the total energy supply to the hospital to be from LZC systems.

A central energy centre with centralised boilers and electrical supply will provide a distribution infrastructure which is adaptable to future technologies and opportunities. The fuel source can be changed relatively easily as new technology becomes resilient and economic.

### 6.9.6 NHS Environmental Assessment Tool

NEAT (NHS Environmental Assessment Tool) has been used to identify the environmental impact created during day-to-day operational activities. Buildings assessed using NEAT are rated as excellent or very good. The exemplar design for the New Adult and Children's Hospital includes measures required to achieve an excellent rating. The design will invest in quality building fabric to reduce the demand for energy to the lowest economically possible.

### 6.9.7 Architecture And Design Scotland (A&DS)

The Board is working with A&DS to improve both the design quality of the new facility and the impact on the environment through better and more appropriate design. NHSGG&C have entered into an agreement with A&DS to provide enabling support to the project to assist in securing the optimum level of design quality.

### 6.9.8 Renewable Energies

The Board is also exploring the use of renewable energies as possible options for inclusion in the new build, for example, wind turbines, solar and thermal energy and bio-mass fuelling.

## 6.10 OPTIONS FOR DELIVERING THE NEW SOUTH GLASGOW AND CHILDREN'S HOSPITALS AND ASSOCIATED DEVELOPMENTS ON THE SOUTHERN SITE

For the purposes of the Outline Business Case two options around the Southern General site have been developed, these are Option 1 and Option 1a. Option 1 has a higher percentage of new build for the associated developments and Option 1a utilises more of the existing estate.

The section below describes each option in detail.

### 6.10.1 Option 1

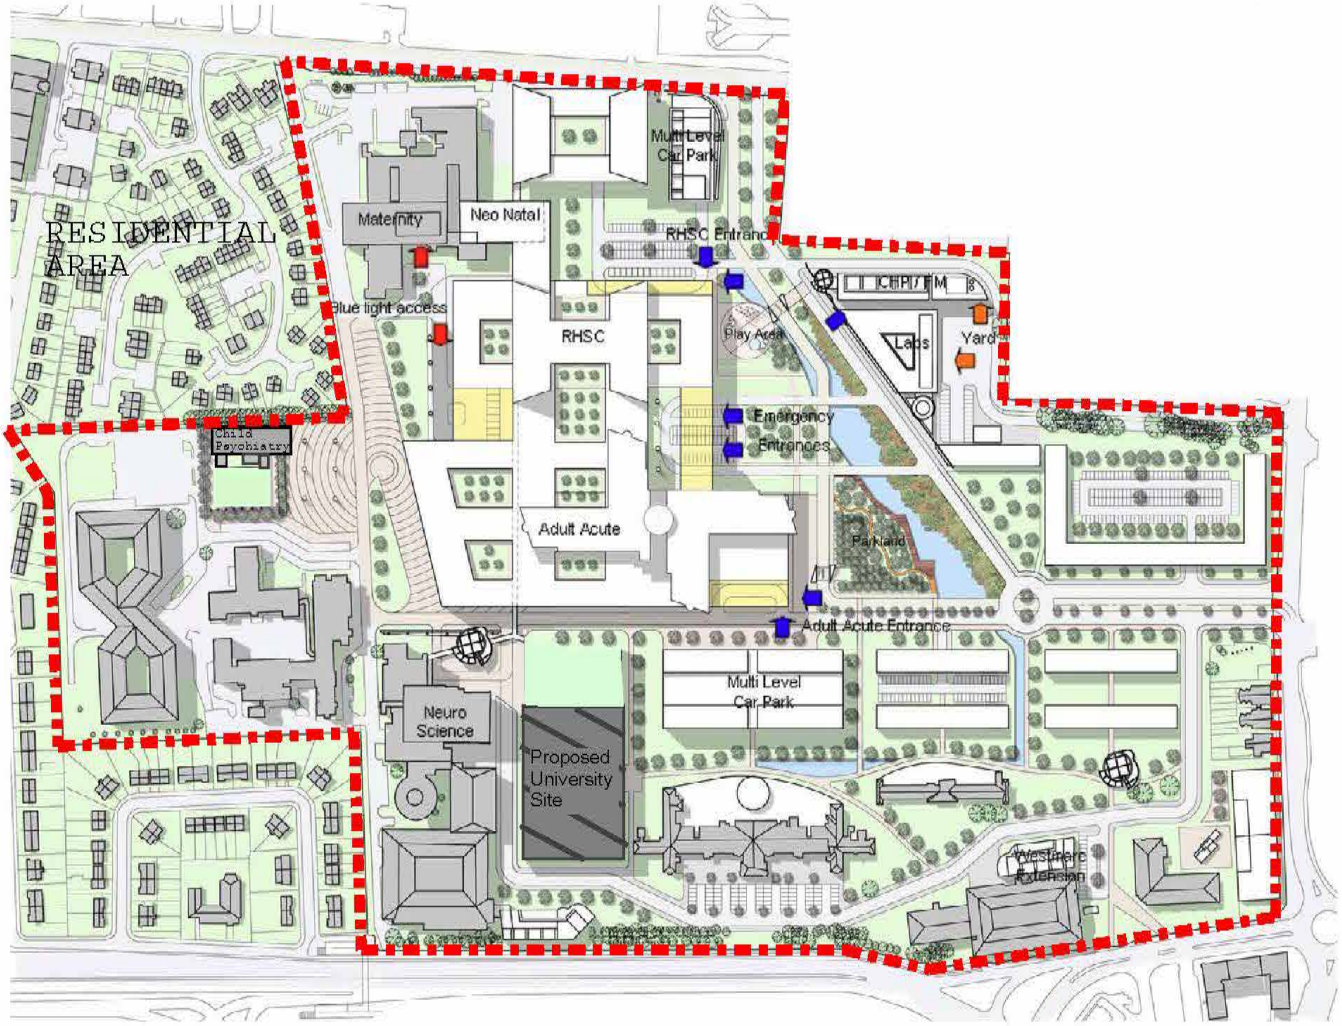
Option 1 consists of an adult and children's hospital integrated within a single building to capitalise upon the clinical and facilities management synergies. The building will physically link into both the maternity and neurosciences buildings.

A new 17,000m$^2$ purpose built, multi-disciplinary laboratory facility is also planned. This will link into the new hospitals via an underground link and pneumatic tubes.

There are a series of smaller capital works associated with the new hospitals these are as follows :- a number of enabling works, development of two new multi-storey car parks, a new build facility for clinical support services (such as offices, facilities management and clinical administration), and a new 22 bedded extension onto the Westmarc rehabilitation centre for post acute amputee patients.

It should be noted that Glasgow University have plans for a new build academic centre near the new hospital development and an area of land on the Southern Campus has been identified by the Health Board for this purpose.

An illustration of how the southern site will look under Option 1 is given below.



The following section describes Option 1a.

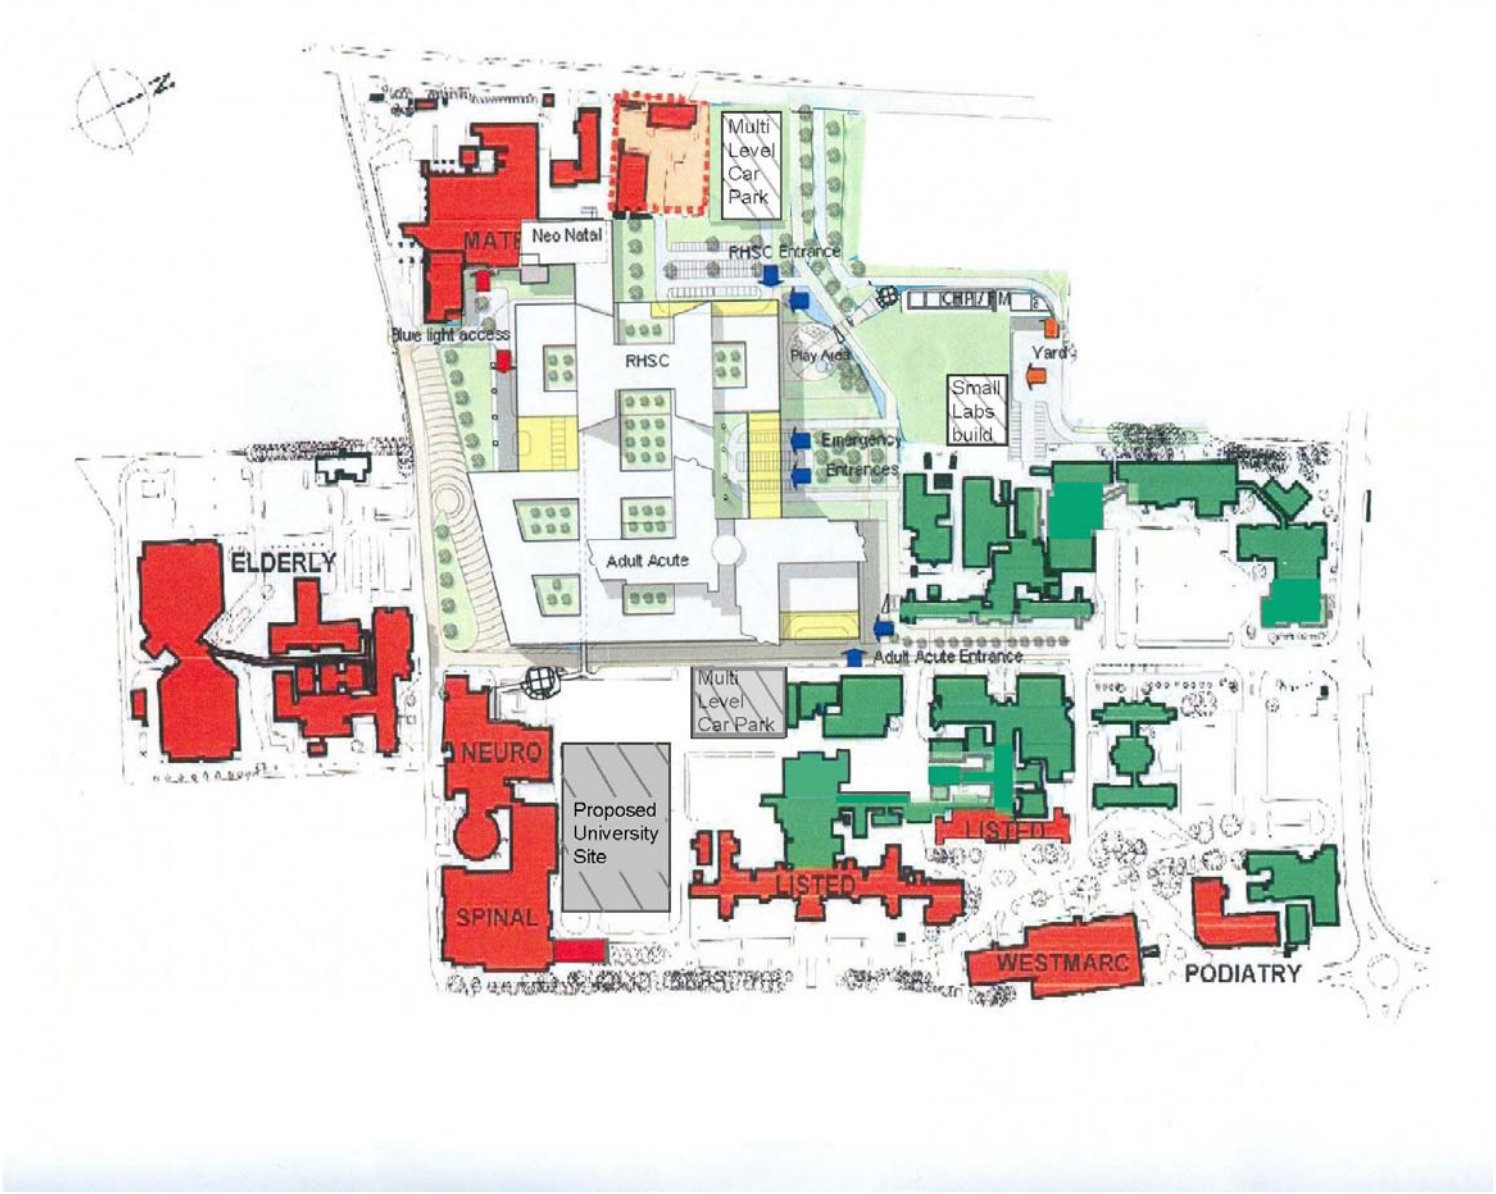
### 6.10.2 Option 1a

Option 1a consists of the planned integrated adult and children's hospital as described above. In this option however those associated works for which new builds were planned will now be incorporated into the existing estate.

In other words the green buildings shown in the plan above, which under Option 1 will be demolished will, under Option 1a be retained and reused.

In brief, the services which will be re-housed in the existing estate include, the 22 beds for post acute amputee patients and the facilities for clinical support (e.g. training, offices) and part of the laboratory services. There are plans for a smaller labs 5,200m$^2$ build housing haematology, biochemistry and the mortuary services. This will link into the new hospitals via an underground link and pneumatic tubes.

The diagram below illustrates the southern site under Option 1a.



## 6.11 BENEFITS APPRAISAL

The benefits criteria were derived from the project objectives. The criteria were weighted and scored against each of the options. This produced scores in a very tight band, those options involving an increased percentage in new build producing slightly higher scoring. Detailed results can be found in appendix 18.

# 7. NEW LABORATORY BUILD

A Glasgow wide Laboratory Services Strategic Review was established to advise on the optimum model for the provision of laboratory services, taking into account the clinical linkages between the laboratories, the main clinical specialties and the services which require to be provided to support the clinical services profile on each site.

The key objectives of the laboratory services review process were determined as follows:

- To define and develop an agreed configuration of provision of lab services across the city which reflects the ASR strategy – consolidating from six to two major emergency and in-patient acute sites at GRI and SGH, an elective inpatient site including the regional cancer centre at GGH, new Ambulatory Care Hospitals at Stobhill and the Victoria Infirmary, and the co-location of paediatric with obstetrics on an adult site.

- To modernise the provision of laboratory services.

- To create a network of laboratory services working Pan-Glasgow, operating within a single integrated management structure.

The working principles that underpinned the review focussed on a whole systems approach to the modernisation and reconfiguration of laboratory services, with a decision-making process that reflected clinical consensus and strong partnership working

## 7.1 SUMMARY OF THE SHORTLISTED OPTIONS

The summary of the short listed options are illustrated in table 9 below.

Table 9

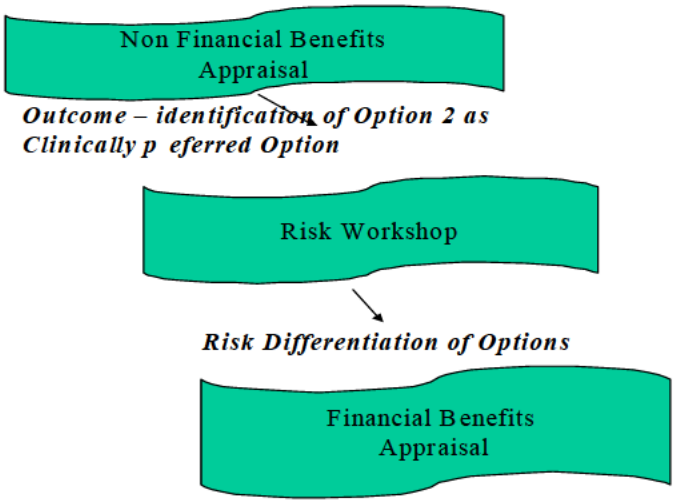
| Option | Description |
|---|---|
| Option 1 | Minimum Change: Laboratories on all acute sites, reconfigured in line with Acute Services Review (ASR) only |
| Option 2* | Laboratories on all acute sites, with significant reconfiguration |
| Option 3* | Laboratories at Glasgow Royal Infirmary (GRI) and Southern General Hospitals |
| Option 4 | One Large Laboratory at Southern General Hospital with significant Essential Services Labs (ESL) at GRI and a small ESL at GGH to service the immediate and emergency needs of the respective sites. |

* The difference between options 2 and 3 is based on sizing and on the ultimate distribution of GP and specialist activity.

## 7.2 ECONOMIC AND FINANCIAL APPRAISAL

The Option Appraisal was a fully inclusive process, led by the then ASR Director and had a robust project structure which included chairs of Specialty Reference Groups and Working Groups supporting the review, along with representatives of the partnership forum and other key stakeholders.

The Option Appraisal process involved three main components, as illustrated in diagram 1 below.



The outcome of the non financial benefits appraisal was the identification of Option 2 as the clinically preferred option. This decision was then ratified by a Risk and Financial Benefits appraisal, which confirmed Option 2 as being the most advantageous from a clinical and financial perspective.

Description of Option 2 Configuration of Laboratory Services

The description of Option 2, Configuration of Laboratory Services is illustrated in table 10 below.

*Table 10*

| Specialty | Description of Configuration of Service |
|---|---|
| Pathology | Reduce from 4 sites to 1 – centralised near the Southern General, Rapid Results Laboratories (RRL) at ACAD and Essential Services Laboratories (ESL) at GRI & GGH |
| Biochemistry | Reduce from 6 sites to 2 main labs at SGH, GRI, with an ESL at GGH (& RRL at ACAD) |
| Haematology | Reduce from 6 sites to 2 main labs at SGH, GRI, with an ESL at GGH & RRL at ACAD. |
| Microbiology | Reduce from 5 sites to 2 main labs at SGH and GRI. In addition Virology and Mycology will be located alongside Microbiology to create the basis for joint working and some elements of cross cover. |

In addition:

- Immunology, Tissue Typing, Stem Cell lab work and all other laboratory services related to leukaemia research and Haemato-Oncology will consolidate from the WIG and GRI to one single site in the new Leukaemia Research Lab at GGH. To provide a state of the art laboratory facility on the same site as the Regional Cancer Centre and SNBTS.

- The Paediatric labs at Yorkhill including Genetics will co-locate with adult laboratory services onto the new South Glasgow Hospital Campus.

A key part of Option 2 is the construction of a 5,200m$^2$ purpose built laboratory building at the Southern General hospital site for the provision of Biochemistry, Haematology, blood Transfusion and mortuary services incorporating the City Mortuary on behalf of Strathclyde Police and the Crown Office Procurator Fiscal Service. The cost of this development forms part of this business case.

Further detail regarding the New Laboratory Build can be viewed in Appendix 12.

# 8. RISK MANAGEMENT STRATEGY

## 8.1 INTRODUCTION

A risk is defined as an event which affects the cost, quality or completion time of a project that may or may not occur. There are a number of such events that could arise during the design, construction, commissioning and operation of the new facilities to be built.

There are two core principles that should govern risk transfer in building projects:

- Risk should be allocated to whoever is best able to manage and control it
- The aim is to secure optimal risk transfer (optimal risk transfer is not maximum risk transfer)

**Risk analysis objectives are to:**

***Allow the Board to understand the project risks and put in place mitigation measures to manage those risks.***

In order to fulfil this objective the project team has established a risk register in order to identify and mitigate any or all project risks and developed a risk management plan.

***Assess the likely total cost to the public sector of the investment option(s) under consideration and to demonstrate value for money***

The estimate of capital cost to complete the works required to achieve the construction objectives are assessed through utilisation of the optimism bias process to enable non attributable risks to be accounted for within the costs and programme plan.

Risks are assessed and reduced to ensure that the CPAM can be compared with a PFI option on a like for like basis ensuring that the value of risk retained by the Board under both options is understood (see Chapters 9 and 10).

***To ensure that the risk allocation is adequately considered, i.e. arriving at selected procurement strategy.***

# 9. FINANCIAL APPRAISAL

## 9.1 VALUE FOR MONEY EVALUATION

### 9.1.1. Introduction

The quantitative assessment which is contained within Section 9.1, seeks to compare the risk adjusted cost of the project, in net present value terms, for 3 alternative procurement routes.

### 9.1.2. Background

Three options have been considered by the Board for implementing the projects. These are:

1. Greenfield Option – A new build whole site solution for all facilities currently provided at the Southern General site, together with a new Adult Acute and Children's Hospitals, plus related facilities. Land for a Greenfield site would be required under this option.
2. **"**Option 1**"** – This option represents an entire new build solution on the current Southern General site for the Adult Acute and Children's Hospitals, plus new build Laboratories, and other related services.
3. **"**Option 1A**"** – A new build provision on the Southern General site for the Adult Acute and Children's Hospitals, plus the refurbishment of some existing facilities on the Southern General site to provide Laboratories and other related services.

For Options 1 and 1A, two scenarios have been considered. These are: 1) base case with single room provision at 57% within the Adult Hospital and; 2) alternative case with a 100% single room provision within the Adult Hospital.

In carrying out its VFM evaluation, the Board has considered three potential procurement routes:

1. Traditional Procurement – also referred to as the Conventionally Procured Asset Model ("CPAM")
2. Private Finance Initiative ("PFI")
3. Not for Profit Distribution Model ("NPD"). This model provides for the redistribution to the Board of any excess profit which may arise, in the form of "charitable surplus".

### 9.1.3. Overview of results of Value for Money Assessment

For both the "base case" and "100% single rooms" scenarios, Option 1A represented the preferred option, when compared to the Greenfield site and Option 1, in terms of risk adjusted net present value. On this basis, a full value for money appraisal was carried out on Option 1A, examining the relative costs of each alternative procurement route.

When assessed in risk adjusted net present value terms the three procurement routes produced very similar results, the variation between the options being only 1.1%. In terms of ranking the NPD model ranked first, followed by CPAM then PFI.

The PFI and NPD options are based on a senior bank debt funding solution. For a project of this scale, it might be that funders would examine the use of a funding solution based on bond finance as this approach may offer the possibility of lower cost funding. We have tested this sensitivity and the results indicate that this approach could potentially lower the risk adjusted cost for both the PFI and NPD by 2.2% to 2.5%. However at this time there are a number of difficulties in securing this form of funding, notably the state of international credit markets together with the fact that no NPD project has to date actually used this form of funding.

### 9.1.4. Quantitative Value for Money Assessment – inputs and assumptions

This section provides details of the main inputs and assumptions used in the VfM analysis.

#### (i) Capital costs

The table below includes the capital costs of the new Adult and Children's Hospitals, Laboratories, Administration, Westmarc and YPD. This is adjusted for VAT and equipment to reach the adjusted capital costs to be included in the shadow bid model.

| | Greenfield<br>£'000 | Option 1<br>£'000 | Option 1A<br>£'000 |
|---|---|---|---|
| Input for Shadow Bid Model | 1,472,169 | 759,158 | 676,782 |

**(ii) Optimism Bias**

A provision for optimism bias is incorporated into capital cost estimates to mitigate against the possibility of cost under estimation on capital projects. As such, a provision for optimism bias is designed to capture, in financial terms, the likely additional costs associated with the crystallisation of key risks. The level of provision is based on historical experience within the Public Sector and reflects advice received from the Board's Technical Advisors.

**(iii) Lifecycle and Facilities management costs**

The financial model incorporates provision for lifecycle and facilities management costs.

The lifecycle and hard facilities management costs, which will be incurred over a 30 year period commencing April 2010, are discounted to present values.

Hard FM costs for the Adult and Children's Hospitals were provided by our Technical Advisors. For the other facilities the Board has based its costings on the adjusted floor areas of the additional facilities.

The Adult and Children's Hospitals Lifecycle costs inputs from Technical Advisors have been indexed from the base date of Jan 2007 to the construction start date April 2010. The lifecycle costs for the other facilities have similarly been indexed to April 2010.

**(iv) Risk Adjustment**

As different procurement methods bring different risks which require to be managed, it is necessary to identify and quantify relative risk impact in carrying out VFM assessments.

Incorporated into the value for money analysis are risk adjustments based on the outcomes of risk workshops carried out by the Board. These take account of the relative impact which a wide range of different risks might be expected to have on every cost element within each of the alternative procurement routes. For the CPAM procurement model, the risk adjustment for the base case scenario equates to 19.6% of the value of the CPAM, of this 12.1% could be transferred under the NPD or PFI procurement models with 7.5% retained under all procurements.

**(v) Tax Adjustment**

It is necessary to take account of the relative impact of taxation applicable to each procurement route in carrying out VFM assessments. This has been provided for as required by existing Green Book Guidance at 6%.

**(vi) Shadow bid (i.e. PFI and NPD) model funding assumptions**

The shadow bid model is based on a senior bank debt funding solution. Funding terms have been estimated by Finance Advisors on the basis of current market conditions.

A LIBOR rate of 5.5% has been used, representing current market rates plus a buffer of c50bps. As the Board retains the risk of movements in swap rates the use of this buffer is recommended by guidance for projects at this stage of developments.

A fully indexed unitary charge has been applied.

**(vii) Discount rates**

The net present value calculations have been performed to a base date of 1 May 2010.

The Treasury discount rate of 3.5% real (6.0875% nominal) has been used for all cash flows except for any charitable surpluses (NPD model only)

Charitable surpluses are discounted at 6.0% real (8.65% nominal) reflecting the fact that the surplus cash flows are at risk. This methodology is consistent with previous NPD projects.

**(viii) Capital Funding Option, including appraisal of potential for bond finance**

The assessment of quantitative value for money between the procurement routes was based on a senior bank debt funding solution for both the PFI and NPD options. For a project of this scale funders might be expected to examine a capital markets based funding solution based on bond finance as this may offer lower cost funding. Accordingly, this funding option has been the subject of further work.

The results of this further work are consistent for both the PFI and NPD options, indicating that bond finance could potentially lower the risk adjusted NPV for both the NPD and the PFI option. In net present value terms the cost would reduce by 2.2% to 2.5%

Ranking of the procurement routes on this basis shows NPD representing the lowest risk adjusted value for money, followed by the PFI and thirdly the CPAM option.

The results of the sensitivity analysis indicate that a bond option within the NPD procurement could be the option that provided the largest quantitative value for money benefit. However it is important to note that a bond has not been used to date to finance any NPD project that has closed in Scotland. Were the project to be the first to use this structure there would be a number of challenges to be overcome, these would include:

- Developing a governance and contractual structure that was acceptable to the private sector partner, funders and the Board.
- The requirement to obtain investment grade status from appropriate rating agencies, this would cover an assessment of the financial strength of both the private sector partner and also the Board.
- Securing a financial arrangement that would guarantee payments to the bond holders

If not satisfactorily resolved, the above factors in addition to movements in the cost of market funds would impact on the pricing of the bond solution and could erode the relative value for money benefits of this potential funding solution.

### (ix) Comparison of net present values of alternative procurement routes

Value for money analysis
Base Case Scenario

| NPV | | Greenfield CPAM £'000 | Option 1 CPAM £'000 | Option 1a CPAM £'000 | Option 1a PFI £'000 | Option 1a NPD £'000 |

## 9.3 AFFORDABILITY OF PROPOSAL FOR NEW ADULT AND CHILDREN'S HOSPITALS IN CONTEXT OF NHSGG&C 10 YEAR FINANCIAL PLAN

### 9.3.1. Revenue Consequences

A top level 10 year financial plan is set out in the table below with a more detailed summary provided in Section 9.4. This projects the Board's anticipated sources of additional revenue funds and likely expenditure commitments over the forthcoming 10 year period, including the additional cost commitment associated with developing new Adult and Children's Hospitals on the Southern General site.

Table 13: Top Level Financial Plan : 2008/09 – 2017/18

| | 08/09 £'M | 09/10 £'M | 10/11 £'M | 11/12 £'M | 12/13 £'M | 13/14 £'M | 14/15 £'M | 15/16 £'M | 16/17 £'M | 17/18 £'M |

| | | | | | | | | | | |

**Notes** :

1. Forecast additional funding includes additional funding related to general funding uplift and excludes anticipated funding related to specific ring fenced funding provisions set aside by SGHD. The only exception to this is the specific provision established in respect of "Access to Services" where it is assumed that NHSGG&C will receive £23m over the 3 year period to 2010/11. It is assumed that this funding will be fully committed during this period.

2. Unavoidable expenditure growth/existing commitments comprises anticipated additional expenditure on pays, prescribing, non-pays, capital charges, and all unavoidable service commitments already entered into for the period to 2017/18.

3. The financial plan anticipates that the existing funding deficit related to Clyde is managed to a recurring financial breakeven position over a 3 year period by a combination of recurring and non-recurring cost savings and transitional funding provided by SGHD. The financial summary contained within Section 9.4 provides further details of the Clyde financial position, showing how this features within the context of the 10 year financial plan.

4. A high level cost savings summary is provided within Section 9.4. A summary of the key assumptions which underpin the financial projections shown in table 13, including an overview of the Board's financial strategy and appraisal of financial risk, is provided below.

i) **Key Assumptions**

- A general funding uplift of 3.1% per annum has been assumed. This is set below the recently announced general funding uplift for 2008/09 of 3.2% to allow for the potential impact which NRAC implementation might have on the Board's level of general funding uplift in future years.

- A general pay uplift of 2% per annum is provided for. This is reasonable in the light of current UK government policy and reflects the significant reduction in general funding uplift which will apply from 2008/09 onwards.

- An overall annual growth rate of 6% in prescribing costs is assumed across primary care and acute care. This allows for an average annual growth rate of 5.25% in primary care prescribing costs and 8.5% in acute prescribing costs,

before cost savings and other cost containment measures. This gives an overall annual rate of growth of 6% and approximates closely to the average annual growth rate experienced in past years. This can be regarded as a reasonable basis for projecting future average cost growth over a future period which extends to 10 years.

- A provision of 1.5% per annum is made for the general growth of non-pay costs (excluding prescribing costs), with the exception of years 1-3 where a reduced provision equivalent to 1% is made. This reduced level of provision in years 1-3 years is linked with the development of a major cost savings programme by the Board aimed at driving out cash releasing savings of 2% per annum on an annual basis in line with Government targets. The sustainability of this level of provision over a period extending beyond 3 years is considered unlikely and so a higher level of provision is set for the years beyond 2010/11.

- The financial plan includes all known existing financial commitments related to clinical and other services. These are presented within the section "Existing Programme Commitments". The projected step up in revenue costs associated with the new Adult and Children's Hospitals is shown within this section. This shows a revenue cost commitment of £59.5m per annum, which is the revenue cost commitment associated with the new Adult and Children's Hospitals and those related capital schemes which are funded by the Board's general capital funding allocation. Provision is also made for prospective new service commitments for 2009/10 onwards at a level of £8m per annum, split 50:50 between Acute and Non Acute Services. This level of provision will require to cover all new changes/developments which the Board is required to commit to over a ten year period, including all those national, regional and local changes/developments/initiatives which are unable to be funded by the specific ring fenced funding allocations which SGHD establishes annually to fund service change/development. This represents, in broad terms, a reduction of approximately 20-30% on the equivalent level of provision in 2008/09, however is considered realistic in the light of increasing levels of centrally managed ring fenced funding allocation, and a reduced level of general funding uplift. It should be noted that £8m per annum is regarded as a maximum provision, and may be scaled back, as required, to offset unforeseen cost pressures which may arise.

- The financial plan assumes that the Board will succeed in developing a cost savings plan which is capable of delivering 2% recurring cash releasing savings per annum during the period 2008/09 to 2010/11. This is in line with the SGHD targeted level of savings for the 3 year period to 2010/11. The cost savings plan includes restoring Clyde to a position of financial breakeven within the 3 year period.

The Board is currently engaged in the process of developing a detailed cost savings plan for 2008/09, which is aimed at delivering £33m of recurrent cost savings, with the objective of completing this by June 2008. Thereafter the process of developing plans for 2009/10 and 2010/11 will commence. For the years beyond 2010/11, a reduced level of cost savings is assumed, with annual targets set within a range of 0.5% and 1% per annum. This comprises a number of specific areas of cost saving associated with implementation of those changes related to the establishment of new Adult and Children's Hospitals, supplemented by a general annual savings programme which equates to 0.4% per annum.

At this stage, the Board has already identified £45m within its 10 year cost savings plan, specifically related to its existing Acute Services cost base, which is capable of being released to fund an anticipated step up in annual revenue cost of £59.5m associated with the establishment of New Adult and Children's Hospitals. During 2008/09, it will work at bridging the residual "gap" in parallel with developing an overall cost savings plan for 2009/10 and 2010/11.

(ii) **Overview of financial strategy**

The cornerstone of the Board's financial strategy, and the most significant individual feature of the Board's financial plan for the forthcoming 10 year period is its cost savings programme. This dominates its financial planning for the 3 year period to 2010/11, with cost savings/containment/reduction initiatives requiring in total to generate an average of £35m per annum. This level of saving is required in 2008/09 and 2009/10 to ensure that the step up in revenue cost associated with commissioning 2 ACAD's at Stobhill/Victoria in 2009/10 is fully funded, and continues into 2010/11 as the process of building up sufficient revenue funding capacity to fund the two new hospitals, in the lead up period to their commissioning, gets underway. The scale of additional cost commitment associated with the two new hospitals, £59.5m, demands that the volume of revenue funding which is required to pay for them, is built up over a number of years leading up to the commissioning of the hospitals…otherwise the Board would be unable to accommodate the running costs of these hospitals within the envelope of its available funds, while maintaining its commitment to achieve financial breakeven.

By commencing this process in 2010/11 and continuing to target further cost savings in the years beyond 2010/11 the Board's strategy is to amass an adequate reserve of revenue funding which will match the additional cost commitment which the new hospitals will bring. The financial plan shows the build up of this funding reserve over a 5 year period commencing in 2010/11. By building up revenue funding in this way, the Board will also be able to generate in the interim period the level of transitional funding it requires on a non-recurrent basis to manage through the process of establishing the new hospitals. This is capable of being covered year on year by the build up of revenue funding identified within the financial plan. The deployment of these funds year on year will be managed within the context of the Board's financial plan so that it complies with its statutory requirement to contain expenditure within its overall revenue resource limit.

(iii) **Appraisal of Key Risks**

The key areas of risks are identified below:

(a) **Funding uplift reduces below 3.1%**

The 10 year plan projects that NRAC implementation will impact on the Board to the extent of restricting its annual general funding uplift by 0.1% or £2m per annum. This assumes that a measured approach will continue to be taken by SGHD to the implementation of formulaic changes affecting Health Board funding levels, mirroring the approach taken to the implementation of the Arbuthnott formula in recent years.

It is reasonable to assume that SGHD will continue to adopt this approach in order to avoid the potential for financially destabilising Health Boards, particularly at a time when the level of general funding uplift has been set at 3.2%, a much reduced level than in recent years. Accordingly, a 0.1% funding adjustment is provided for in preparing the Board's financial plan. This is equivalent to a cumulative reduction in revenue funding of £20m over a 10 year period, a significant reduction in funding availability in the context of an overall annual general funding uplift of 3.2%. On this basis it is not considered likely that SGHD would seek to implement a further restriction on funding unless the level of future general funding uplift exceeded 3.2%, in which case it is reasonable to assume that a proportionate approach would be taken.

(b) **Annual General Pay Uplift Exceeds 2%**

This is clearly a key area of risk. For any year where the rate of general pay uplift exceeded 2% by 0.5%, without any corresponding elevation of the rate of general funding uplift, a cost pressure of £6.5m - £7m would emerge.

The Board would seek to manage the potential impact of this within the context of its 10 year financial plan by scaling back the level of funding set aside for prospective new funding commitments. This would offer scope for containing an increased level of general pay uplift of up to 2.5% for 3 years out of the 10 covered by the 10 year plan. Beyond this, the Board would have little room for manoeuvre, however it is reasonable to assume that a more frequent incidence of annual general pay uplift exceeding 2% might lead to a review of approach on pay awards which is likely to produce an equivalent change to the level of general funding uplift so that its impact was cost neutral within the context of the Board's 10 year financial plan.

(c) **2% cost savings target is not achievable in 2009/10 – 2010/11**

The sustainability of a cost savings programme, aimed at generating recurring savings of 2% per annum, over an extended period of 3 years is also a key area of risk. It is recognised that the Board is entitled to include non-recurring cost savings and credit these towards the achievement of its 2% cost savings target over the 3 year period to 2010/11, however the generation of recurring cost savings during this period is necessary on two counts:

1) The requirement to fund the step up in recurring cost commitment associated with commissioning 2 new ACAD's in 2009/10.

2) The requirement to release sufficient funds to provide transitional funding cover during the lead up period to commissioning the new Adult and Children's Hospitals.

Nevertheless, there remains the possibility that a challenge of 2% recurring cost savings per annum proves unsustainable over a period of 3 years. In the event that this proves to be the case, with up to 50% of the target proving unachievable in years 2 and 3, the Board would face a "gap" of some £30m within its 10 year financial plan. It's strategy for addressing this would be as follows:

1) Spread the recurrent cost savings challenge across a longer period than 2009/10 and 2010/11.

2) Identify and plug in non-recurrent cost savings to "fill the gap" in each of 2009/10 and 2010/11, thereby securing the achievement of SGHD's cost savings target for each of these years and preserving the required level of transitional funding.

3) Reduce the level of provision set aside for prospective new programme commitments by up to £3m per annum over a 9 year period. This particular funding provision might also serve as form of contingency fund to cover for the potential of reduced/delayed achievement of cost savings target(s) in future years beyond 2010/11.

By following the above strategy, the Board would seek to manage the risk of its cost savings programme either not delivering the targeted level(s) of cost savings or experiencing delay(s) in achieving specific targets within individual years. Indeed, the same strategy would also be applied, albeit more comprehensively, in the event that the Board is confronted by a combination of pay pressure and delay to the achievability of its cost saving programme.

### 9.3.2 Capital Consequences

A top level capital plan is set out in table 14 below. This reflects the Board's preferred option for procuring its new Adult and Children's Hospitals, which envisages these being funded by Public Capital.

Table 14: Top Level Capital Plan : 2008/09 – 2015/16

| | 08/09 £'M | 09/10 £'M | 10/11 £'M | 11/12 £'M | 12/13 £'M | 13/14 £'M | 14/15 £'M | 15/16 £'M | Total £'M |
|---|---|---|---|---|---|---|---|---|---|
| Forecast Capital Funding | | | | | | | | | |
| General funding allocation | 97.6 | 97.6 | 97.6 | 97.6 | 97.6 | 97.6 | 97.6 | 97.6 | - |

| New adult/children's hospitals – enabling Schemes | 14.9 | 39.4 | 28.0 | 7.7 | 13.0 | 15.1 | 6.3 | - | |
| Less : slippage/brokerage to be identified | - | (19.5) | (5.1) | - | - | - | - | - | |
| | 148.1 | 129.0 | 85.6 | 84.6 | 81.6 | 76.6 | 76.6 | 106.6 | |
| Residue of available capital funds | - | - | 25.0 | 25.0 | 25.0 | 30.0 | 30.0 | - | 135.0 |
| Add : Capital Receipts | - | 10.0 | 15.0 | 25.0 | 30.0 | 18.0 | 18.0 | 19.0 | 135.0 |
| : Endowment Funding | - | - | - | 10.0 | 10.0 | - | - | - | 20.0 |
| NHSGG&C : total available funding | - | 10.0 | 40.0 | 60.0 | 65.0 | 48.0 | 48.0 | 19.0 | 290.0 |
| Proposed supplementary allocation of capital funds by SGHD (specific allocation) | - | 17.5 | 100.8 | 176.3 | 170.4 | 94.9 | 10.8 | (19.0) | 551.7 |
| | - | 27.5 | 140.8 | 236.3 | 235.4 | 142.9 | 58.8 | - | 841.7 |
| Capital expenditure... new adult / children's hospitals | - | 27.5 | 140.8 | 236.3 | 235.4 | 142.9 | 58.8 | - | 841.7 |

The total capital funding requirement associated with the provision of the new Adult and Children's Hospitals is £841.7m. It is planned that this will be funded by combining the following sources of capital funds to create the required funding pot:

| | | £'M | £'M |
|---|---|---|---|
| 1. | Specific provision within Board's 10 year capital plan, set aside from annual general capital resource allocations. | | 135 |
| 2. | Capital receipts generated from disposal of sites declared surplus | | 135 |
| 3. | Allocation from Board's general endowment funds | | 20 |
| 4. | SGHD – specific allocations of capital funds for<br>a) children's hospital<br>b) adult hospital | <br>205<br>346.7 | <br><br>551.7 |
| | Total | | 841.7<br>==== |

The Board's capital plan provides for the capital contribution identified at (1) above to be made available out of its routine annual allocation of capital funding. This is projected to remain static over the 10 year period and so has been fixed at the 2008/09 level of £97.6m per annum. It also provides for further expenditure on enabling (preparatory) schemes totalling £88m to be funded from general capital funding….this is part of the expenditure provision shown within the "enabling schemes" category within table 14 above. Because of the heavy concentration of enabling (preparatory) schemes in the first 3 years of the plan, it has been necessary for the Board to restrict the amount(s) of capital which it is able to set aside for prospective new commitments in the first 3 years of the plan to an absolute minimum, with only £20m set aside for new schemes over a 3 year period. In addition, the amount which the Board routinely sets aside to cover minor local schemes/health and safety related schemes etc has been scaled back to £15m per annum, representing 70% of existing expenditure levels.

Even after having carried out such an aggressive process of prioritisation, the Board's capital plan is over-committed by almost £25m in total over an initial 3 year period, with the bulk of this arising in 2009/10. It is assumed that this can be managed through a combination of slippage/brokerage in conjunction with SGHD on a year by year basis, over the 3 year period. On the basis of previous experience and recognising the scale of the over-commitment, which equates to 8% of total available capital funding for the 3 year period, this should be both manageable and achievable.

It is further assumed that the Board is capable of generating £135m over a 10 year period from the disposal of sites declared surplus. This is based on a series of projections carried out by the Board's Property Advisors, based on the potential disposal of a wide range of sites including Victoria, Mansionhouse, Yorkhill, Gartnavel (part), Stobhill (part), Dykebar (part), Broomhill, among others, which are forecast to produce capital receipts during the forthcoming 10 year period. The wide range of sites which will become available for disposal during the forthcoming 10 year period provides the necessary level of reassurance that this level of targeted receipts can be achieved.

It is further assumed that the Board will be able to source up to £20m from its general endowment funds to contribute towards the capital costs of the new Adult and Children's Hospitals. With the total amount of endowment funds, currently standing at in excess of £80m, and over £30m within general endowment funds, this can be considered to be a realistic and reasonable assumption.

The final part of the capital funding package £551.7m represents the specific allocation of funding which is sought from Scottish Government Health Department (SGHD) and which is an integral part of the proposal contained within this outline business case. If SGHD is able to approve this specific allocation of capital funding, in line with the timescales identified within the capital plan, this will provide the balance of capital funding which is required to make the provision of the new Adult and Children's Hospitals affordable within the context of the Board's capital plan.

# 10. PROCUREMENT

## 10.1 PROCUREMENT OF BUILDING – PUBLIC FINANCE PROCUREMENT ROUTE

The business case considers the best way of meeting the business objectives while achieving best value for money, the optimum balance of risk and control and funding.

There was little to differentiate the alternative procurement routes in terms of their capacity to deliver Value For Money, however a publicly funded capital route offers the potential to deliver an affordable solution. The preferred procurement route is therefore through public finance. There are a range of contract options that are available to the Board, some of these transfer programme , design and cost risks better than others and the Board need to carefully consider the pro's and con's of each before making a final decision.

Ideally, the procurement route should try to integrate design, construction, operation and ongoing maintenance into the mix as the design develops, even if operation is not part of the service delivery. To assist the Board to consider and select the most appropriate contract form, a procurement workshop has been set up for 19th February 2008 to review options, evaluate and select a preferred route. The workshop will be attended by the Acute Division's Chief Operating Officer, the Director of Finance, the Project Owner, the Project Director, Project Team members plus technical, legal and financial advisers.

The workshop will focus on the Board's key requirements in respect of cost and programme risk transfer, robust and tested procurement route, value for money and whole life cost, expenditure and programme requirements. Key to the selection process is the requirement to select a process that sees a start of construction work in the 2nd quarter 2010, with completion of the new Children's Hospital 1st qtr 2013 and the new adult acute hospital in 2nd qtr 2014.

The preferred public finance option will be submitted to the Health Board and Scottish Government for consideration and ratification as part of the outline business case. It will also be independently assessed though the OGC Gateway Review process to provide assurance to the Board and the Scottish Government that the method shown has been scrutinised and confirmed. [1]

The contract form will dictate the timescales for following tasks and timetable, however it is anticipated that following market sounding and preparation of more robust design and project requirements (brief and specification) that a competitive process will follow involving at least three contracting teams over a 9-12 month process, culminating in the selection of a preferred partner completion of Full Business Case by mid 2010. The detail of the process will be expanded on completion of the workshop and confirmation of the preferred route.

## 10.2 PROCUREMENT OF EQUIPMENT

The retention, transfer, procurement and commissioning of new and existing equipment will be a complex project requiring detailed and effective management.

The financial appraisal includes provision of new equipment. This includes Group 1 and specified Group 2 equipment including CT scanners, MRI scanners and Gamma cameras.

Within the contract for constructing the new hospitals it will specify the services requirement for all Group 2 equipment (large and small) in order that the specialist equipment contractors will be able to supply and fit required equipment.

It is the intention of the Board to procure all identified group 2, 3 and 4 equipment from public capital via the NHS Greater Glasgow & Clyde procurement department.

## 10.3 PROCUREMENT OF IT

- The project includes for the provision, maintenance of structured wiring. These elements will need to be able to support both the current and future applications.

- It will remain the Board's responsibility to support existing and to procure new application hardware and software through separate contracts.

# 11. WORKFORCE ISSUES

## 11.1 INTRODUCTION

The development of the new South Glasgow Hospitals will be supported by a workforce, which has the skills and competencies to provide modern, quality health care of the 21st century.

The Health Board's workforce development plan is set within the context of the NHS Careers Framework, and over the next few years, will shift the balance of the workforce to enhance the role of support staff at levels 1-4 to allow professionally qualified staff to use their skills in the most effective way.

At the same time, significant economies of scale will be achieved in the use of medical, nursing, allied health professions and support staff, as the number of inpatient sites reduce.

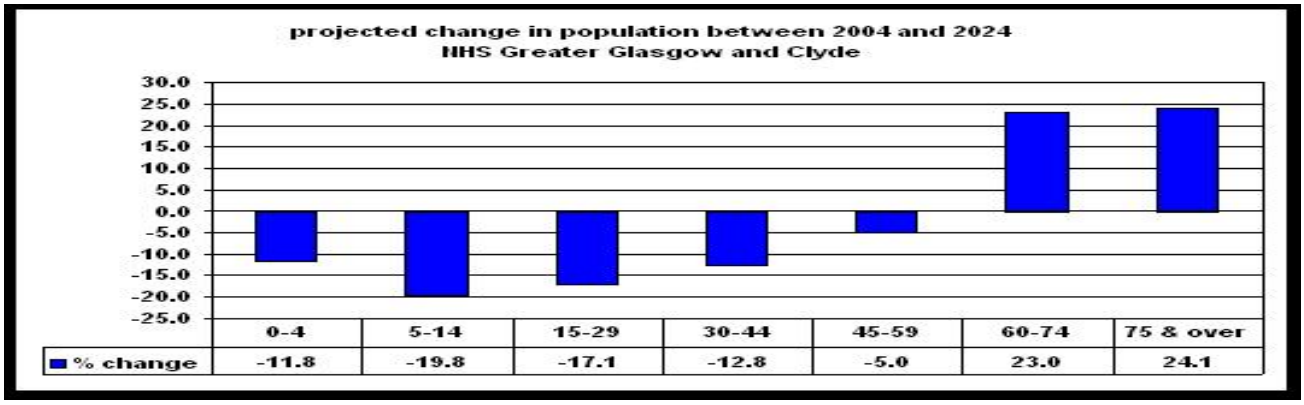
## 11.2 CONTEXT

The latest national workforce planning report, "Better Health, Better Care*:* Planning Tomorrow's Workforce Today" was published in December 2007. This strategic document sets out the direction of travel for future workforce planning, with a particular focus on integration with financial planning and service delivery. The workforce plan to support the new South Glasgow Hospital is therefore fully integrated with the service and bed model, and the affordability model. It is also set with the Board's overarching workforce plan, which supports the Local Delivery Plan.

The "Careers Framework" was formally launched in Scotland in October 2006. It supports NHS Boards and regions to articulate the future workforce development needs through alignment with workforce planning and modelling, the implications of service redesign as well as to support robust succession planning. The "Careers Framework" is also linked to the Knowledge and Skills Framework (KSF) and to the use of national occupational standards in producing development plans for new as well as existing roles. With the support of the Scottish Government and NHS Education for Scotland, the Board are using the Careers Framework to plan the competences required in the future workforce.

## 11.3 THE POPULATION PROFILE

Achieving the workforce needed in the future will be challenging given the shrinking labour market. There will be a fall in the number of young people entering the labour market and an increase in those approaching retirement. At the same time, the increased proportion of the population aged over 60 and, particularly, over 75 will increase demand for health care. The following chart shows changes in the age distribution of the NHS Greater Glasgow population up to 2024.



Population trends suggest that there will be a 17.1% fall in the number of young people entering the labour market and a 5% decrease in those approaching retiral age. There will be a 23% increase in those having just reached retiral age and an 19.8% decrease in school children. This constitutes a major shrinkage of the local labour market.

However, at the same time there has been a significant shift in the fortunes of the resident working age population of the city. At the end of the 1990s, just over half of the city's working age resident population were in employment. By the end of the present decade, this will have risen to over seven in ten.

To better prepare NHS Greater Glasgow and Clyde to meet this challenge, the Community Health and Care Partnerships and the Community Health Partnerships are working within their local communities on employability. A significant element of this is to ensure recruitment into NHS Greater Glasgow and Clyde from a wider pool of people who would not normally access NHS employment. The Board's pre-employment training programme, Working for Health in Greater Glasgow will continue to play a critical role in this, ensuring that people from the local communities surrounding the new hospitals are ready for employment.

In planning for the future workforce, the Board are working in partnership through a "Strategic Alliance"; with the Further and Higher Education sector; and with other NHS Boards – the Golden Jubilee National Hospital and NHS Education for Scotland in particular. This will ensure that further education in particular is placed to assist in developing skills necessary for the new hospital environments

## 11.4 WORKFORCE PLANNING

The future workforce envisaged in the workforce plan is based on the principles of **affordability, availability and adaptability**.

Affordability

The workforce plan is based on the Financial Plan. This assumes that pay rates increase by no more than the inflationary uplift received by the Health Board in its weighted capitated funding. It is assumed that, over the next few years, the consolidation of new contractual arrangements (Consultant Contract, GMS Contract and Agenda for Change) will lead to productivity gains. Development of new services will require to be balanced with "efficient government" gains in some backroom function (supplies, pharmacy, finance and human resources for example.) This will allow a shift from indirect to direct care within the overall resource envelope. Planning for this will involve setting indicative targets for direct care/support staff ratios.

Availability

Using the Careers Framework the Board is developing a career pathway for the whole workforce.

The significant demographic changes in the available workforce in Glasgow over the next decade has led NHS Greater Glasgow and Clyde to focus on a series of strands of work to ensure future recruitment to the Board by widening the pool of labour available to us.

NHS Greater Glasgow & Clyde is committed to the "Welfare to Work" agenda in Glasgow. "Working For Health" currently has 260 trainee places per year with a target of bringing 75% of these into employment. Working for Health is a generic pre-employment training programme but it is focused on the NHS and is demand-led in that we guarantee permanent employment on successful completion of the training programme. It started off as a six week "one size fits all" programme but has been redesigned as a flexible two, six or twelve week programme. Working for Health will provide one-third of NHS Greater Glasgow and Clyde's non-professional recruits.

While the Board currently provide continuing professional development for professional staff, and in the future more than induction and job-related skill training for the non-professional workforce will be need to be provided. There will be new roles designed to provide career opportunities for non-professional employees.

Greater Glasgow has the largest Black and Minority Ethnic population in Scotland (4.5% or 39,318 people)[1]. 38.7% of the total Scottish black and minority ethnic population live in the Greater Glasgow area, and 45.7% of all black and minority ethnic people in Greater Glasgow are Pakistani. The black and minority ethnic population is younger than the White population (29.5% under 16 compared to just under 19% for the White groups). These figures are based on the 2001 census and, therefore, do not include the majority of asylum seekers and refugees presently residing in Greater Glasgow as they arrived after the census date. Evidence indicates that the black and minority ethnic population is under-represented in the Board's workforce. It is important that the black and minority ethnic population is drawn on, not just in order that the workforce more fairly represents the local population, but also because the young black and minority ethnic population is likely to already be more than 5% of the population and to become a more significant proportion of the population in the future.

Asylum seekers are not allowed to take up employment but can be encouraged to undertake voluntary work or training which will prepare them, if successful in seeking right to remain in the United Kingdom, for NHS employment. With the support of the Scottish Government, the Board have appointed a Refugee Workforce Development Officer to encourage and facilitate professional and non-professional refugees to join the workforce. A training programme has been developed to prepare refugees for participation on the pre-employment training programme.

[1] Ethnic Group Profile From The 2001 Census - NHS Greater Glasgow Area, NHS Greater Glasgow Information Services September 2005

Adaptability

The key to success will be in how the current workforce adapts to new roles and new ways of working. It is recognised that this will require an increased investment in education, training and development. There will be a shift of resources from indirect to direct care in rationalising and rebuilding the estate and as other efficiency savings are achieved in backroom functions. The workforce of the future will be better supported by more highly-trained but not, necessarily, professionally qualified staff.

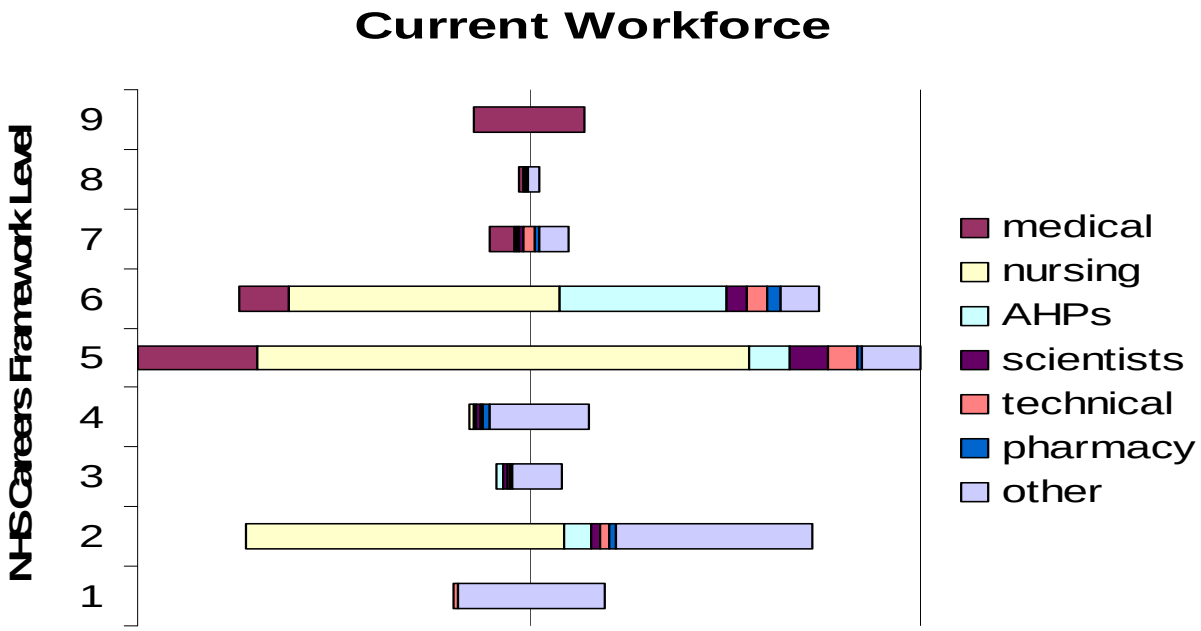
Agenda for Change and the associated Knowledge and Skills Framework allows the reduction in demarcation between professionals and to develop new roles around the patient. A number of career framework based projects are in place across NHS Greater Glasgow & Clyde. NHS Education for Scotland is funding a project aimed at level 2/3 in nursing and across allied health professions working in rehabilitation and assessment. The Scottish Government is supporting a national project aimed at level 4 for nursing, AHPs and social work within acute services and partnerships. A further project aimed at level 6/7 is also being funded by the Scottish Government for nurses in Care of the Elderly services.

These projects will inform the development of the competences profiles required to enable staff to provide appropriate care. While some of this change will be achieved by replacing staff who choose to leave and are replaced by staff performing different roles, much of the change will involve existing staff adapting to new roles.

## 11.5 FUTURE WORKFORCE PROFILE

The NHS Greater Glasgow and Clyde workforce has over 40,000 substantive staff currently in post and approximately one in four of the NHS workforce in Scotland works for NHS Greater Glasgow and Clyde. Acute services including children's services account for the majority of the workforce. The acute services workforce is deployed at Stobhill Hospital, the Victoria Infirmary, the Western Infirmary, Glasgow Royal Infirmary, Gartnavel General Hospital, the Royal Hospital for Sick Children and Queen Mother's Hospital at Yorkhill and at the Southern General Hospital.

The current workforce against the levels within the Careers Framework is set out below.



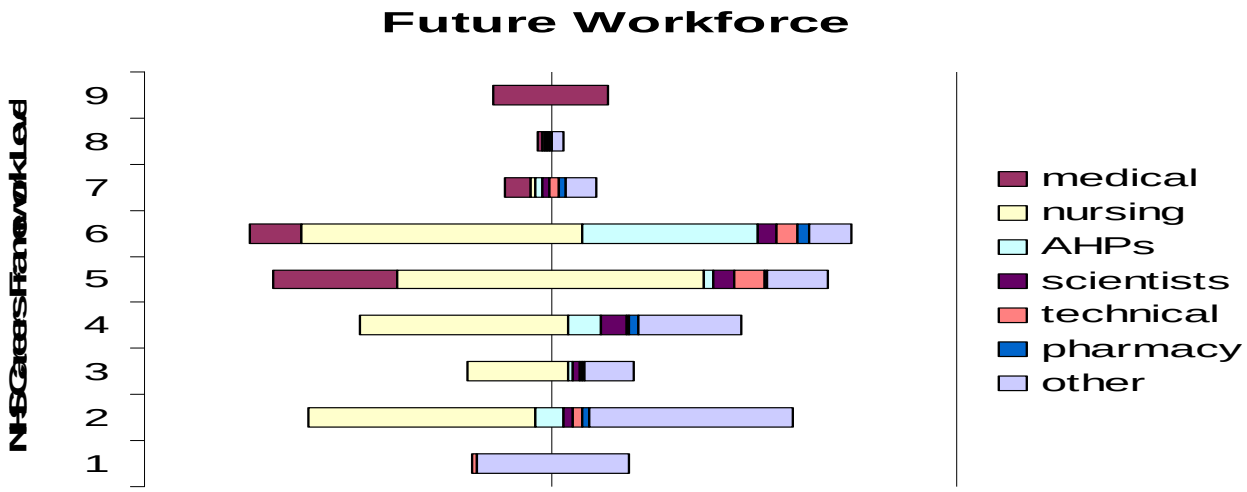
This shows a wide variance in the distribution of staff across the competency levels, with the largest groups of staff currently mapped to levels 6, 5 and 2. (Level 9 equates to very senior roles; Level 5 would predominantly represent new graduates entering the workplace; Level 1 equates to support worker roles.) It highlights that there are currently limited opportunities for career progression. It also demonstrates that there are two workforces: those from level 1 to level 4 and those who enter as newly qualified staff/ graduates at level 5 and have the opportunity to progress up to level 9.

The Acute Services Review will result in the following pattern of services,

- two new ambulatory care hospitals providing day surgery and outpatients at the Stobhill and Victoria sites
- closure of the Western Infirmary, Victoria Infirmary, Stobhill Hospital, Queen Mother's Hospital and Royal Hospital for Sick Children
- movement of inpatient services to the new South Glasgow Hospital, Glasgow Royal Infirmary and Gartnavel General

The opportunities for redesign offered by the new investment in facilities and the consolidation of workforce onto fewer sites will result in a significant re-profiling of the workforce.

The Board's new workforce set against the levels in the Careers Framework is set out below.



This graph suggests that in the future there will be a requirement for a more even distribution of staff across the competency levels with particular investment in levels 3 and 4. This would allow for greater flexibility and career progression underpinned by an appropriate suite of training and development opportunities.

The Medical Workforce

With the reduction in the number of acute in-patient sites, there will an impact on the medical workforce, particular in Anaesthesia, Medicine, Accident and Emergency and Surgery. At the same time the impact of Modernising Medical Careers will be working its way through. In these specialties, there will be a reduction in the rotas required to provide cover, and this will mean the loss of some training posts, which will be reflected in the training programmes in the West of Scotland. However, the impact will mainly be on PAs and availability supplements paid to Consultant medical staff reflecting a reduced burden of on-call. Similarly, as junior doctors rotas become less onerous, there will be further improvements to working hours and this will reflect in lower banding payments to junior doctors. These changes in combination are of the order of 1.7% of the overall medical staffing budget within acute care.

The Nursing and Midwifery Workforce

Nursing and Midwifery constitute the largest element of the workforce. The majority - but not all - of the workforce is ward based and their workload relates to factors such as the number of beds, the dependency of patients and the layout of the ward.

An exercise has been undertaken to measure the potential impact on the nursing workforce. This work is predicated on the development of the agreed bed model for acute services and a bed model for children's services in anticipation of the movement to the SGH site. Workforce data and future scenario assumptions have been considered with professional leads and service directors, and these have subsequently been used to inform future workforce modelling. In this way it has been possible to work at individual directorate level as well as at a service wide level. This has allowed for due consideration as to where future efficiencies may lie.

Further work needs to be done to refine an appropriate grade mix. This will also be informed by the recommendations from the Nursing and Midwifery Workload and Workforce Planning Report. Account will also have to be taken of the workload implications of developing standards set by the Nursing and Midwifery Council.

Specifically there will be a reduction in the number of ward manager posts, with a realignment of resources to Agenda for Change Band 5. With staff spread across fewer sites there will be a requirement for less senior managerial capacity and this will provide an opportunity to look at the way practice education and development support is deployed.

There will in addition to the re-profiling of the nursing workforce be a reduction in overall headcount related to a reduced number of beds. The combination of all of these changes comprises 2.6% of the current nursing complement. These changes will be managed in line with the Boards "Managing Workforce Change Policy". Over the next six years there will be regular review of workforce capacity. Currently, just over 11,000 nurses and midwives work within the Acute Sector, with a turnover rate of just under 7% annually. Therefore achieving the appropriate workforce profile will require the Board to carefully match demand and supply while at the same time rebalancing the skill mix, but is eminently manageable within the timescale available

The Allied Health Professions Workforce

The Allied Health Professions workforce is diverse including dieticians, occupational therapists, orthoptists, physiotherapists, speech and language therapists, podiatrists, radiographers, prosthetists and orthotists.

New models of care will be developed – particularly within rehabilitation and assessment services – and this will impact on the make-up of the workforce. Assistant practitioners, advanced practitioners and consultant Allied Health Professionals posts will be developed to provide a more balanced workforce to contribute to the new models of care. The need to use staff efficiently coupled with concerns about the future availability of certain graduate Allied Health Professionals and the impact of a shrinking labour market on student numbers and on recruitment of non-professionally qualified staff, has led to consideration of new roles and routes to professional qualification. Work has commenced on the development of competences for (generic) support worker and assistant practitioner roles.

The Administrative and Clerical Workforce

The staff groups outlined above are supported by a range of administrative and clerical staff – some working directly with clinical staff (e.g. medical secretaries) and some, indirectly, in backroom functions. Such staff make a significant provision to patient services. Backroom functions will benefit from developments in the automation of information (e.g. the introduction of a filmless x-ray service, electronic dictation and the electronic health record).

Facilities Management Workforce

The size of the facilities workforce will relate directly to benchmarked norms taking account of cost per square metre of estate. This will therefore lead to reduction in overall headcount, which will similarly be managed through the Board's 'Managing Workforce Change' Policy over the next few years.

## 11.6. CONCLUSION

NHS Greater Glasgow and Clyde has taken account of the requirements to develop the Outline Business Case and ultimately the Full Business Case and has invested in appropriate additional resource to support this. In developing the Board's Workforce Development Plan, there will be a continued commitment to ensure that work is undertaken in partnership with a range of internal stakeholders, including Trade Unions, as well as external stakeholder organizations in light of anticipated service change and re-design.

# 12. FACILITIES MANAGEMENT (FM)

This section outlines the Board's approach to Facilities Management.

## 12.1 BACKGROUND

The proposed new Southern Campus will consist of both new build and retained estate. Part of the retained estate includes a PFI building, the Langlands building, which houses in patient beds for care of the elderly, young physically disabled and dermatology. This is located on the extreme southern end of the site.

The Hard and Soft FM Services which are currently provided on the Southern site are shown in table 15 below.

**Table 15 – FM services provided to the Southern campus site by NHS Greater Glasgow and Clyde**

| Soft FM | Hard FM |
|---|---|
| Sewing Room | Grounds Maintenance |
| Portering Services | Estates Maintenance |
| Domestic Services | Estates MC Works |
| Waste Management | Energy Management |
| Linen Service | Boilerhouse |
| Supplies and logistics | Estates Workshop |
| General Services | Estates Helpdesk |
| Telecommunications | |
| Deceased Patient Movement | |
| Staff Changing | |
| Green Transport Management | |
| Catering Services | |
| Car Parking | |
| Pest Control | |

Within the PFI building there is a FM commercial contractor providing a small number of services, these are listed in table 16 below.

**Table 16 – FM services provided to the Langlands PFI building by commercial FM contractor.**

| Soft FM | Hard FM |
|---|---|
| Catering | Grounds Maintenance |
| Porter Services internal to building | Estates Maintenance |
| Domestic services internal to building | Estates MC Works |
| Internal Waste | Help desk |
| Staff Changing | Boilerhouse |
| Security | Estates Workshop |

## 12.2 THE HEALTH BOARD'S APPROACH TO FM

In planning the FM strategy for the site the new and retained configuration of the estate have been taken into account.

It is the Board's intention to provide all hard and soft FM services to the Southern Campus from within NHS Greater Glasgow and Clyde's facilities pool (with the exception of those currently provided by the commercial FM provider to Langlands). To ensure that the greatest efficiencies are achieved a benchmarking and value for money exercise will be undertaken to explore and identify the most effective methods of service delivery. In addition, work is taking place to identify any innovation that would assist the delivery of services and provide long term efficiencies. These will be investigated in more detail during the next stage of the project

# 13. INFORMATION TECHNOLOGY

## 13.1 OVERVIEW

Health Information Systems, and the underpinning Information Technologies will be key elements in support of Patient Care in the new hospitals.

At the present time, work is ongoing to develop a National eHealth Strategy for NHS Scotland, and whilst this work is as yet incomplete, there is a set of eHealth Aims that the evolving strategy will set out to achieve. These are as follows:-

- Patient and carer involvement and experience
- Evidence – based and safe care
- Integrated Healthcare
- Support for community based care
- Support for scheduled hospital care
- Support for unscheduled care
- Improved information intelligence
- Advanced eHealth
- Effective systems to improve productivity

Certain specific objectives will be required to be put in place in order to achieve the above aims. These sets of objectives fall into four main categories:-

- Information Strategy

The information strategy focuses on the needs of patients - both in terms of information clinicians require, to provide the best possible standards of care, and easy access for patients to information about their care.

- Software Applications Strategy

An Electronic Health Record (EHR) exists to support sharing of patient information, with strictly governed access. The founding principle is that receipt and delivery of NHS care implies acceptance by patients and their clinicians that information needs to be collected to high quality standards and accessed where appropriate to ensure best possible care.

The goal of EHR does not mean a single all-encompassing software application. Even if such a product existed, which is not the case at present, the strategy is founded on progressively making progress rather than ‘rip and replace’. This meaning of ‘EHR’ is therefore the umbrella term used to describe the key software applications which together make up support for all aspects of patient care. EHR in this sense will therefore be achieved through incrementally putting in place and connecting the necessary components.

- Delivery Strategy

Delivering the national eHealth Strategy must balance the need to deliver the long-term objectives and service improvements, whilst realising real service benefits from the outset and throughout the programme.

Planning for the delivery of the national eHealth Strategy will also recognise that NHS Boards are at different stages of maturity, in terms of integrating their existing eHealth services. In addition, there are a number of differing local priorities. The Delivery Programme will therefore include a degree of flexibility in recognition of the different baseline positions of NHS Boards.

- Infrastructure Strategy

The Infrastructure strategy will embrace technologies and services associated with the enabling, operating and management of technical resources appropriate to the delivery of the eHealth Strategy.

The approach to strategy development has been to identify the elements that contribute to the strategy together with their interrelationship with other aspects of the wider strategy, define the relevant and appropriate standards, align these to the wider strategic context and validate them against prevailing cornerstone activities and prospective procurement opportunities.

Each Health Board will require to establish its own roadmap of how to progress from its current baseline systems and technologies to achieve ultimate convergence with the National objectives.

For the purposes of the Outline Business Case, this section reviews:-

- IT requirements for the future
- The projects and work in progress towards achieving the above objectives
- The envisaged technical and environmental infrastructures that the new hospitals will require to house to support the evolving Information systems

## 13.2 REQUIREMENTS FOR THE FUTURE

### a) National Strategy

From a national perspective, *'Better Health, Better Care'* promotes a comprehensive health information system built around an Electronic Health Record. The eHealth strategy is concerned with delivering that comprehensive system and NHS GG&C will work towards this goal through all of its developments.

Detail of the strategy is still under development, but the ultimate objectives are to have:-

- Access to a personal Electronic Health Record, for each individual patient ultimately replacing paper records.
- All healthcare professionals connected to a secure health information network supporting integrated community, acute and inter-agency care services.
- Support for integrated healthcare services through sharing of patient information while maintaining the confidentiality of patient information.
- Data sharing between the health service and its partners, based on a framework of informed consent, supporting Community Health Partnership working
- Information systems able to support the three functions of assessment of need: care planning and co-ordination, and evaluation of quality of care.
- Healthcare professionals able to access best practice information and to participate in clinical networks.

- Clinical staff record their interventions directly into Electronic Health Records, rather than transcribe to written records.
- Convergence over the next 5 years towards common and mandatory arrangement of IT systems across NHS Scotland.

With regard to the latter point, it is proposed that a national procurement is undertaken for a new Patient Management System that will embrace both Patient Administration functions plus a kernel of clinical functions that will include at least Order Communications, but may potentially also include A&E, Theatres, Electronic Prescribing etc. The full scope of what will be included is out for consultation.

**b) Projects and Work in Progress**

There are a number of initiatives that are ongoing or have recently been completed within NHSGGC which are closely aligned with the national objectives. These include:-

- Implementation of the national PACS system, commencing in Southern General hospital with subsequent roll out which has included Victoria Infirmary, Yorkhill and progress within RAH and Gartnavel Hospitals.
- Implementation of the national A&E system initially in the Clyde and North Glasgow hospitals.
- Extended availability of the ECS (Emergency Care Summary) to A&E Departments.
- Implementation of the National system for GEMS Out of Hours service.
- Improved resilience and support arrangements for further consolidation of the Laboratory and Radiology Information Systems.
- Implementation of the SCI DC and Diabetic Retinopathy system in Clyde.
- Implementation of the NHSGGC Theatre Management system (ORSOS) in Clyde.
- Implementation of a new Community Nursing System.
- Creation of a stable environment for the Glasgow SCI Store so that services can be restored to GPs regarding provision of laboratory results and other clinical letters.
- Merging of the Glasgow and Clyde SCI Stores.
- Preliminary work on the development of a Data Warehouse to support the Information Services within the enlarged Board Area.
- Continued roll out of SCI Gateway availability for the communication of referral letters from GPs to Acute Care services.
- Continued progress on the usage of CHI throughout the Health Board area.
- Adaptation of existing systems to comply with the requirements of “New Ways of Measuring Wait Times”.
- Implementation of the National Scottish Cervical Call Recall System (SCCRS).
- Implementation of improved communications infrastructure via N3 (NHS Net version 3).
- Rationalisation of the e-mail service within the enlarged Board.
- Commencement of convergence of voice and data communications via IP Telephony.
- Improved CHP connectivity through Boards strategy, joined up services and sharing information.
- Commenced implementation of a Clinical Portal that will facilitate clinical access to the current range of disparate systems.
- Development of Chronic Heart Disease and Stroke electronic Health Records.

- Replacement of Clinical systems within Surgical and Orthopaedics.
- Review of how we can best move to a 24 x 7 support model through internal and external agencies.
- Development of a strategy to support the information requirements for the new Ambulatory Care Hospitals.

**c) Technical and Environmental Infrastructures Required by the New Project to Support the Evolving Information Systems**

In considering the environments required to host a range of modern systems and services, there are a number of standards and facilities that will need to be established.

An IT infrastructure backbone, which will support any software, was considered a key factor in looking at requirements for the new project. The need for cabling, wireless and active communications infrastructure was reviewed along with requirements for telephone infrastructure, computer rooms, IT training rooms, patient internet services and other dependant/related services such as building management and security services interaction with medical/diagnostics equipment, and educational suites and video conferencing application software.

- **Infrastructure**

*Application Software*

Major Application Systems (e.g. PAS / HIS, Labs., Radiology, PACS and other major clinical systems) used within the new hospitals will be part of the National / NHSGGC strategies, and consequently will be funded either centrally or via the NHSGGC IT capital and revenue sources.

*IT Support Services*

IT Support Services will be Pan Glasgow/ Clyde and will be independent of site, therefore the reconfiguration of beds will not affect the support services and any increase in support connected with the roll out of National /NHSGGC software strategies will be funded either centrally or via the NHSGGC IT revenue budget.

*PC and Peripheral Equipment*

The new adult build and children's build will require some investment in PC and peripheral equipment. Although it may be assumed that on ongoing replenishment programme will take place in the coming years, and that it will be possible to transfer a high percentage of the prevalent stock at the time, it is estimated that approximately 10% will require to be replaced at the time of commissioning. Additionally, the configuration of the new builds in clinical areas will require new equipment.

*Active Communications Equipment*

There will be a cost associated with the purchase and installation of the active components of the communications equipment. This will include core switches, distribution switches, wireless controllers, wireless access points, node racks and UPSs.

The PC and active communications equipment is included in the projects cost plan.

# 14. CAMPUS DEVELOPMENT PLAN

## 14.1 THE "DO-ABILITY"

This section describes the current site, the enabling works to release the site designated for the new hospital and laboratory facility, the smaller works associated with the new hospitals and the phasing.

### 14.1.1 Enabling Works

There is a comprehensive plan to re-locate all the services within the site designated for the new build to other locations to allow demolition and clearance of the site by the end of 2009.

Details of both the enabling works and phasing are given in Appendix 7.

The potential for interruption to day-to-day services and facilities within the site during construction has been carefully analysed and will be managed by:-

(a) a series of enabling works to decentralise the main hospital services and utilities and

(b) isolating the construction-site from the remainder of the hospitals, with materials and construction traffic accessing the site from a discreet entrance off Hardgate Road and an existing but currently disused link road to Govan Road.

With the construction-site sealed off and separately accessed from the rest of the hospital site it is envisaged that the hospital will continue to operate uninterrupted during the building and commissioning of the New Hospitals and Laboratory builds.

### 14.1.2 Associated Works

As described under Option 1a there are a series of smaller capital works associated with the Southern Campus. These are:

- Development of two multi-storey car parks. These are to be completed in two phases with an initial car park, phase 1, prior to the main hospital construction to relieve potential parking pressures on the site. The second car park, phase 2, will be constructed alongside the children's hospital build.

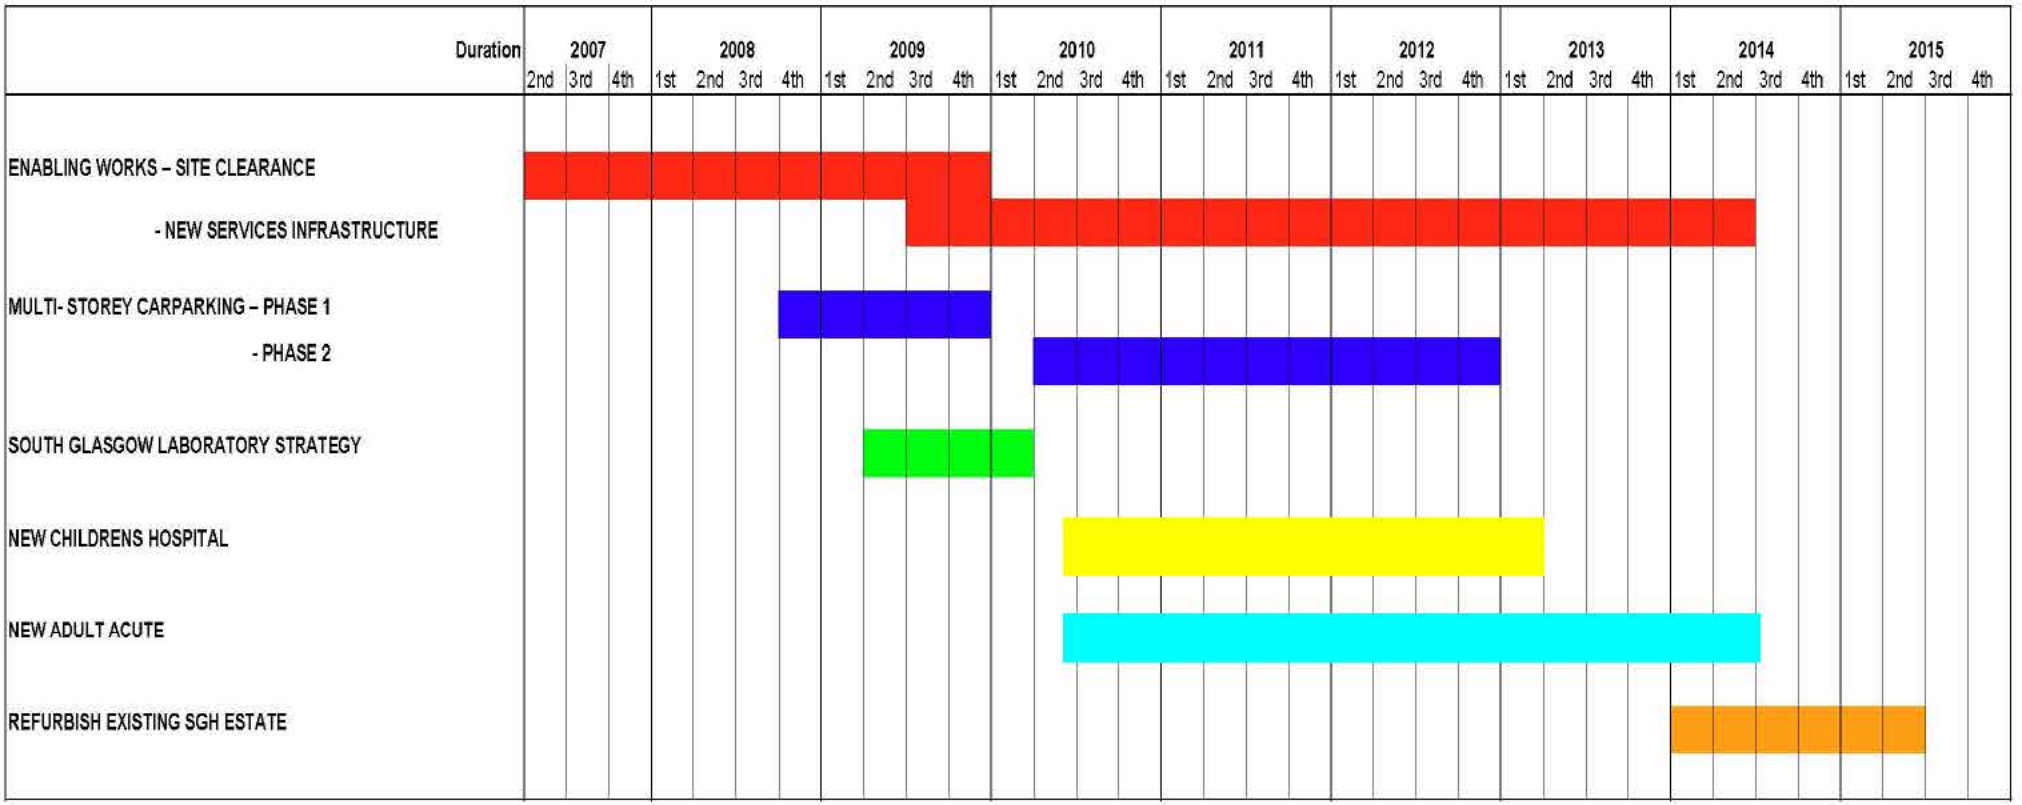
- Refurbishment of some of the existing buildings to provide clinical support and other services

The enabling works, phases 1 and 2 multi-storey car park and the refurbishment of the existing buildings will be funded through the Health Board's capital plan.

### 14.1.3 Phasing Of The Developments

The graph below shows the phasing of the main hospitals enabling and associated works described above.

## NEW SOUTH GLASGOW HOSPITALS
## SUMMARY of PROJECT TIMELINES



In brief, the enabling works to clear the site designated for the new hospitals commenced in the 2nd quarter of 2007. These are part of a rolling programme with completion by the end of 2009.

Work to provide the new services infrastructure to support the new buildings is planned to commence in the second half of 2009 and complete by mid 2014.

The first multi-storey car park, Phase 1, is anticipated to be constructed over a 15 month period from the 4th quarter of 2008. The second multi-storey car park, Phase 2, will sit next to the Children's Hospital and will be constructed during 2010 to 2102.

The new laboratory build construction is anticipated to commence in Spring 2009 with completion the following year in Spring 2010.

The New Children's Hospital construction is planned to take place second quarter 2010 to 1st quarter 2013. The New South Glasgow Hospital is anticipated to take just over four years to complete, commencing in the 2nd quarter 2010 with completion in second quarter 2014.

Finally, refurbishment of the existing estate is planned to commence at the beginning of 2014, and continue for 18 months with completion in mid 2015.

All of these projects will be planned and co-ordinated through the Site Programme Co-ordinating Group, ensuring that all potential risks that may occur in delivering a multi-construction project environment are appropriately managed. Further details about this group are given in the Project Management section (Section 15).

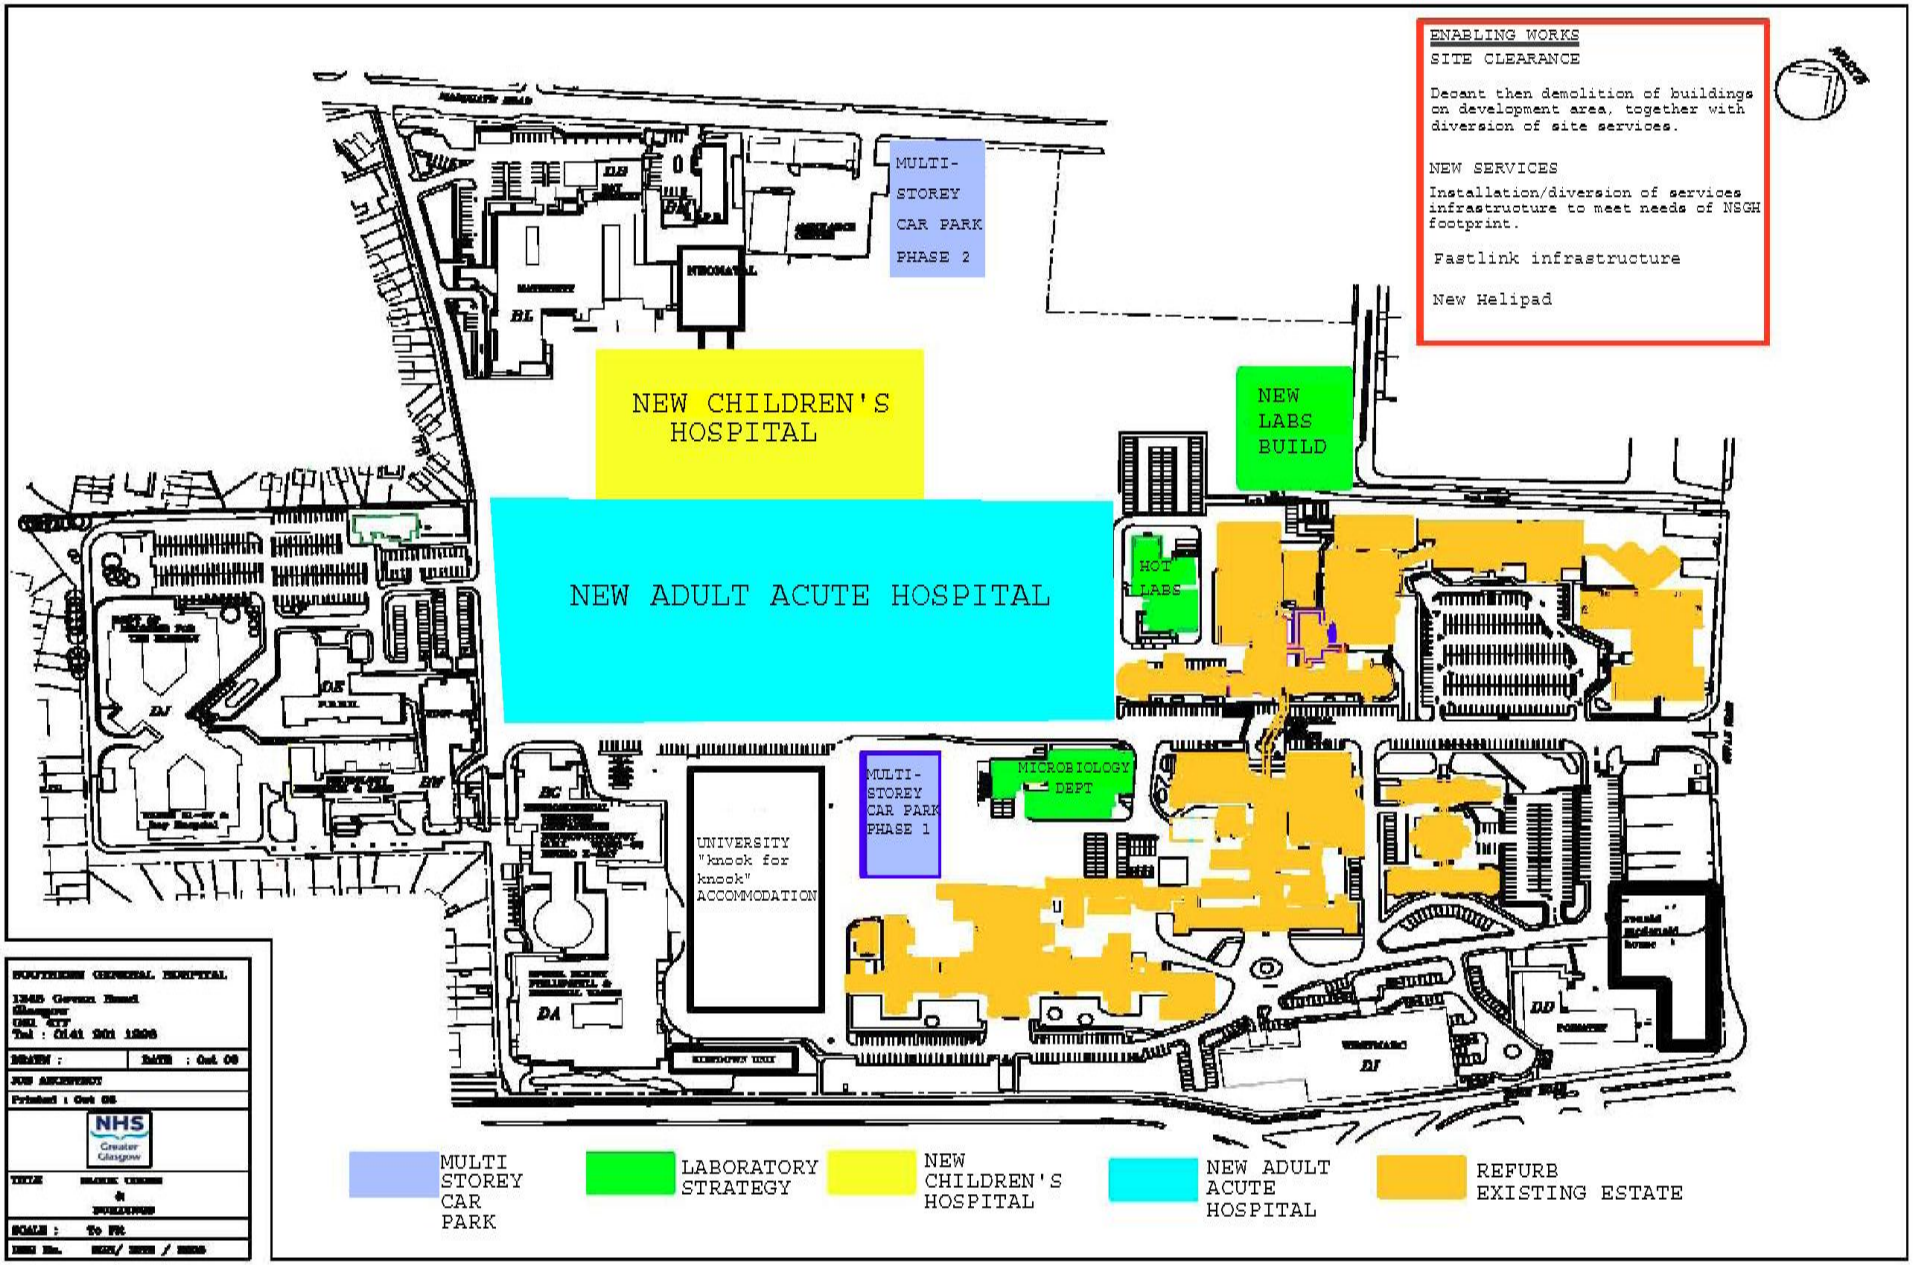
The plan below shows the position of each of the developments on the campus.

The two multi-story car parks are shown in dark blue.

The laboratory build is shown in green and located in the far north of the site, the other green buildings indicate the two refurbished areas providing the hot lab and microbiology.

The site of the adult and children's hospitals are shown in turquoise and yellow respectively.

Finally, the existing estate which will be refurbished is shown in orange.



ENABLING WORKS
SITE CLEARANCE
Decant then demolition of buildings on development area, together with diversion of site services.
NEW SERVICES
Installation/diversion of services infrastructure to meet needs of NSGH footprint.
Fastlink infrastructure
New Helipad
MULTI-STOREY CAR PARK PHASE 2
NEW CHILDREN'S HOSPITAL
NEW LABS BUILD
NEW ADULT ACUTE HOSPITAL
HOT LABS
MULTI-STOREY CAR PARK PHASE 1
MICROBIOLOGY DEPT
UNIVERSITY "knock for knock" ACCOMMODATION
MULTI STOREY CAR PARK
LABORATORY STRATEGY
NEW CHILDREN'S HOSPITAL
NEW ADULT ACUTE HOSPITAL
REFURB EXISTING ESTATE

## 14.2 TRANSPORT

a) Traffic Impact Assessment

A traffic impact assessment has been undertaken in accordance with the guidance contained within Scottish Planning Policy (SPP 17) - Planning for Transport, the results of which have been submitted to Glasgow City Council. A copy of the Transport Assessment and Travel Plan is available from the Board.

In discussion with GCC, SPT, First Bus, Arriva and other transport providers and operators, the Board is planning to improve new and improved bus routes to the site. It will build upon the work undertaken in recent years to improve routage, frequency and quality of bus services. A number of activities that will improve access to healthcare have also been developed with SPT and a five year access to healthcare facilities has been developed.

b) Proposed Clyde Fast Link

Discussions are currently taking place with Glasgow City Council and SPT (Strathclyde Public Transport) to look at options to route the proposed state of the art public transport facility, the Clyde Fastlink, from the city centre, through the Southern General site. To accommodate this, the Campus plan incorporates a dedicated Fastlink route through the site with passenger bus stops at the Adult, Children's and A&E entrances.

c) Travel Plan

A Travel Plan is being developed to outline the Board's Strategy to encourage people to access the site through greener, cleaner travel choices for example, walking, public transport, cycling and car share will be promoted.

The design and layout of the site will improve the ease of access by non-car modes for example pedestrian and cycle routes throughout the site, bus stops near the main entrances, facilities for cyclists such as bike sheds, lockers and showers.

There are 2 multi storey car parks proposed one to service the Adult hospital in the East of the site and on in the west to service the children's hospital.

d) Scottish Ambulance Service (SAS)

The Board has been in liaison with SAS over the proposed changes associated with the campus.

## 14.3 ZONING OF THE CAMPUS AND LANDSCAPING

In developing the campus plan thought has been given to the following:

- Zoning of the site as a whole such that there is separation between the new hospital zone, the FM, labs and energy centre zone and the area around the listed buildings both in terms of the scale of the development and the activities associated with each zone.

- The links through the site and beyond e.g. traffic movement around and through the site, including the separation of public access, service access and emergency access and the establishment of clear way-finding strategy for building entrances, car parks and through traffic. Connection of the site to the surrounding urban fabric both in terms of car access and the fast link.

- The opportunities and constraints of the site, e.g. the land available for build, crucial service co-locations, the creation of a landscape strategy for the centre of the site at the public face of the new hospital and the areas to the rear of the new hospital and the administrative and Academic zone around the listed buildings.

## 14.4 PLANNING APPLICATION

The Outline Planning Application was submitted to Glasgow City Council on 13th April 2007. The application was considered at the Glasgow Planning Committee meeting held on 15th January 2008 and received conditional approval subject to the Section 75 legal agreements.

## UNIVERSITY – FUTURE PROPOSALS

Glasgow University are intending to support the development of the Southern General campus by building an academic centre on the site. This will provide a modern academic facility to support teaching and research. An area of land on the Southern Campus has been identified by the Health Board for this purpose.

A new multidisciplinary Skills and Education Centre is also proposed. Partners in this include the Royal College of Physicians and Surgeons of Glasgow, the University of Glasgow and NHS Education for Scotland. A site adjacent to the new hospitals has been identified as a possible location.

## ART AND WELLBEING

A campus wide art group is being developed to provide and oversee an arts strategy for the campus and new buildings within. It is envisaged that implementation of the arts strategy will be supported through soft funding and will include the following key aspects:-

1. **Core Integrated Art, Architecture and Landscaping**: ambient art and design solutions to reduce anxiety and promote sense of well-being, assist way-finding, in waiting areas, rehabilitation zones, staff rest and dinning areas, car parks, bus shelters, entrances, external landscaping and reception areas.

2. **Special Procurement and commissioning of furnishings**

3. **Provision of programmable spaces**: suitable for exhibition of Creative (Visual Art and Creative writing) and Performing Arts (music, dance, drama and theatre), art and health work.

4. **Provision of specific architectural elements**: for physical and mental rehabilitation e.g. ramps and bridges in courtyards, musical sculptures.

## 14.7 REGENERATION OF THE AREA

The New South Glasgow Hospitals development promotes an opportunity to support regeneration on both the site and across the wider Govan area.

The Board's principal role is as a core health provider but the Board is talking to other partners to ensure the proposals for the Southern site are compatible with other plans for the area.

The Health Board securing Outline Planning Approval for the new development provides other partners with confidence that a critical mass of health provision is coming to the area. The Board is aware of various bodies interested in acquiring space both on and around the site

This includes the potential to work with local housing associations and other providers to explore provision of affordable housing for key workers in the local area and the potential to develop joint working around childcare provision.

The Board also recognises that this development has the potential to contribute substantially to the local economy not only in terms of attracting investment but also through direct and indirect training and employment opportunities. Subsequently, the Board is pro-actively engaged with partners to ensure the development maximises employment and training opportunities.

In addition to the substantial economic benefits to Shieldhall, South West Glasgow and the City, the opportunity also exists to create a new urban centre with its own distinct identity that not only fits within the local context and contributes positively to the immediate physical environment but also takes its place in the sequence of regenerated areas coming west along the river (i.e. Govan Town Centre, Pacific Quay, Science Centre etc) and contributes positively to the emerging townscape along the waterfront.

Further detail regarding the potential of the New South Glasgow Hospitals to contribute to regeneration of the area is given in Chapter 19.

# 15. PROJECT MANAGEMENT

## 15.1 INTRODUCTION

The Board has formally established robust project management structures to ensure that Stage 1 of the project, submission of the Outline Business Case, is delivered within projected timescales, cost and is of high quality.

In planning for the second stage of the project the Health Board undertook a review in August 2007 with input from Partnerships UK. This was to determine additions to the project team structure and governance in recognition of the workload likely to be involved from OBC authorisation to submission of Full Business Case.

The Project Management Structure and governance arrangements for Stage 1 and proposals for Stage 2 are described below.

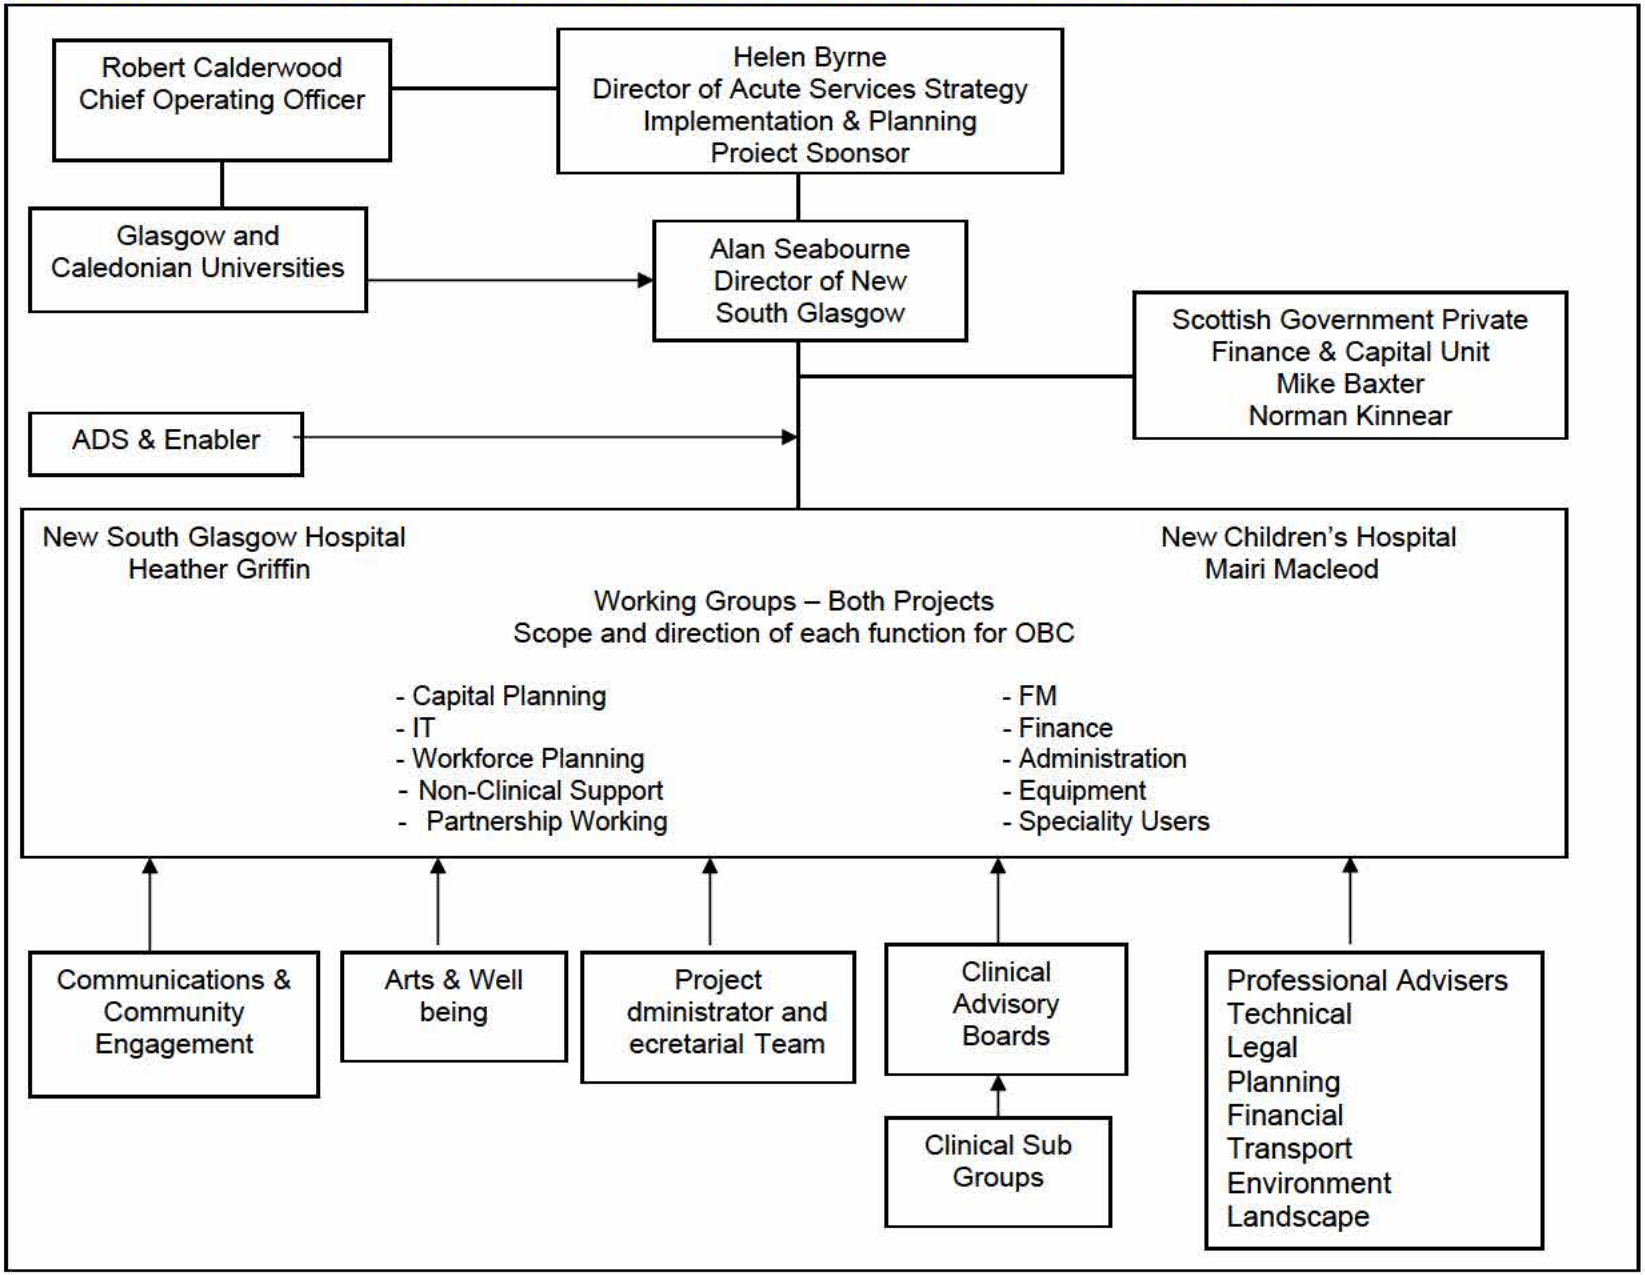
## 15.2 PROJECT MANAGEMENT & GOVERNANCE ARRANGEMENTS FOR STAGE 1

The following diagram shows the key roles and input in delivering the project, these are described over page. Diagram 2 illustrates the structure of the project groups and control mechanisms.

## 15.3 PROJECT STRUCTURE – PROJECT MANAGEMENT ARRANGEMENTS – STAGE ONE

***Diagram 1***

Diagrammatic representation of Project Structure



Project Roles

Within the Management structure outlined above, there are a number of key designated roles. Each of the key roles is defined below identifying responsibilities and reporting mechanisms.

Project Sponsor

The Project Sponsor chairs the Project Executive Group and reports to the Chief Executive of the Board and the ASR Programme Board. (NB the ASR Programme Board is described in more detail later in this section).

The sponsor's role is to:

- Appoint a Project Director to manage the project
- Ensure adequate resources are made available to the project
- Facilitate and resolve difficult issues
- Provide overall internal and external leadership for the project

Project Director

The Project Director reports to the Project Sponsor. The role of the Project Director is to:

- Oversee the component parts of the scheme, these being the new Children's and Adult's hospitals and the new laboratory build
- Oversee the development of the Southern Campus (involving for example development of the University facilities, mental health, crèche, road infrastructure etc)
- Manage stakeholders interests in the project, providing clearness and direction on their behalf, embracing direction from the Project Executive Group (Project Board)
- Appoint consultants and contractors to undertake work within the project budget, and as a direct link to the Board Executive Group, Project Board and all external organisations
- Lead the evaluation of bids and the external negotiating teams up to financial close
- Regularly inform the Project Sponsor and Project Board of the project status and liaise with other external bodice's such as the Scottish Government

Project Managers

The Project Managers report to the Project Director. The scheme has two Project Managers, one to oversee the new Adult hospital and the other to oversee the Children's development. Both work together as a team with shared responsibility for the overall campus and elements within it e.g. pharmacy, university, transport, office accommodation etc.

In more detail the Project Managers role encompasses:-

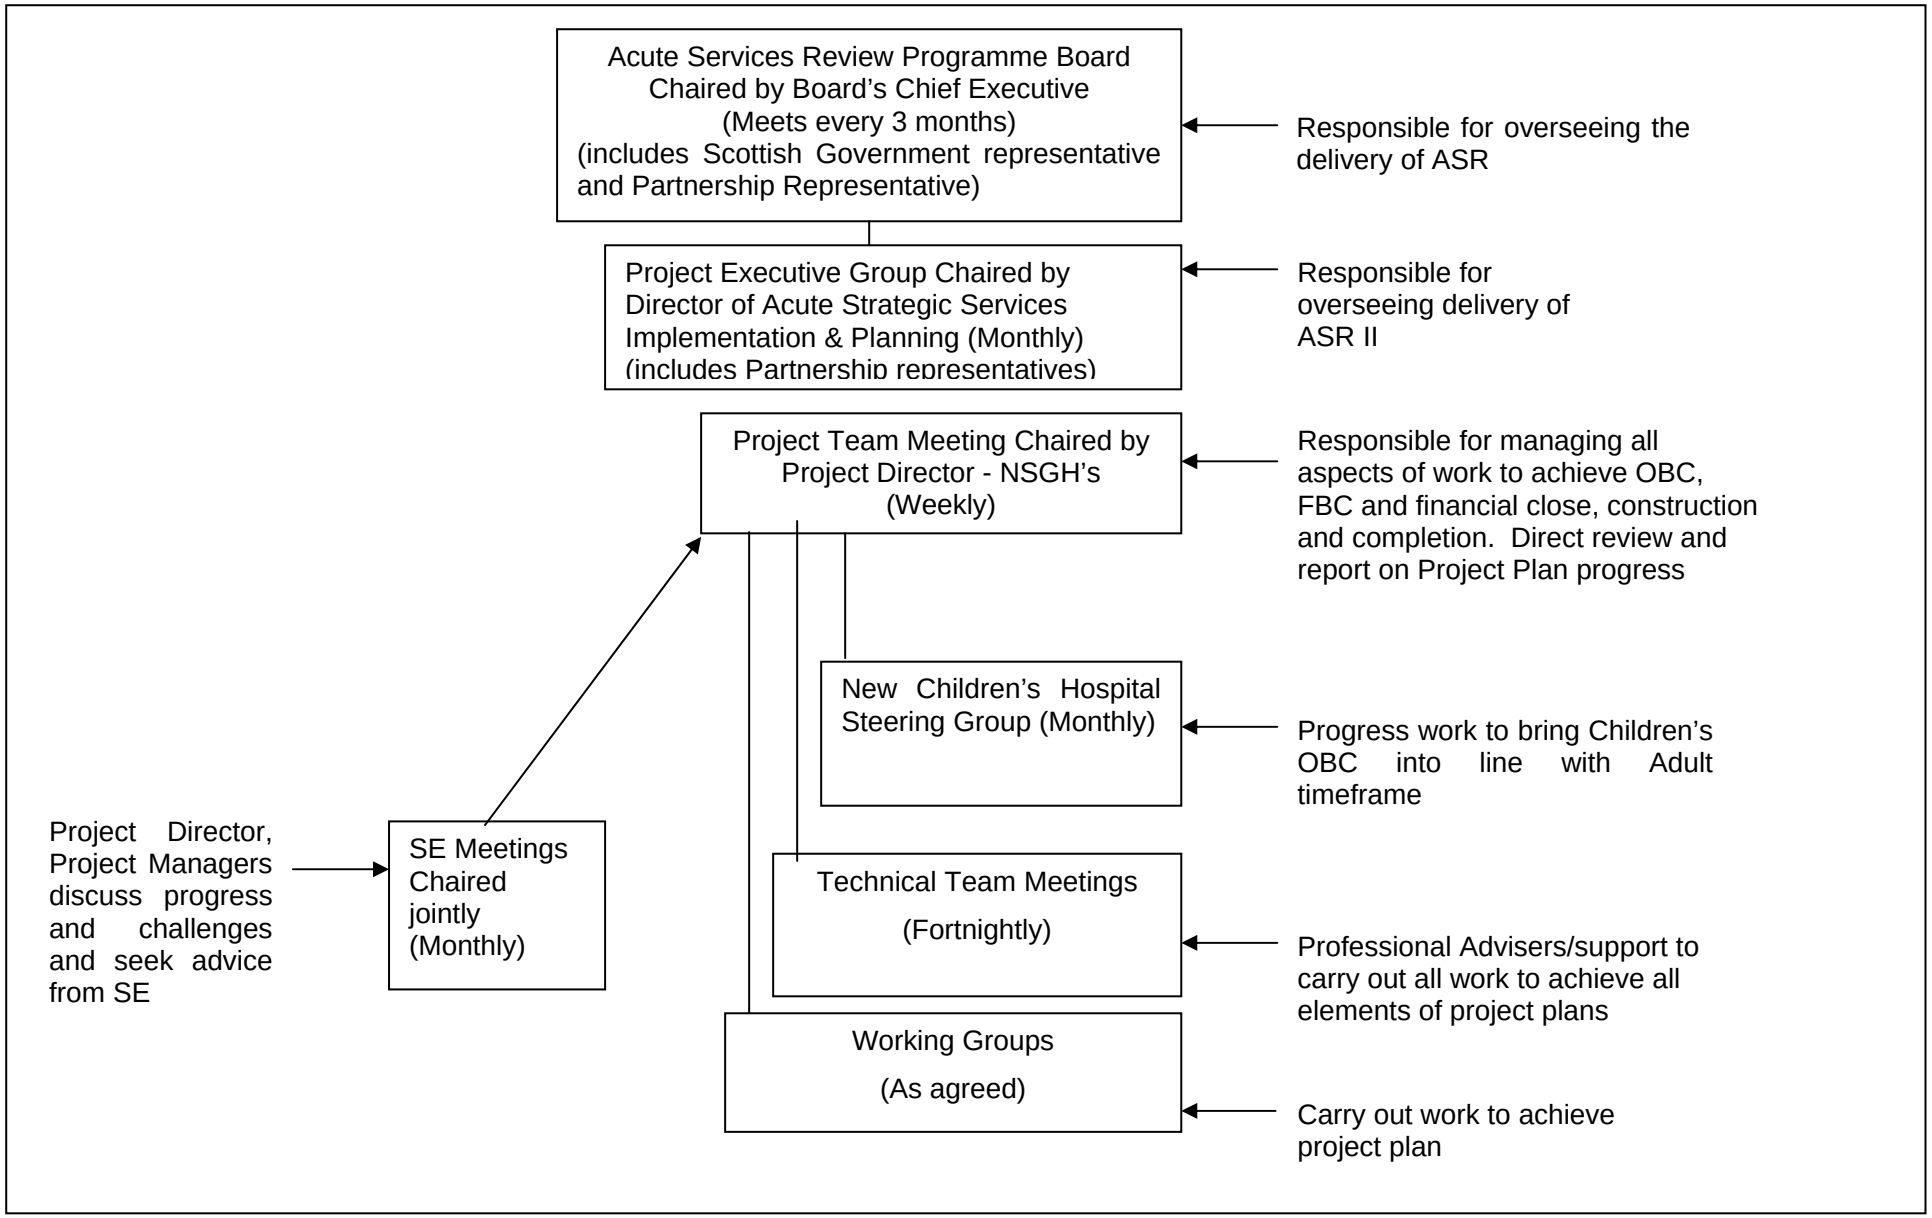
- Preparation of the Project Initiation Document
- Identification of resources required for the Project (skills and cost)
- Recruitment and management of the Project Team
- Management and Leadership of the various clinical sub groups in the development of design brief, Schedules of Accommodation, 1:200's designs and development of the clinical output specification
- Development of the Outline and Full Business Case
- Monitoring progress against the project plan and budget for the scheme
- Oversee project monitoring procedures and documentation
- Report progress to Project Director
- Ensure stakeholder and partnership involvement

Clinical Advisory Boards (CAB)

A Clinical Advisory Board has been established for both the Adult and Children's hospitals. The CAB provides clinical advice and guidance with regards to clinical issues (such as design brief, aspects models of care).

The following diagram shows the structure of the Project Groups and control systems in place for Stage 1 of the project.

***Diagram 2 PROJECT GROUPS IN PLACE FOR STAGE ONE***



Project Executive Group

The Project Executive Group meets monthly and is chaired by the Project Sponsor. Membership of the group includes the Chief Operating Officer, Project Director, Directors of Nursing, Medicine, HR, Acute Director reps and staff side representation.

The role of the Project Executive Group is to:-

- Take responsibility for decision making, strategic vision and leadership
- Approve the project construction document and project plans
- Monitor and approve any changes to the programme
- To determine the most appropriate procurement strategy and co-ordinate the procurement processes to maximise benefits and minimise all associated risks
- Ensure the scheme delivers expected clinical benefits, is robust and offers good public value for money, meets the risk transfer and accounting criteria
- To ensure the necessary senior managers, clinicians and staff maintain regular and on-gong involvement in the project ensuring the necessary ownership at the most senior levels in the organisations
- To ensure integration with other elements of ASR planning and other service plans and developments including national and regional planning

ASR Programme Board

The ASR Programme Board (ASRPB) is responsible for overseeing the delivery of the Acute Services Review. This includes the planning and implementation of the individual elements identified as necessary to achieve the strategic change and also the quantification of outcomes to ensure they are in line with the agreed aims and objectives of the Acute Services Strategy.

NHS HEALTH BOARD

In its role of delivering the overall healthcare strategy for Glasgow, the Health Board will retain the overall decision – making authority. It's role will include:-

- Approval of the Outline Business Case
- Approval of appointment of bidders
- Confirmation of the preferred bidder
- Approval of the Full Business Case (FBC)
- Award of contract

## 15.4 GOVERNANCE STRUCTURE – STAGE TWO, POST OBC TO SUBMISSION OF FULL BUSINESS CASE (FBC)

With the finalisation of the Outline Business Case the project is now coming to the end of Stage 1; the project team have developed proposals for the project management structure to facilitate the next stage, from Outline Business Case authorisation to Full Business Case through the appropriate procurement process.

A review of the breadth of skills and tasks required to complete this stage of the project has highlighted 3 key areas, these being, organisational change and procurement and financial. It is proposed that the generic Project Executive Group be replaced with 2 specialist project groups reflecting the key areas. The 2 groups will feed into a new group, the New South Glasgow Hospitals' Executive Board which in turn will report to the ASR Programme Board. An outline of their remit is given below.

### 15.4.1 The ASR Programme Board

The ASR Programme Board will oversee the project work and progress against the stated outputs and timescale. As described this is an existing group chaired by the Board's Chief Executive. Given that the project is moving forward to stage 2 the terms of reference and membership have been reviewed, these are given in Appendix 19 and 20.

### 15.4.2 New South Glasgow Hospitals' Executive Board

The New South Glasgow Hospitals' Executive Board will have delegated authority to make executive decisions on critical points in the project process. The role of the Board will be to oversee the overall process of the project and to co-ordinate the work streams of the two groups. The Board will meet bi-monthly or more frequently depending upon the stage of the project and will report into the ASR Programme Board.

### 15.4.3 ASR Systems Redesign Group

The development of the New South Glasgow Hospitals will result in a number of radical changes not just in reconfiguring clinical services across Glasgow but also in working practices and the way in which patients receive their treatment. A comprehensive and co-ordinated process will be developed to take forward the re-design aspects and work hand in glove with staff, human resources and workforce planning to ensure both staff involvement and that the right number of staff and skills are available to support the new ways of working.

### 15.4.4 Procurement and Finance Group

There will be a requirement for specialist skills in relation to taking the procurement process forward with regard to the funding, affordability and value for money aspects. A high level of risk management and scrutiny will be needed to assure the Health Board of appropriate delivery.

### 15.4.5 Site Programme Co-ordination Group

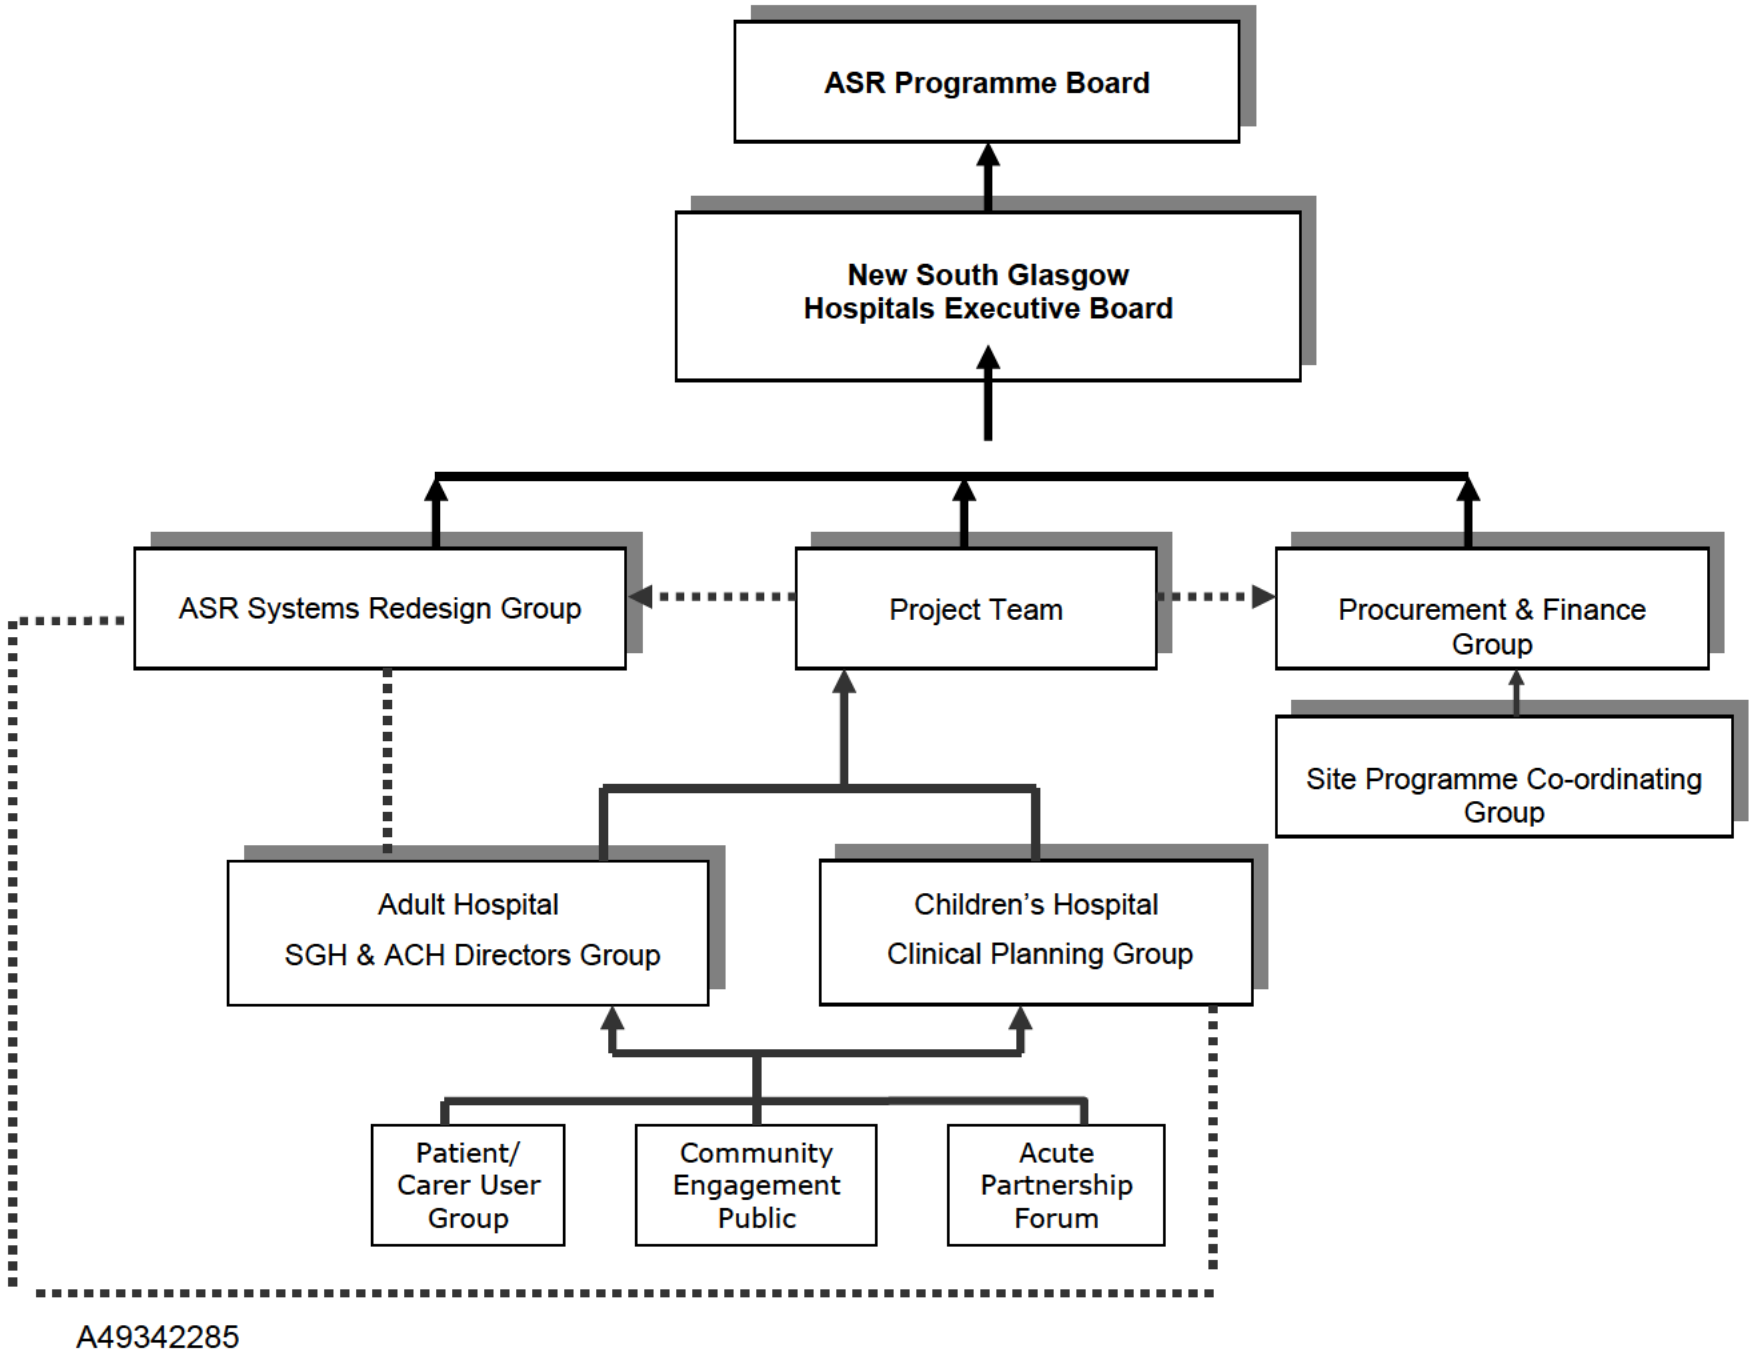
There is a very substantial construction programme planned over the next 6 years at the Southern General Hospital. The site will continue to operate during the full construction programme and therefore there is a requirement to establish a group to monitor, co-ordinate and control all on-site works.

### 15.4.6 Structure, Remit and Membership

Please see Diagram 1 below, which illustrates the project management structure and remit. The remit of each group is given in more detail in Appendix 19.

Membership of the groups will reflect both skills in the specialist area and also previous experience in delivering large capital builds. Membership will also reflect a high level of Board scrutiny in all aspects of delivering this project. Detail of the membership of the main groups is given in Appendix 20.

Governance Structures – Stage 2



A49342285

# 16. LEGAL AND ACCOUNTING ISSUES & ROLE OF EXTERNAL ADVISORS

## 16.1 LEGAL AND ACCOUNTING ISSUES

Legal and financial advisers will provide the Board with guidance on the most appropriate form of contract to meet the Board's procurement strategy. The legal advisers will provide key input into the procurement documentation including the development of the OJEU advert and tender documentation.

## 16.2 ROLE OF EXTERNAL ADVISORS

Various advisors will be required to provide an advisory role to the project. These are most likely to be in the following capacities:-

- Service Specification: To provide healthcare planning advice and manage a process to define service models, departmental and operational policies and to draft output specifications for clinical and non-clinical support specifications.

- Finance and Management Consultancy: To provide specialist corporate finance support to the procurement process together with management consultancy input to secure OBC and FBC approval.

- Design and Technical: The technical team will develop and provide accommodation and building specification for the tender package and help to evaluate the full tender responses.

- Legal: To provide legal support/advice and to deliver contract documentation in line with latest guidance.

# 17 STAKEHOLDER INVOLVEMENT

## 17.1 PARTNERSHIP INVOLVEMENT

Throughout the planning process of the new hospitals there has been a high degree of involvement with staff side through their staff partnership representatives.

The staff partnership are represented on all planning groups including Acute Services Review Project Board (ASRPB), Project Executive Group (PEG), New Children's Project Group and a range of working groups.

The staff are also kept fully briefed through regular meetings with the Southern General Project Team and they have been involved in many of the appraisal and assessment processes.

NHS Greater Glasgow & Clyde Employee Director has also been involved in key debates and discussions through the Board's committee structure.

Presentations on the progress of the new development at the Southern General Hospital have been made to many fora including the Health Board Partnership Forum.

The new governance structure being proposed for the delivery stage of the project culminating in the completion of the Full Business Case (FBC) will have staff partnership members throughout the structure and involved in all discussions and decision making.

## 17.2 COMMUNITY ENGAGEMENT

### OVERVIEW

Following Scottish Government approval of NHS Greater Glasgow and Clyde's Acute Services Strategy in 2002 a Community Engagement Team was established to inform and involve patients and the public in the Acute Services Strategy. The role of the team is to:

- manage public and patient stakeholder involvement in service change and re-design
- ensure patient and public views are central to planning and design structures
- ensure compliance with statutory responsibilities for public and patient participation
- build and maintain relationships with stakeholders
- support the diversity agenda

### COMMUNITY ENGAGEMENT STRATEGY

NHS Greater Glasgow and Clyde's Community Engagement team have put in place a strategy that focuses on three distinct engagement strands. These are:

- the New South Glasgow Adult Acute Hospital
- the New Children's Hospital; and
- the New Hospitals Campus

Two dedicated Community Engagement Managers have been allocated to manage these projects. One is responsible for the New Hospitals Campus and New South Glasgow Adult Acute Hospital while another is the named lead for the New Children's Hospital.

The process has also helped establish the foundations for long term and meaningful engagement structures to ensure the continued engagement of stakeholders and communities throughout the development, build and commissioning phases of the projects.

In brief the following lists the work undertaken under each of these key strands. This is described in further detail in appendices 21, 22 and 23.

***NEW SOUTH GLASGOW HOSPITAL***

- Initial scoping exercise with patients and carers to determine their views on the design of the new Adult Hospital. This exercise involved over 242 individuals and consisted of 6 focus groups, questionnaires and an audit of complaints.
- A series of presentations and inputs into local community organisations including Govan Community Council, Govan Craigton Housing Forum, Greater Govan Social Inclusion Partnership, South Glasgow Business Club.
- Establishment of a Community Engagement Advisory Group for the New South Glasgow Hospital.
- Establishment of a Renal Services Engagement Group to support the redesign of renal services in the new Adult Hospital.
- Participation in local community events including the annual Govan Fair and Govan Gathering.

***NEW CHILDREN'S HOSPITAL***

- Extensive programme of consultation with families, support groups, charities and voluntary organisations - over 150 groups and individuals involved.
- Development of a Community Engagement Advisory Panel with representatives from clinical and nursing staff; the Project Team; Community Health & Social Care Partnerships; family support services; families and young patients to guide the community engagement strategy and to integrate this within the existing PFPI and redesign structures within the Royal Hospital for Sick Children.
- Establishment of a Youth Panel to ensure the needs of young people are included in the design of the New Hospital and a Family Panel to facilitate the influence of families, parents and carers. Training and support is provided to facilitate the work of these Panels.
- Scoping work on the Outline Business Case involved 315 children, young people and families in focus groups, surveys and a photography project. A series of meetings with the Planning and Design teams provided feedback to families, children and young people on how their contribution had influenced the OBC.
- Regular newsletters and a website provide information, communication access to the planning process for a wide range of stakeholders.
- Joint work with children and young people's groups in Govan has begun to build relationships between the Children's Hospital communities and the local community in Govan.
- A network of regional and national perspectives on the new Children's Hospital has been developed and partnerships established with the new Children's Hospital projects in Edinburgh, Queensland and Toronto.

**FUTURE ENGAGEMENT**

The dedicated Community Engagement Managers will continue to lead on a programme of activity with patients, carers and community groups to ensure that their views inform the design, construction and processes associated with the building and services of the new hospitals.

The Community Engagement Team will continue to build and maintain relationships with partners in the city to develop strategic partnerships on key projects that provide additionality to the New Hospitals Campus and support partners wider regeneration objectives. This will include developing strong relationships with Scottish Enterprise Glasgow and the Local Economic Development Companies in developing the economic potential of the Campus and working closely with Land Services and Strathclyde Partnership for Transport to support joint planning around transport.

They will take responsibility for the management of the established community engagement structures ensuing their on-going maintenance and relevance to the planning process.

They will also be responsible for ensuring that the on-going community engagement processes meet Scottish Government guidance and legislation on Patient Focus and Public Involvement and Planning Guidance on Community Engagement, best practice on Community Engagement and, with the support of the Board's Corporate Inequalities Team, championing the diversity agenda.

In line with "Better Health, Better Care" we will use the engagement process to strengthen public involvement in the NHS Services in Glasgow by improving participation in the development of both hospitals and services. This will further strengthen the collaborative and integrated approach to service improvement, building on the work currently being set up in relation to the Ambulatory Care Hospitals.

Hospitals consume over half the total NHS budget and treat 25% of the population every year, in addition they are major employers and businesses within the local economy. The opportunity to maximise health improvement through health promotion, disease prevention and protection is a key aspiration of the new development.

The team will continue to pro-actively meet members of the public who otherwise might not express an interest in the new hospitals via an on-going programme of outreach in public spaces i.e. supermarkets, libraries, community facilities and transport interchanges.

## 17.3 COMMUNICATIONS

Effective communications will be vital throughout the major redevelopment of the Southern General campus.

### 17.3.1 Aims and Objectives

The communications plan will aim to:

- Raise awareness of the plans for the new hospital and the wider redevelopment of the Southern General Campus;
- Build and maintain enthusiasm for the project amongst the local community;
- Ensure staff, patients, the general public and other key stakeholders are kept updated as plans progress – including key milestones and decisions;

- Highlight benefits for patients, staff and the local community – including new or improved facilities and services, economic impact and contribution to the wider regeneration of the Govan area.

The main methods which are, and will be used to keep stakeholders involved are:-

**17.3.2 Internal Communications**

NHSGGC Core Brief – an electronic bulletin, which is used to brief staff across the organisation on key developments, decisions and achievements.

NHSGGC Staff News - the bi-monthly NHSGGC staff magazine, which is circulated to 40,000 staff across the organisation and available online via the intranet. This has already carried several features on plans for the new Southern General Campus.

NHSGGC Intranet - work is underway to create a single NHSGGC intranet that will reflect the new organisational structure and provide a key tool for communicating with staff. Each of the new acute directorates and partnerships will have the ability to populate their own local pages with details of latest news and events, key documents and reports and updates on key projects including the redevelopment of the Southern General Campus.

Staff Briefings – in recognition that there is no substitute for face-to-face briefings, all the above will be underpinned and supported by a regular programme of staff briefings and open drop-in sessions to update staff on the development of the new South Glasgow and Children's Hospitals.

**17.3.3 External Communications**

NHSGGC Website receives around 10,000 hits a month and is currently being redesigned to create a more attractive and user-friendly site. A new section has been created for the Southern General Campus with links to the latest news and information on the two new hospitals and the refurbishment of the maternity unit.

Health News – the bi-monthly NHSGGC newspaper that is circulated as an insert in the Daily Record and widely distributed across Greater Glasgow and Clyde, is a key vehicle for updating patients, the general public and other key stakeholders on the latest health news. It has already carried a series of articles on the hospital modernisation programme and will be used to provide regular updates on the redevelopment of the Southern General Campus as plans progress.

Media Relations – the communications directorate will work with project leads to identify promotional opportunities to maximise media coverage on the redevelopment of the Southern General Campus. To-date there have been major features in the Govan Press, the Evening Times and key business publications. This proactive work will inform the development of an action plan of activities to promote the new hospitals on an ongoing basis. Communications will also explore opportunities to develop campaigns and joint initiatives with key media partners.

Stakeholder Briefings – regular one-to-one briefings with key stakeholders such as local MSPs, business leaders and university colleagues will also be arranged to ensure they are kept updated on the development of the Campus.

# 18 IMPROVING HEALTH & HEALTH INEQUALITIES

NHS Greater Glasgow and Clyde is committed to promoting health improvement and reducing health inequalities.

In planning the new builds, opportunities will be sought to promote health and reduce inequality through the delivery of key actions identified within the Design Action Plan 2007 and the Health Promoting Health Service ASR Action plan 2008. For example, the potential exists to:

- Incorporate a 'shop front' for the voluntary sector, encouraging patients to utilise the range of specialist support and counselling services in cases of disease diagnosis and bereavement.
- Improve the internal and external environment through an arts strategy.
- Create a hub for health promotion services supporting both staff and patients to address health behaviours in relation to smoking, physical activity, alcohol and weight management.
- Define areas of retail space through policy to ensure support for health living through initiatives such as a Fruit Shop, healthy vending options and considering the opportunities presented by community enterprise.
- Maximise the use of facilities where possible for staff and community use through community lets and out of hours access to rehabilitation gyms, staff training facilities etc.
- Promote accessible green space within the hospital design for use by patients and staff including well lit and clearly marked walk ways across the campus
- Develop within the contractual process social economy policies to promote local regeneration through employment and procurement.
- Promote accessibility across the campus through sufficient disabled designated parking spaces and drop-off points closely located to key departments/buildings, ensure provision for on-site transport to help less able patients move across the campus.
- Undertake to develop a broad range of accessible facilities within the building to address the range of patient needs particularly in relation to toilet and bathroom facilities.
- Maximise accessibility through design and input from those living with disabilities.
- Minimise the impact of construction on the environment through consideration of sustainable technologies, waste recycling, renewable materials and renewable energy sources.
- Undertake Equality Impact Assessments through the different stages of the development.

**Benefits**

There are benefits for NHSGGC in developing the Health Improvement Agenda as described above include:

- **Staff benefits** from improved access to services and opportunities.
- **Civic and social benefits** for the local community associated with the role of NHSGGC as a purchaser and employer within the community as well as the role of a community planning partner in social regeneration.

- Evidence based **employer benefits** in relation to increased employee commitment, staff performance and productivity and reduced staff absenteeism and turnover.
- NHS **service delivery benefits** as a wider support is provided for patients to avoid, manage or cope with medical conditions and their implications.

# 19 WIDER SOCIAL ECONOMIC BENEFITS

NHS Greater Glasgow and Clyde secured funding from the following partners to commission SQW consultants to identify potential socio-economic benefits and inform future joint working around the proposed redevelopment of the Southern General site.

- Communities Scotland
- Scottish Enterprise Glasgow
- Linthouse Housing Association
- Glasgow Centre for Population Health
- Glasgow South West Regeneration Agency
- South West Community Health and Care Partnership
- Glasgow City Council – Development and Regeneration Services
- Community Planning

In identifying the potential impacts and anticipated benefits, the analysis focussed on three geographically defined levels, namely:

- the immediate local area of South West Glasgow
- the City of Glasgow
- The Glasgow Metropolitan City Region.

The analysis sought to identify potential benefits at each of the geographic levels in the following areas:

- economic
- human and social
- knowledge
- place

**Economic Benefits**

SQW have estimated that the future service configurations on the Southern General site will have a combined direct, indirect and induced economic impact of between £30 and £40 million on the South West Glasgow economy; between £110 and £140 million on City economy and between £240 and £290 million on Glasgow city region by 2012/13.

The capital projects commissioned to build the new hospitals site will support between 1,300 and 1,700 construction jobs per year for the six years between 2008/09 and 2013/14. Capital projects will support between 260 and 340 jobs per year in South West Glasgow and between 650 and 850 jobs per year in the rest of the City.

**Human and Social Capital**

The New South Glasgow Hospitals development has the potential to impact significantly on the local housing market. Housing providers need to consider future provision and incentives for NHS workers to relocate to South West Glasgow and retain future wage expenditure in the local economy.

Opportunities for training and employment are significant; partners may wish to tailor existing and new training/ employment schemes to meet future labour demands created by the NSGH development.

There exist a number of opportunities that should be explored further with local partners to identify potential joint developments and/ or shared use of local community facilities. For example the potential to work collaboratively with local childcare providers to develop nursery/ childcare provision accessible to NHS staff.

**Knowledge**

The significance of the New Hospitals Campus as a catalyst to support collaboration between academic, public and private sector partners to realise opportunities in research and development, bio-medical and life sciences has yet to be fully articulated, although they are potentially significant at all three levels.

Acknowledging the importance of working at City Region, SQW argue the merits of implementing a focused set of initiatives to fully exploit the benefits from the new co-location of professionals at the NSGH site. They propose that a site specific commercialisation plan is implemented, albeit nested with a wider City Region strategy.

The Southern General development is seen as a catalyst for wider social and regeneration activity contributing to the creation of higher aspirations for the physical development of the local area.

A comprehensive master planning exercise encompassing the Southern General site and the wider area is required. The masterplan should encompass potential development opportunities (including public/ private investment) future land use and public realm works to facilitate investment, connectivity with existing regeneration programmes, linkages and integration to the to the green network and transport infrastructure.

To support this, a comprehensive communication and marketing strategy is required. This should aim to raise awareness of the development and opportunities with partners and communities.

**Partnership Working**

The analysis identifies a number of potential benefits linked to the development of the Southern General site. However, the analysis is also clear that NHS Greater Glasgow and Clyde is not in a position to deliver many of the benefits identified. The potential impact of the new South Glasgow Hospitals Campus will only be realised through effective collaboration between partner organisations. Significant progress has been made in building effective partnerships, for example, with Scottish Enterprise Glasgow in exploiting the economic potential and Glasgow City Council and SPT in identifying opportunities for improving transport and accessibility.

The analysis reinforces the need to maintain this momentum. Therefore, in consolidating existing working relationships and developing synergies with partners planning processes and investment programmes, NHS Greater Glasgow and Clyde will establish a New Hospitals Engagement Forum. This Forum's remit will be to provide strategic leadership, act as a mechanism to inform and co-ordinate partner planning mechanisms, strategies and investment to bring added value to the new hospital projects.

The Community Engagement Manager leading on the campus will service the work of this Forum and is also the Project Team's representative on, or link with, South West Glasgow and Glasgow City working parties and organisations.

# 20. GATEWAY REVIEW

## 20.1 BACKGROUND

The New South Glasgow Hospitals project is subject to Office of Government and Commerce (OGC) Gateway Review. Projects which are commissioned critical or deemed to be high risk projects are required to go through the six stages of the OGC Gateway Review Process.

The review is an independent assessment of the robustness of the business case, that it meets business needs, is affordable, achievable with appropriate options explored and likely to achieve value for money. In doing this, the review outcome highlights whether aspects of the project are red, amber or green (traffic light system).

- Red means that the project cannot proceed to the next milestone until the issues identified as identifies red are addressed.

- Amber means that the recommendations identified must be completed before the next Gateway Review stage.

- Green means that the programme or project is in good shape but may benefit from uptake of any green recommendations to enhance the project.

The Southern General development has completed the Gateway Review Stage 1 which was carried out from 8th to 10th of January 2008. The review was carried out by a review team consisting of 2 Office of Government and Commerce Consultants, and two senior technical NHS Scotland managers. During the three days of the review interviews were undertaken with 18 members of staff including clinicians, senior managers, project team, staff side representatives and finance colleagues.

This is the first time the Office of Government and Commerce Gateway Review has been used to assess a Scottish National Health Project although it has been used in non-health infrastructure projects.

## 20.2 OUTCOME OF THE GATEWAY REVIEW

In their report, the Office of Governance and Commerce Gateway Review Team identify a number of positive aspects about the project and these are listed below.

The review confirms that:

1. The business case is
   - robust,
   - likely to be affordable,
   - achievable,
   - with the appropriate options explored,
   - and likely to achieve value for money.

2. The Project team is well established and has demonstrated an ability to draw on
   - internal skills and experience,
   - other projects throughout the UK.

3. There is considerable internal experience of major project delivery.

4. The Gateway reviewers were impressed by the consistent positive messages on the level of clinical engagement and commitment to new ways of working.

5. Project has maintained close communications with the Scottish Government at all levels.

6. There has been an open and inclusive approach to staff-side communication.

7. The project benefits from significant community engagement through the Community Engagement team.

8. There was an acknowledgment that Community Health and Care Partnerships are engaged.

9. There was recognition of the considerable effort expended in engaging with and developing support from the clinicians affected by the project.

**Recommendations**
The outcome of the Gateway Review was that there were no red recommendations, hence the project may proceed to the Board and the Scottish Capital Investment Group with the Outline Business Case.

There were a number of amber recommendations which were identified as follows:-

**Amber Recommendations**:

- *The project team should ensure that the consequences of delays to decisions are made clear in all communications with the Scottish Government.*
- *The project team should take appropriate time to consider the full implications of a decision to adopt a traditional (design and build) procurement route.*
- *The project team should ensure the communications with staff-side representatives are fully understood.*
- *The project should produce a consolidated risk management register with regular review and reporting.*
- *The project team should review their draft plans for the project governance and management of the next phase.*

**Green Recommendations** - there was one recommendation here which will be fully adopted by the project team.

The five amber recommendations and one green recommendation will be addressed before the Gateway 2 review. Immediate plans include:

- A workshop organised for mid February 2008 attended by the Boards legal and financial advisers supported by a number of technical advisers to determine the optimum conventional procurement model
- More detailed information and communication with staff side representations including continuing with internal meetings between the project managers and staff side, input into the Project Groups and involvement in how information should be more widely communicated to staff.

- Development of a fully consolidated risk register. This will amalgamate the current risk register held by the Project Team, the project risk management strategy (as detailed in Appendix 13) and the technical risk register developed by the technical advisers which focuses specifically on building risks.
- The governance structures for the next phase of the project are being developed with draft proposals reflected in this document which will be subject to revision in line with the preferred Design and Build procurement model which will be identified through an option appraisal at the mid February workshop.

# 21. BENEFITS REALISATION PLAN

The following table summarises how the anticipated benefits of the project, which are detailed in Chapters 4 and 5, will be measured:

| Benefit | Lead Responsibility | Measures | Timescales |
|---|---|---|---|
| **STRATEGIC FIT - CONSOLIDATION OF SERVICES** | Helen Byrne, Director of Acute Services Strategy Implementation and Planning<br><br>Dr Brian Cowan, Medical Director | • Acute Adult Inpatient services consolidated onto 3 sites<br>• Improved co-location of services to support unscheduled care including A&E, Theatres, Critical Care and Imaging<br>• Evidence of specialisation and sub-specialisation models supported 24/7 with specialist cover<br>• Achieve new directives e.g. Modernising Medical Careers.<br>• Reduce the number of medical rotas.<br><br>• Maximises use of dedicated facilities (such as trauma theatres and CEPOD theatres) to deliver targets<br>• Focuses specialist/ experienced staff in fewer sites supporting delivery of most effective care | 3 months post operation<br><br>1 year post operational and annual review<br><br>1 year post operational and annual review<br><br>1 year post operational<br><br>6 months post operational<br><br>Monitored at quarterly intervals to review performance |
| **CLINICAL QUALITY/ CLINICAL SERVICES** | Dr. Brian Cowan, Medical Director<br>Eunice Muir, Acting Nursing Director, Acute Division<br>Rory Farelly, Head of Nursing – Women and Children's Directorate | • Improved occupancy reducing the clinical risks / delays in patient care due to boarding patients out with specialty<br>• Improved HAI rates due to single room facilities and improved space between patients<br>• Appropriate levels of specialist staff to provide and sustain clinical services with 24/7 access to specialist services<br>• Specialist teams working together supporting redesigned services to allow new techniques to be used and developed<br>• New service models supporting the reduction in unnecessary admissions<br>• Patient Safety Initiative input to designing safety issues out of new facilities and | Monitored under commissioning programme and as part of Boards ongoing performance review process. |

| | | | |
|---|---|---|---|
| | | models of service<br>• Improved utilisation of facilities as purpose built with improved co-locations<br>• *Full Benefits Realisation plan to be developed as part of Clinical Transition to identify specific key performance indicators.*<br>• | |
| **PERFORMANCE IMPROVEMENT IN PATIENT SERVICES** | Dr. Brian Cowan, Medical Director<br><br>Eunice Muir, Acting Nursing Director, Acute Division<br><br>Rory Farelly, Head of Nursing – Women and Children's Directorate | • Facilities that support improved ways of working, creating more effective patient pathways to provide timely and fit for purpose unscheduled care<br>• Improved capacity created and waiting time guarantees met within GGC facilities<br>• Waiting time guarantees for inpatient treatment.<br>• Achieve balance between Unscheduled and planned care pathways to safeguard targets being met<br>• Appropriate bed numbers by specialty that support improved occupancy eliminating the requirements to board patients out with the specialty caring for patient<br>• Number of one stop clinics increased.<br>• Reduction in follow-up appointments.<br>• Reduction in the number of cancellation of procedures.<br>• Patient and staff feedback.<br>• Throughput of new patients increased. | One year after fully operational; Annual reviews<br><br>Ongoing monitoring of targets through management information |
| **QUALITY ENVIRONMENT** (meeting patient, visitors and staff needs and meeting building guidelines) | Tony Curran, Head of Capital Planning & Procurement<br>Eunice Muir, Acting Nurse Director – Acute Division<br>Rory Farelly, Head of Nursing – Women and Children's Directorate | • Board Construction Requirements met<br>• Art in Hospital Working Group Objectives met.<br>• Patient and staff feedback.<br>• Health and Safety Record of accidents/incidents related to uneven surfaces etc.<br>• Co-located services ensuring smoother patient pathways | Six months after opening; Annual review processes |

| | | | |
|---|---|---|---|
| **ENVIRONMENTAL CONSIDERATIONS** | Tony Curran, Head of Capital Planning & Procurement<br><br>Eunice Muir, Acting Nursing Director, Acute Division<br>Rory Farelly, Head of Nursing – Women and Children's Directorate<br><br>Alex McIntyre, Director of Facilities | • Board Construction Requirements met<br>• Condition of building surveys.<br>• Art in Hospital Working Group Objectives.<br>• Patient and staff feedback.<br>• FM services monitoring.<br>• Targets for energy consumption met.<br>• Targets for carbon emissions met.<br>• Reduced Health Acquired Infections | One year from operational. Annual reviews. |
| **INFORMATION MANAGEMENT & TECHNOLOGY** | Richard Copland, Director of IM&T | • ICT Strategy Plan implemented.<br>• Improved access to patient information electronically supporting increased continuity of patient care<br>• New systems supporting paper light services | 3 months post completion review as part of Board's ongoing performance review monitoring. |
| **STAFF FACILITIES & STAFF MOTIVATION** | Anne McPherson,<br>Director of Human Resources | • Staff feedback.<br>• Recruitment and retention analysis, lower staff turnover. | One year from operational plus annual performance reviews. |
| **ACCESSIBILITY TO HOSPITAL AND COMPLIANCE WITH TRAVEL PLAN (i.e. decreased journey times to site, less sole car occupancy, improved cycling walking routes with greater uptake of these)** | Tony Curran, Head of Capital Planning & Procurement<br>Eunice Muir, Acting Nursing Director, Acute Division<br>Rory Farelly, Head of Nursing – Women and Children's Directorate<br>Alex McIntyre, Director of Facilities | • Board Construction Requirements met.<br>• Patient and staff feedback.<br>• FM services monitoring of maintenance regime.<br>• Complaints monitoring.<br>• Travel plan monitoring, assessing mode of travel, time taken, experience<br>• Accessibility study – decreased journey times, higher quality travel experience | 6 months post completion review as part of Board's ongoing performance review monitoring. |
| **ENHANCED LINKS WITH UNIVERSITY** | Dr. Brian Cowan, Medical Director | • University academic centre co-located with acute services on the southern General campus<br>• Student feedback<br>• Recruitment and retention analysis, lower staff turnover<br>• Consolidated services better supporting the training of junior staff | 1 year after fully operational |

# 22. POST PROJECT EVALUATION

A post project evaluation (PPE) will be prepared. The appraisal will be complete within 6 months of project completion and before the break up of the design team. The focus of PPE will be the evaluation of the procurement process and the lessons to be learned made available to others. The report will review the success of the project against its original objectives, its performance in terms of time, cost and quality outcomes and whether it has delivered value for money. It will also provide information on key performance indicators.

The PPE review for this project will include the following elements:

## 22.1 PROJECT AUDIT

The project audit will include those elements shown below.

- Brief description of the project objectives
- Summary of any amendments to the original project requirements and reasons
- Brief comment on the project form of contract and other contractual / agreement provisions. Were they appropriate?
- Organisation structure, its effectiveness and adequacy of expertise/skills available
- Master schedule – project milestones and key activities highlighting planned v actual and where they met?
- Unusual developments and difficulties encountered and their solutions.

Brief summary of any strengths, weaknesses and lessons learned, with an overview of how effectively the project was executed with respect to the designated requirements of:

- Cost
- Planning and scheduling
- Technical competency
- Quality
- Functional suitability
- Safety, health and environmental aspects - eg energy performance
- Functional suitability
- Was the project brief fulfilled and does the facility meet the service needs? What needs tweaking and how could further improvements be made on a value for money basis?
- Added value areas, including identification of those not previously accepted
- Compliance with NHS requirements
- Indication of any improvements, which could be made in future projects.

## 22.2 COST AND TIME STUDY

The cost and time study will involve a review of the following:

- Effectiveness of:
    - cost and budgetary controls, any reasons for deviation from the business case time and cost estimates
    - claims procedures
- Authorised and final cost
- Planned against actual cost and analysis of original and final budget.
- Impact of claims
- Maintenance of necessary records to enable the financial close of the project.
- Identification of time extensions and cost differentials resulting from amendments to original requirements and/or other factors.
- Brief analysis of original and final schedules, including stipulated and actual completion date; reasons for any variations.

## 22.3 PERFORMANCE STUDY

The performance study will review the following:

- Planning and scheduling activities.
- Were procedures correct and controls effective?
- Were there sufficient resources to carry out work in an effective manner?
- Activities performed in a satisfactory manner and those deemed to have been unsatisfactory.
- Performance rating (confidential) of the consultants and contractors, for future use.

## 22.4 PROJECT FEEDBACK

Project feedback reflects the lessons learnt at various stages of the project. Project feedback is, and will be, obtained from all participants in the project team at various stages or at the end of key decision-making stages.

The feedback includes:

- Brief description of the project
- Outline of the project team
- Form of contract and value
- Feedback on contract (suitability, administration, incentives etc)
- Technical design
- Construction methodology
- Comments on the technical solution chosen
- Any technical lessons learnt
- Comments on consultants appointments
- Comments on project schedule
- Comments on cost control
- Change management system
- Major source(s) of changes/variations
- Overall risk management performance
- Overall financial performance
- Communication issues
- Organisational issues
- Comments on client's role/decision-making process

- Comments on overall project management
- Any other comments

It is the intention that the project feedback not only identifies what went wrong and why, but also highlights what has been accomplished and if (and how) that can be improved in future projects.

## 23. TIMETABLE

A detailed project plan is shown in Appendix 24 and is summarised in the table shown below.

Please note that these timescales are indicative and will be reviewed following the Procurement Workshop to be held on 19th February 2008. As described the outcome of the workshop will be to determine the preferred conventional procurement model.

The contract form will dictate the timescales for following tasks and timetable. However it is anticipated that, following market sounding and preparation of more robust design and project requirements (brief and specification), a competitive process will follow involving at least three contracting teams over a 9-12 month process, culminating in the selection of a preferred partner completion of Full Business Case by mid 2010. The detail of the process will be expanded on completion of the workshop and confirmation of the preferred route.

The outcome of the workshop will be submitted to the Health Board and Scottish Government for approval and will be independently assessed though the OGC Gateway Review process to provide assurance to the Board and the Scottish Government that the method shown has been scrutinised and confirmed.

Table 17: The indicative timescale is as follows:

| **Description** | **Target Date** |
|---|---|
| Outline Planning Approval | January 2008 |
| Gateway Review | January 2008 |
| Final OBC to NHS Greater Glasgow & Clyde Board | 19th February 2008 |
| Final OBC considered at Scottish Government Capital Investment Group | 26th February 2008 |
| Submit OBC to Cabinet | March 2008 |
| Final OBC Approval | April 2008 |
| Full Business Case Submission | 2nd quarter 2010 |
| Construction Starts | 2nd quarter 2010 |
| Completion – Children's Hospital | 1st quarter 2013 |
| Completion – Acute Hospital | 2nd quarter 2014 |

Prior to placing an OJEU advert a number of tasks will be undertaken in order to optimise the marketability of the scheme. These are as follows:

- A market sounding exercise will be undertaken.
- Matching of clinical and non-clinical output based specifications to design
- Development of a Memorandum of Information (MOI) to act as a project summary and brief for potential bidders
- Formal presentations to potential bidders

# 24. CONCLUSION

This Outline Business Case presents the proposals for a new integrated Adult and Children's Hospital. The proposals represent the largest investment in health services undertaken in Scotland and form a key part of the NHS Greater Glasgow & Clyde's Acute Strategy to modernise health services.

# Appendix 3
# Key Milestones of the Acute Services Strategy

# APPENDIX 3 – Key Milestones of the Acute Services Strategy

| Date | Milestone |
|---|---|
| 1999 | Health Boards approval of the Maternity Strategy to reduce the number of delivery units in Glasgow from three to two. |
| 2000- end of 2001 | Public consultation on the rationalisation of services to 3 acute inpatient sites. |
| April – June 2001 | Public consultation on specific proposals to strengthen clinical capacity at the Victoria and Southern sites. |
| June 2001 | Public consultation regarding changes to the smaller specialties:- ENT, Gynaecology, Urology, ophthalmology. |
| January 2002 | Health Board approval for the Acute Services Strategy |
| September 2002 | Ministerial approval for the Acute Services Strategy |
| 2003- 2004 | Pre – consultation and public consultation of the detailed plans within the Maternity Strategy |
| September 2004 | Ministerial agreement on the Maternity Strategy and the decision to provide triple co-location of paediatric, maternity and adult services |
| February 2005 | Retesting and confirmation of the A&E model by the Health Board |
| June 2005 | Health Board agreement on the Pan Glasgow bed model |
| March 2006 | Report and Recommendations of the Clinical Advisory Group appointed by the Minister for Health and Community Care |
| Spring 2006 | Ministerial decision to co-locate the New Children's Hospital with obstetric and other adult services on the Southern site. |
| 2005 - 2006 | Presentation to the Health Board of work carried out by the Bed Services and Capacity Subgroup regarding the disposition of Cardiothoracic surgical services and investigative and interventional cardiology and the disposition of smaller specialties and sub specialties. These were: Vascular surgery, colorectal surgery, upper gastro-intestinal surgery, breast services, renal, Ear Nose and Throat (ENT) services, ophthalmology, dermatology and pathology. |
| 2002-2006 | Progress in implementing the Acute Services Review:<br>The New Beatson West of Scotland Cancer Centre build complete and commissioned 2007<br>New Victoria and Stobhill Hospital – financial close in summer 2006. To be commissioned 2009<br>Work begins on developing the OBC for the New South and New Children's hospitals. |

Further detail about these milestones can be found in the 'Clinical Strategy for Glasgow's Acute Services 2006/07 – 2013/14.

# Appendix 5
# Aerial View Showing the Boundaries of the Site Pan Glasgow Bed Model

## APPENDIX 5 – Aerial View Showing Boundaries of the Site

# Appendix 6
# Pan Glasgow Bed Model

## APPENDIX 6 - Pan Glasgow Adult Bed Model

### 1. Background and Context

1.1 In July 2005, a paper from the Beds, Services and Capacity Subgroup was submitted to the Board which set out the planning assumptions for the inpatient bed numbers to underpin the capital procurement and service planning for the Acute Service Review. The subgroup had been established to pull together the programme of work to conclude the final siting of inpatient services and the scale and clinical design of the new inpatient facilities. The aim of the paper was to support the establishment of a process to debate its conclusions and inform the final proposals on the bed numbers.

**2.** At that time, it was recognised that the bed numbers would be subject to further iterations as outline business cases were developed and worked through to final business case.

2.1 Work has continued since that time in updating the efficiency projections with CHKS. More recently, work has taken account of the need to address waiting times targets introduced since the earlier work was undertaken, in addition to as the requirement to deliver ASC codes.

### 3. Process

3.1 This section describes the processes undertaken to arrive at the proposed Pan Glasgow adult inpatient bed numbers based on 2005/6 activity.

3.2 Two processes have been in train to continue the work in relation to the bed model:

- The first process has continued with the previous work through CHKS, modelling the efficiencies as well as the additional factors of 5 day beds, demography, activity growth, waiting times, ASC codes. In developing the latest iteration of the bed model, the 2005/6 CHKS position was obtained for the inner city peer, which enabled refreshment of the model in relation to further improvements in the efficiency parameters to apply to Glasgow's data.
- The second process was established in response to the audit report on the bed model by Price Waterhouse, which recommended that independent work to validate the bed model be undertaken. To achieve this, ISD was commissioned to work with the Head of Acute Service Planning and the Directors for Emergency Care and Medicine, and Surgery and Anaesthetics to consider the bed requirements

3.3 In undertaking this work, the conclusions of the previous work of the Beds, Services and Capacity Subgroup in relation to the number of sites and the clinical service requirements and relationships remain as the extant position.

## 4. Bed Number and Adjustments

4.1 For the proposes of this paper, the starting point for this work was the July 2005 inpatient bed model agreed by NHS Greater Glasgow Board. In comparing the baseline then to the current baseline position (as set out in table 1 below), it would suggest an overall increase in beds since that time. This reflects the renewed focus to capture the information on the current bed numbers more accurately and also agreed bed changes in recent years. This was undertaken initially in December 2006 and has been reconfirmed in November 2007.

4.2 Table 1 identifies the current baseline for the bed model, against the July 2005 baseline.

*It should be noted that this table excludes Obstetrics, Paediatrics and Elderly Continuing Care as these specialties are being progressed under extant strategies.*

**Table 1. November 2007 baseline comparison to July 2005**

## 5. Principles Agreed

5.1 In revisiting the bed model it was agreed that work should be updated and 2005/6 outturn considered against the inner city peer.

5.2 The key principles applied to the bed model are as follows:

- Benchmark comparators – CHKS 2005/6 performance of the Inner City Peer against Glasgow activity considering the efficiency drivers **of day case rates and length of stay** – see Tables 2 and 3.
- If Glasgow's performance is better, then it will be used instead of CHKS indicators.
- Actual Activity Outturn for 2005/6 has been used to develop the bed number.
- The occupancy rate used – 82% for emergencies
  85% for elective.
- Demographic Change: The population of Glasgow will change over the next 10 years and impact on the hospital services. The impact of this has been factored into the model.
- Emergency Activity Growth: Previous work has agreed the growth rate within emergency medicine at 0.7%. This has been assumed for the purpose of the current modelling.

5.3 The day case comparison rate is set out in table 2.

**Table 2. Day Case Rate Comparison**

| **Specialty** | **2005/6** | | |
|---|---|---|---|
| | **Actual %** | **CHKS%** | **Difference** |
| General Medicine | *65.1* | *79* | *-13.9* |
| Cardiology | *62.3* | *66* | *-3.7* |
| Infectious Diseases | *92.2* | *94* | *-1.8* |
| Gastroenterology | *99.3* | *99* | *0.3* |

Figures have been adjusted to remove cardiology and CCU beds transferred to GJNH

*N.B. In considering the above it is expected that some of the inpatient bed capacity will be reprovided in the form of increased day case facilities to support the transfer of activity to day case treatment. This will be considered and factored into the financial model in terms of affordability.*

5.6 In considering the revised the bed model position in relation to 2005/6, the number of beds currently being projected indicates an increase from the proposed bed model in the July 2005 paper. To set this in context it is important to remember that the 2005/06 bed number supports the additional waiting times activity, the delivery of the ASC codes and the GJNH activity not previously included in the bed model. It also includes an adjustment to the occupancy level to accommodate the variation in emergency admission to meet A&E waiting time targets. As mentioned previously, this is an iterative approach and work is currently underway to assess the implications of the bed model using 2006/07 data.

5.7 In considering the physical design and space requirements it is important that the following potential developments identified in bed models previously projected by Greater Glasgow are highlighted at this stage. These developments are identified in table 5 below.

5.8 Table 5 sets out developments identified as part of previous service modelling. Funding has not yet been identified for these developments.

**Table 5 – Proposed service developments**

| | | | | | |
|---|---|---|---|---|---|
| **HDU development** | | **8** | **+8** | **10** | **+10** |
| **ITU development** | | **10** | **+10** | **7** | **+7** |
| **Nephrology development** | | **14** | **+14** | **15** | **+15** |
| **Total incl. developments** | | **32** | **+32** | **32** | **+32** |

A49342285

It should be noted that the bed modelling work is an iterative process and, it is intended, will be updated with the 2006/7 benchmarked position, which is currently being explored to consider the further level of efficiency that could be implemented. It will be necessary to continue this work in the months and years ahead to ensure a continued focus on efficiency.

5.9 The Pan Glasgow bed Model was used as a basis to derive the high level bed numbers, for planning purposes, for the New South Glasgow Hospital. The following describes this process in more detail.

Specialities highlighted in the Clinical Strategy as being centralised onto the Southern site include ENT, Vascular, Clinical Haematology, Dermatology and Nephrology. The number of beds required for each specialty was derived from the Pan Glasgow bed model.

Where a specialty was spit between two sites it was assumed that elective work would reflect the expected flow from the respective Southern and Glasgow Royal catchment areas. It was assumed that the emergency work would be split 50/50 given the equal sizing of the A&E at Glasgow Royal and New South. In reviewing each specialty any known subspecialty deviations from asumptions was taken into account, for example within general surgery all breast surgery will be centralised at Gartnavel General while complex pancreatic work will be undertaken at Glasgow Royal. Where specialities were split between three sites the catchment area was used as a guide.

The assumptions resulted in a percentage split of beds north and south using the Pan Glasgow bed model to derive the bed numbers.

The resulting bed split and bed numbers were discussed and agreed with the Chief Operating Officer for Greater Glasgow and Clyde Hospitals and also presented to the Health Board.

The bed numbers will be further reviewed during the second stage of the project - development of the Full Business Case.

# Appendix 12
# Outline Business Case for the Labs Development

# Appendix 13
# Risk Management Plan

## Appendix 13 Project Management Risks - Table To Show Risk Management Strategy

| Risk | Description | Consequence of Occurrence | Risk Management Policy |
|---|---|---|---|
| **Design and construction risks** | | | |
| 1. Unavailable site | Risk of unavailability of suitable site – i.e. unable to clear identified site | Unavailability of site would delay the start of build and add to the project costs. | The planned site (Southern General) is identified and owned by the Health Board. There is a comprehensive plan of enabling works to allow the site to be cleared in 2009. The plan has been shared and is supported by relevant stakeholders. |
| 2. Planning Permission | Risk of failure or delay to obtaining outline planning permission. | Going out to market without planning permission would decrease the potential attractivenesss of the scheme therefore reduce the potential number of bidders | The Health Board is liaising regularly with the City Council. The risk components of the planning submission have been identified and are being managed by the Project Team on an ongoing basis.<br><br>Conditional approval subject to the Section 75 legal agreements has been received. |
| 3. Inadequate design | Design brief not adequate to allow the planning of a facility which meets the desired clinical and functional needs. | Inappropriate design would result in changes and therefore delays and cost to the project. Poor spec would also make the project unattractive to the market | There is ongoing involvement and input of users to ensure the brief is both detailed and meets user/clinical needs. |
| 4. Failure to design to brief | Failure of design team to translate the requirements of NHSGG&C into the design | Failure to design to specification would result in changes and delays to the build | There will be on-going involvement of users in the design and evaluation of bidders and close monitoring of the design process by the Project Team |

| Risk | Description | Consequence of Occurrence | Risk Management Policy |
|---|---|---|---|
| 5. Change in requirements of stakeholders | Risk that Board and/or stakeholders may require changes to the design e.g. legislative or regulatory requirements specific to the NHS. | May lead to additional design and building costs and a delay the timetable | The Health Board will minimise the use of variation orders once the contract has been awarded. It is envisaged that the specification will be well developed prior to issuing any briefing documentation. Any known potential change in legislation will be taken into account within the output specification.<br><br>Already considered current clinical reviews which may create design changes. |
| 6. Ground Conditions | Unforseen ground site conditions | Potential to delay start of build causing increase in project costs | The Southern General Estates team have undertaken a thorough survey of ground conditions to minimise the risk of unforseen ground conditions |
| 7. Cost estimates incorrect | Costs incurred to complete the project may be different from that estimated. E.g. Market prices differ from surveyor estimate. | Cost of the project increases. | Cost estimates QS have been confirmed through independent checks. |
| 8. Timetable – The Project will be delivered within acceptable timescales | The project is delayed. | The new hospitals are not constructed and commissioned within stated timescale adding to the cost of the project | Project timetable has been developed in liaison with technical, financial legal advisers. Also taken soundings from construction companies.<br><br>Careful monitoring of the project timetable against progress will be needed. The Project Team will be working in close liaison with the organisations involved in the delivery of the new hospitals therefore any deviation from the timetable will be flagged up at an early stage with corrective action taken where possible |
| 9.Equipment costs | Risk that equipment costs are greater than anticipated | The cost of the project increases | Procurement department have been involved in the project and costings from an early stage and will have an ongoing input thus reducing the risk of equipment costs. |

| **Capacity and Demand Risks** | | | |
|---|---|---|---|
| 10. The activity assumptions are correct | The activity is greater/less than stated | The building and equipment is under or over capacity | A detailed audit of activity and bed requirements was undertaken and reviewed by CHKS to project bed requirements into 2014. This has been discussed with/agreed with Directors.<br><br>Audits of A&E activity have been under-taken as has modelling of theatre requirements and utilisation. The Health Board will continute to monitor activity and other aspects such as waiting list activity and ensure a continuing match with the planned facilities on the Southern site and across Glasgow. |
| 11.Incorrect time and cost estimates for commissioning | Delay in handover | Impact upon clinical services with additional operational costs e.g. double running costs. | The Health Board will develop a detailed commissioning plan as the project progresses. This will be integrated into the overall project plan and key messages to stakeholders communicated. |
| 12. Service continuity will be maintained both prior to, and during the build and service relocation | Disruption to continuity of the service | Cancelled operations, disruption to patient services and failure to meet waiting time targets. | A detailed enabling plan has been developed by the Southern General Estates team to minimise any disruption to the operational clinical services on site. In addition the area for construction will be sealed off with the creation of a dedicated route for construction traffic into the site. The schedule of service transfer will be designed to ensure an orderly and effective transfer with minimum disruption of clinical service. There will be close communication with users both before, during and immediately after the transfers. New governance arrangements for delivery stage see the establishment of a site co-ordinating group who will directly control all programmes. |
| 13. HR Issues associated with relocating staff will be managed | Staff morale falls due to raised anxiety over the change | Increase in turnover; difficulty in recruiting, low motivation leading to deterioration and disruption in service | Full time staff representatives are members of the ASR Programme Board and Project Executive Group. The benefits of the project will be highlighted e.g. better workng environment, fit for use facility<br><br>Nearer the time of build it is planned to develop a Human Resource sub – group with full time staff representation to address staffing issues, keeping staff informed and encouraging ownership of |

| | | | |
|---|---|---|---|
| | | | the change through involvement with Work Groups planning the commissiong of the building and new services. |
| **Other Risks** | | | |
| 15. Transitional costs | Costs are greater than stated. | Unfunded cost pressure | Transitional costs have been calculated drawing on the experience and outcome of a number of large capital projects around Glasgow NHS eg maternity new build at GRI, A&E build ( GRI) and West of Scotland Cancer centre phases 1 and 2. |
| Risk that IT costs are inaccurate | Actual IT costs are higher than stated | Additional unfunded cost pressure | IT Department input has identified likely IT costs for the project. IT will have an ongoing involvement in reviewing costs between OBC and FBC. |
| The predicted sales proceeds from the vacated sites are assumed to be accurate | Actual sale proceeds are lower than stated | Lower than predicted sales proceeds will introduce a cost pressure to the Board and overall affordability of the project | A prudent approach has been taken in the estimates of the sale proceeds |
| The revenue savings/costs are realistic.<br><br>Revenue savings/costs | The revenue savings/costs are realistic | The actual revenue savings are lower than anticipated | The Board will conduct a vigorous review of savings to ensure that they are achieved. |
| **Capacity and Demand Risks** | | | |
| Other approvals required | Sign off of Children's Hospital of West Scotland Health Boards | Delay in sign off leading to delay and incrrease in the cost of the project. | The Board is in close liaison with the WofS Boards ensuring key aspects and costs of the project are communicated. Any points raised by the WofS Boards are being taken into account and liaison is ongoing. |
| Energy usage and greenhouse gas emissions | Risk of increase in energy usage and inability to meet gas emissions targets. | Energy costs rise and greenhouse gas emissioning targets are not met resulting in increased global warming. | Monitoring of energy usage and costs, training staff in energy efficient working practices. Increased use of renewable energy services. |

The Project Team considers effective risk management to be an integral part of successful project management. The development and implementation of risk management policy is considered an on-going process and the Project Team will continue to monitor the project, with its advisers and partners, for new risks and ensure that action is taken to address each risk appropriately.

# Appendix 19
# Project Management Structure
# - Remit of Groups

**APPENDIX 19**

## 1) ASR PROGRAMME BOARD

### Role and Remit

The ASR Programme Board (ASRPB) is responsible for overseeing the delivery of the Acute Services Review. This includes the planning and implementation of the individual elements identified as necessary to achieve the strategic change and also the quantification of outcomes to ensure they are in line with the agreed aims and objectives of the Acute Services Strategy.

The ASRPB will ensure that all activities are in line with agreed principles and timescales. The ASRPB will receive updates regarding all aspects of planning and implementation of the Acute Services Review.

The ASRPB will ensure that the strategic direction is reviewed and confirmed as still appropriate (in line with Gateway 0).

The ASRPB will consider the wider implications of implementing the Acute Services Review including: the impact on local communities; providing direction and advice on liaising and working with the many interested parties, maximising local benefit through advocating good community planning processes are adhered to and ensuring that political sensitivities are managed appropriately.

The ASRPB will ensure the necessary linkages to delivery between elements of the strategy are being dealt with.

The ASRPB will ensure overall financial control is being managed and is kept within the parameters of the Board's expenditure.

The ASRPB will approve and monitor the appropriate governance is in place to ensure a successful outcome for each major element of the Acute Services Plan.

The ASRPB ensure that the performance of all aspects of planning and implementing the Acute Services Review is monitored and progressed at the appropriate level for a successful outcome.

The ASRPB will consider and approve specific aspects/proposals of the planning and implementation process to the agreed level of delegation.

## 2) NEW SOUTH GLASGOW HOSPITALS EXECUTIVE BOARD

### Role and Remit

The New South Glasgow Executive Board (NSGEB) will ensure that all activities of the Organisational Change Group (OCG) and Procurement & Finance Group (PFG) are co-ordinated and achieving the appropriate progress.

The NSGEB will have appropriate delegated authority to take forward necessary negotiations to ensure objectives are achieved, progress is maintained and business is concluded especially where time is critical to the ASR2 viability with respect to financial aspects and the implementation programme.

The NSGEB will report and advise the Acute Services Review Board (ASRPB) on all aspects of the implementation of ASR2.

The NSGEB will monitor all aspects of performance of the implementation of ASR2.

The NSGEB will provide change management control in that any change which impacts upon the project must be authorised by this Board before it can be implemented.

The NSGEPB will meet regularly (every 2 months) to assess programme progress. The NSGEPB will also meet as often as necessary when critical factors that may be detrimental to the progress of implementation of ASR2 require to be addressed.

## 3) ASR SYSTEMS REDESIGN GROUP

**Role and Remit**

The ASR Systems Redesign Group will oversee the impact of implementing the Acute Services Review (ASR) on the whole organisation and drive forward the service transformation programme which will include changes in activity, models of care and new ways of working.

As the project progresses the remit of this group will evolve from a strategic clinical redesign focus to a more operational focus. On this basis it is proposed that the chair will change to reflect the evolving remit. The ASR Systems Redesign Group will ensure that external and internal stakeholder involvement is at the heart of planned change and that a development plan for staff is fully supported and implemented to enable change to happen appropriately.

The ASR Systems Redesign Group will report to the New South Glasgow Hospital Executive Board and be accountable for ensuring a fully co-ordinated approach is adopted to completing the work to achieve the objectives of the ASR.

The ASR Systems Redesign Group will approve and commission all aspects of clinical/service redesign in order to provide assurance to the ASRPB that the programme of transformation and change is on target and achieving agreed objectives.

The ASR Systems Redesign Group will monitor the stakeholder management plan to assure it interfaces with the following organisations and manages these links appropriately.

- Scottish Government
- MP's/MSP's (Local politicians)
- City Council Members and Offices
- Town Planning/Heritage Groups/Architect and Design Scotland
- Neighbourhood Groups
- Patient Groups
- Local/National media, safety and sustainability

The ASR Systems Redesign Group will approve or make recommendations to ASRPB all aspects of

- Clinical Output Specs
- User Interface
- Bid Evaluation – (Service Based)
- Assure clinical functionality, safety and sustainability

## 4) PROCUREMENT AND FINANCE GROUP

The Procurement & Finance Group (PFG) will be responsible to New South Glasgow Hospitals Executive Board.

**Role and Remit**

The following describes the group's remit in respect of a) the procurement aspects and b) financial aspects.

**a) Procurement aspects**
The PFG is accountable for the planning and delivery of all procurement measures required to deliver the identified investment and services that fall within the scope of the whole project.

The PFG will ensure the following are completed to the satisfaction of the Acute Services Review Project Board (ASRPB):-

- Procurement Plan and timetable
- Procurement Administration
- Bid evaluation process and administration
- Procurement budget control
- Issues, risks, dependency logs administration
- Change control administration

The PFG will take forward and complete all aspects of:

- Negotiating commercial issue
- Draft Contracts/Final Contracts
- Report on issues affecting affordability to the Investment Board
- Examine financing proposals and make recommendations to the ASRPB.
- Bid evaluation
- Monitor funding competition
- Develop and report Value for Money (VfM) proposals.

The PFG will be responsible for attending to all technical requirements and issues which arise during the full procurement programme and hence oversee and approve the:

- Technical Output Specs
- Bid Evaluation Process
- Test technical viability of solutions
- All planning issues
- All changes to contract/design/specification

The PFG will oversee all aspects of commissioning and agree main programme interface with equipment installations.

The PFG will have specific NHS Board delegated authority to conduct and conclude negotiations at time critical and project critical moments of the procurement process.

**b) Financial aspects**
The PFG will oversee the whole investment programme associated with the implementation of ASR and will be responsible for the planning and completion of the procurement programmes including:

- New Adult and Children's Hospital complex
- Medical and Non-Medical Equipment
- IT Equipment
- All enabling schemes
- All advisor procurements (financial, legal & technical).

It will also be responsible for ensuring that critical expenditure forecasting for the project is in line with agreed income levels supporting the roll-out of the project and this will include:

- Approval, monitoring and reporting savings plans required to fund the project
- Income forecasting
- Financial risk management assessments
- Capital cost control approval, monitoring and reporting
- Incorporation of any new service developments are matched with income sources

The PFG will advise the Acute Services Review Project Board (ASRPB) on all major financial aspects of the project ensuring that any financial concerns are raised immediately.

The PFG will consider and approve all aspects of achieving Value for Money (VfM).

The PFG will ensure all Standing Financial Instructions (SFI's) are adhered to and that all financial transactions are enacted within the appropriate financial convention of accepted practice.

The PFG will monitor financial model and affordability and examine financing proposals to advise and make recommendations to ASRPB

**5) SITE PROGRAMME CO-ORDINATING GROUP**

The role of the Site Programme Co-ordinating Group (SPCG) will be to ensure that all construction projects on the Southern General Hospital Site are planned, developed and constructed in a co-ordinated matter to ensure that all potential impacts and risks that may occur in delivering a multi construction project environment are appropriately managed. The SPCG will report to the Procurement & Finance Group.

The SPCG will ensure that:-

- There is an overall site development plan which identifies every aspect of change being planned for the Southern General Hospital Site.

- There is an agreed critical path which identifies the key actions necessary to be taken to ensure all construction takes place in accordance with the agreed programming and the appropriate level of Health & Safety, cost, time and quality are delivered at all times.

- There is a Project Steering Group managing all individual projects on the Southern General Site and an accountable officer identified to deliver the project and take account of all other projects on the site.

- Priority is given to those aspects of the site development which will provide the least overall risk (including:- Health & Safety, cost, time and service implications).

- The SPCG will sign off all planned activity to ensure the agreed critical path for site development can be met taking account of:

    - Current clinical services requirements
    - Health & Safety
    - Cost
    - Time
    - Overall programme requirement

**6) PROJECT TEAM**

The Project Team are responsible for managing the planning and delivery of all aspects of the project up to Full Business Case.

**7) NEW ADULT HOSPITAL**

**New South Glasgow and ACH Directors Group**

The Group membership will include the Acute Directors and it's key role will be to:

- Act as a focus in driving and overseeing the user input and signing off the outputs, e.g. patient models, design plans and equipment.
- Provide drive and strategic vision for the clinical redesign, co-ordinating work from different specialties.
- Act as a first stage change management control considering financial and non-financial pacts before deciding whether or not the request proceed to the NSGEB for authorisation or otherwise.
- Act as a conduit for staff groups (medical, nursing, AHP's, technical, auxillary) and keep them up to date.

**8) NEW CHILDREN'S HOSPITAL**

**Clinical Planning Group**
The New Children's Hospital Clinical Planning Group delivers a programme of work agreed and directed by the Project Team. It operates within a clear framework of delegated decision making, bringing together the strands of work being led by the Project Team and the Clinical Advisory Group.

It ensures that there is positive and consistent involvement of the public and staff. It is informed by the views of children and young people.

## Draft Membership for Governance Structure

### Acute Services Review Programme Board

**Chair : Tom Divers**

**Members:**

| | |
|---|---|
| Alan Seabourne | Project Director, New Hospitals' Project Team |
| Alastair Brown | Deputy Director of Delivery, Scottish Government Health Department |
| Alex McIntyre | Director of Facilities |
| Ally McLaws | Director of Communications |
| Brian Cowan | Medical Director |
| Calum Kerr | Scottish Ambulance Service Rep |
| Caroline Fee | JOC - Area Partnership Forum representative |
| Frances Lyall | Acute Partnership representative |
| Douglas Griffin | Director of Finance |
| Grant Archibald | Director of Emergency Care and Medical Services |
| Helen Byrne | Director of Acute Services Strategy, Implementation and Planning |
| Ian Reid | Director of HR |
| Iona Colvin | Director South West Glasgow CHCP |
| Jane Grant | Director of Surgery and Anaesthesia |
| Jim Crombie | Director of Diagnostics |
| Niall McGrogan | Head of Community Engagement and Transport |
| Peter Gallagher | Director of Finance (Acute) |
| Richard Copland | Director of Health, Information and Technology |
| Robert Calderwood | Chief Operating Officer |
| Rosslyn Crocket | Director of Women and Children's Services |
| Sharon Adamson | Head of Acute Services Planning and Redesign |
| Tony Curran | Head of Capital Planning and Procurement |
| Acute Director of Nursing | |
| *Ch(c)P Director (Clyde)* | |

**Attendees:**

| | |
|---|---|
| Anne MacPherson | Associate Director of Human Resources (Acute) |
| Heather Griffin | Project Manager, New Adult Hospital |
| Mairi Macleod | Project Manager, New Children's Hospital |
| Tony Cocozza | Head of Finance (Capital and Planning) (Acting) |
| | |
| Audit Scotland Rep | David McConnell/Jim Rundell |

Attendees will be invited to the meeting as and when required in support of the Members.

## New South Glasgow Hospitals Executive Board

| | |
|---|---|
| **Chair: Helen Byrne** | Director of Acute Services Strategy Implementation & Planning |
| Alan Seabourne | Project Director |
| Alex McIntyre | Director of Facilities |
| Brian Cowan | Medical Director |
| Douglas Griffin | Director of Finance |
| Peter Gallagher | Director of Finance - Acute Division |
| Robert Calderwood | Chief Operating Officer |
| Rosslyn Crocket | Director of Women & Children's Directorate |

Acute Director of Nursing
Technical Advisor
Legal Advisor
Financial Advisor
*Commercial Advisor*

## ASR Systems Redesign Group

| | |
|---|---|
| **Chair: Helen Byrne** | Director of Acute Services Strategy Implementation & Planning |
| **Co:Chair: Brian Cowan** | Medical Director |
| Alan Seabourne | Project Director |
| Ann Crumley | Head of Organisational Development – Acute Services |
| Anne MacPherson | Associate Director of HR |
| David Stewart | Associate Medical Director |
| Deborah den Herder | Director of Clyde Acute |
| Grant Archibald | Director of Emergency Care and Medical Services |
| Heather Griffin | Project Manager - Adult Hospital |
| Iain Wallace | Associate Medical Director |
| Ian Reid | Director of HR |
| Iona Colvin | Director South West Glasgow CHCP |
| Jane Grant | Director of Surgery & Anaesthetics |
| Jim Crombie | Director of Diagnostics |
| Karen Murray | Director East Dunbartonshire CHP |
| Mairi Macleod | Project Manager - New Children's Hospital |
| Mary Ann Kane | General Manager - Facilities |
| Morgan Jamieson | Project Medical Director, New South Glasgow Hospitals |
| Niall McGrogan | Head of Community Engagement and Transport |
| Richard Copland | Director of Health Information and Technology |
| Robert Calderwood | Chief Operating Officer |
| Robin Reid | Associate Medical Director - Diagnostics |
| Rosslyn Crocket | Director of Women & Children's Directorate |
| Sharon Adamson | Head of Acute Services Planning and Redesign |
| Tim Cooke | Associate Medical Director - Surgery & Anaesthetics |

Acute Director of Nursing
Area Partnership Forum representative
Acute Partnership representative
University representative
Communications representative

## Procurement & Finance Group

**Chair: Robert Calderwood** Chief Operating Officer

**Members:**

| | |
|---|---|
| Alan Seabourne | Project Director |
| Alec McIntyre | Director of Facilities |
| Grant Archibald | Director of Medicine |
| Helen Byrne | Director of Acute Services Strategy Implementation & Planning |
| Jane Grant | Director of Surgery |
| Mike Baxter | Scottish Government |
| Peter Gallagher | Director of Finance – Acute Division |
| Peter Moir | Head of Major Project – Capital Planning |
| Richard Copland | Director of Health Information and Technology |
| Tony Cocozza | Head of Finance (Capital Planning and Procurement) |
| Tony Curran | Head of Capital Planning |

Head of Procurement
Technical Advisor
Legal Advisor
Financial Advisor
Commercial Advisor — Independent (as per recommendation in the Gateway Review Report)

**Attendees:**

| | |
|---|---|
| Heather Griffin | Project Manager - Adult Hospital |
| Mairi Macleod | Project Manager - New Children's Hospital |
| Morgan Jamieson | New Children's Hospital - Medical Director |

Attendees will be invited to the meeting as and when required in support of the Members.

## Site Programme Co-ordinating Group

**Chair: Helen Byrne** Director of Acute Services Strategy Implementation & Planning

| | |
|---|---|
| Alan Seabourne | Project Director |
| Alex McIntyre | Director of Facilities |
| Tony Curran | Head of Capital Planning and Procurement |
| Project Leads | Lead Officers for each project |

Staff side representation
Health & Safety representation
Facilities Directorate rep
Local Communication rep

# Appendix 21
# Community Engagement

# Appendix 21 - Community Engagement

This section will detail the work undertaken under each of the key strands highlighted, how this will inform the OBC for the new hospitals and plans for further engagement.

**New South Glasgow Adult Acute Hospital**

Working in partnership with colleagues from the current Southern General Hospital an initial scoping exercise was undertaken to determine the views of patients, carers and volunteers on the physical design of the new adult hospital and inform the development of the OBC for the new adult hospital. The scoping exercise consisted of:

- 6 Focus Groups
- Questionnaire in medical and surgical wards
- Audit of complaints

In total over 242 individuals participated in the scoping exercise with approximately 60 participating in focus group discussions. These were organised around a number of specific themes. These included:

- Volunteers
- Carers
- Disabilities
- Black and Minority Ethnic Communities; and
- Patients

Questionnaires were distributed over a two-week period to Medical and Surgical wards in the Southern General Hospital. Patients were supported by ward staff to complete and return questionnaires. In total 182 completed forms were received.
Finally an audit of complaints specific to the physical environment of hospitals in South Glasgow was undertaken to identify key issues relating to the current hospital estate.

The initial scoping exercise identified a number of key themes and issues that were important in considering the future design of the new hospital. These included:

- The Hospital Environment (Internal/ External)
- Functionality
- Iconic and innovative design
- Facilities for staff, patients, carers and support groups
- Ward areas
- Accident and Emergency
- Maximising co-location of services
- Minimising travelling distances
- Accessibility
- Utilisation of green space

The findings of the scoping exercise were compiled into a detailed report (Appendix 7a). Individuals who participated in the scoping exercise met again to agree the content of the final report and discuss how the findings would be used in the future.

In addition, the Community Engagement Team has undertaken a series of presentations and inputs to local community organisations and structures to ascertain their views on the new adult hospital. These have included:

- South West Area Committee

- South Area Committee
- South East Area Committee
- Central Govan Action Plan
- Govan Community Council
- East Govan Community Council
- Greater Govan Social Inclusion Partnership
- Govan Craigton Housing Forum

This process has helped inform planning for our future engagement activities, in particular our approach to engaging around the New Hospitals Campus.

## New Children's Hospital

NHS Greater Glasgow and Clyde is committed to ensuring that families, children and young people are central to the planning for the New Children's Hospital. The first step of this commitment was to determine how children, young people and families wanted to be involved. So over a 3-month period, the Community Engagement Team conducted an extensive programme of consultation with families, support groups, charities, voluntary organisations, children and young people to determine a framework for community engagement on the buildings, services and design of the new hospital.

Over 150 groups and individuals took part in helping to shape the community engagement approach. Following this consultation an on-going community engagement structure has been agreed and implemented. This structure comprises:

A **Community Engagement Advisory Panel** with representation from clinical and nursing staff, the New Children's Hospital Project Team, Community Health & Social Care Partnerships, family support services, families and young patients. This group oversees community engagement activity in the New Children's Hospital. It ensures that the widest possible range of views are represented; that these are fed back into the planning and design processes; and that this activity is understood and supported within the existing Yorkhill hospitals.

A **Youth Panel** has been established to make sure that the issues, needs and hopes of young people are included in the design of the new hospital and a **Family Panel** provides guidance on how best to engage with families and to include their ideas in the planning and design processes.

This structure, will manage a comprehensive 5 year programme of engagement that seeks to:

- Build relationships with all interested groups
- Ensure that all aspects of engagement are conducted in an inclusive, sensitive and values-based manner
- Work with colleagues to ensure that patient and family input is central to the planning and design processes
- Develop community ownership for this significant development
- Ensure compliance with 'Fair for All' in promoting equality of participation and considering the specific impact of the development on any communities or equalities groups

The Community Engagement Manager leading on the New Children's Hospital manages these structures. In association with the Office of the Children's Commissioner for Scotland, the National Steering Group for Specialist Children's Services and the Scottish Health Council they are responsible for re-interpreting the PFPI agenda to ensure its' appropriateness for teenagers and children thus ensuring their full engagement. They are also responsible for ensuring that this process meets NHSGG&C's statutory responsibilities and PAF on Patient Focus and Public Involvement.

## Community Engagement on the Outline Business Case

NHS Greater Glasgow's Community Engagement Team and staff from the current children's hospital at Yorkhill undertook an initial scoping exercise with patients, children, young people, families and voluntary organisations who have used or have experience of the Royal Hospital for Sick Children to inform the development of the OBC around the physical design of the new hospital. The approach adopted sought to reflect Scottish Executive guidance on involving the wider public and in particular, excluded groups.

This project used a similar process to that undertaken previously for the scoping exercise for the new adult acute hospital. It used a number of qualitative and quantitative methods to engage with and gather feedback from children, young people and families. These were:

- A survey conducted in all wards and departments of Yorkhill. Community Engagement staff spent significant time in Yorkhill talking to families and patients and helping them to complete and return completed survey forms.
- Survey forms distributed to families in geographic communities outwith Glasgow that were independently completed and returned.
- 8 focus groups were held in Yorkhill and in the community with families and young people.
- A photography project by young patients recorded their views of the positive and negative features of the current buildings and physical environment
- An analysis of complaints relating to the physical environment was undertaken to identify key issues relating to the current hospital estate.

Through these methods the project met with, spoke to and heard from 320 parents/families, young people and children. These represented a wide range of groups and communities of interest. In particular it was successful in ensuring the participation of potentially excluded groups.

- 15% were aged 16 or under.
- 30% of parents had a child aged 0-5, 28% aged 6-11 and 22% aged 12-16
- 82% were white British, 7% Asian, 2% Chinese and 2% Black
- 7% of the sample was disabled, 31% were parents of a disabled child - sensory, cognitive and motor impairments were included
- 31% were or had been in-patients, 28% out patients and 31% were both in-patients and out patients. 1% of the sample was day patients

The key themes identified by this process were as follows: -

- The Hospital Environment – Fully integrated externally and internally
- Provides for staff, patients, carers and support groups
- Ward areas – Mix of single rooms and ward areas preferred
- Age appropriateness - Separate bed and play/recreation areas provided for children and teenagers
- Accommodation – Facilities for parents and families essential
- Space - Some single rooms to have sufficient space to accommodate a specialised bed, wheelchair, hoists and other equipment
- Interaction – Both communal facilities such as day or sitting rooms for families and quiet space important
- Way-finding – Co-location and compact site key
- Accessibility – Fully integrated into the design both external/internal
- Fit with wider environment and utilise green space
- Site access and car parking require to be integrated into the design

A detailed report is attached in Appendix 7a

Collectively, this process enabled a ‘snapshot’ of patient and families views to be gathered and fed into the design of the New Children’s Hospital at an early stage. The themes and issues highlighted present an initial perspective while more in-depth work, managed by the Community Engagement, Family and Youth Panels, will ensure that children, young people and families are fully engaged in the on-going project.

**Shared Themes**

In undertaking the separate processes for the adult and children’s hospitals a number of shared themes have been identified that are common to both hospitals and are important issues for service users. These include:

- Public access and car parking
- Public Transport penetration
- Way-finding and adjacencies
- Importance of outdoor space
- Importance of non-clinical space
- Accessibility

## Acknowledgements

The Community Engagement Team would like to acknowledge the children, young people and families who shared their views with us and the support of Marjorie Gillies, Siobhan Smith, Frances McGuiness, Jeanette Weir, Zarina Shaheen and all the staff who helped us find out more about children, young people and families' hopes for the New Children's Hospital.

# Key Messages

The Community Engagement Team undertook a programme of work with children, young people and families to inform the Outline Business Case for the New Children's Hospital and to contribute to its design and planning processes. The key messages were:

**Wards & In-Patient Areas**

- There should be a mix of single rooms and ward bays. Some thought that the company of other families was supportive but for others the enhanced privacy of a single room was important
- Wards should include a bed, showers, toilets and kitchen access for parents. A communal laundry area would be welcomed.
- Age appropriate areas were recommended with separate bed and play/ recreation areas provided for children and teenagers
- Age appropriate play areas were highly valued with a desire expressed for appropriately located spaces, soft play areas and access to the outside.
- Day or sitting room for families and quiet space were very important

**Outpatients & Day Patients**

- Waiting areas should have age appropriate play areas, play facilities suitable for disabled children with access to an outdoor play area desired
- Parents of children with diabetes asked for a quiet room where they could administer injections
- A quiet waiting area away from the busy activity of the waiting areas would be welcomed by some parents, particularly those with children with autistic spectrum disorders
- A quiet space for parents would also help when dealing with bad news

**Facilities**

- Car parking was the biggest single difficulty identified
- Access by public transport was also noted as a difficulty
- A Family Centre and Parent Education Centre would be highly valued
- Parents valued cafés and restaurants
- Better access to a range of shops would be welcomed
- More spacious lifts with separate lifts for transferring patients between treatment areas and wards would be very welcome
- A central reception desk located at the point of entrance would be helpful

**Space**

- The current space in wards and outpatient areas was generally felt to be adequate but enhanced space between beds would be welcomed
- The exception to this was access for wheelchair users where there was a need for greater space, particularly in wards and single rooms
- Some single rooms had to be large enough to accommodate a specialised bed and wheelchair, hoists and other equipment with enough room for disabled children and young people to transfer from bed to a wheelchair

- Toilets needed to be bigger for access for wheelchairs and buggies and a bed/ plinth and hoist for changing children and young adults
- Greater storage space in wards and single rooms would be welcomed

**Adjacencies**

- Family toilets and shower facilities should be located inside wards
- Car parking needs to be located close to the hospital to facilitate access for disabled children and those pushing buggies
- Easy access to a café/tea bar was important for all families but particularly those who were staying in the hospital
- Outpatients should be co-located with play areas and, if possible, an outdoor or soft play area
- The Family Bereavement Centre should not be located near to or on a path to the morgue or viewing facilities
- The neurological unit and neurological ward should be close together with the EEG Department in close proximity
- ITU/HDU would benefit from close proximity to a quiet room or chapel

# Introduction

Glasgow is to have a new hospital for the treatment and care of children and young people. This development, which will take place on the site of the Southern General Hospital, represents a significant element in Glasgow's ambitious plans for modernising acute services. The New Children's Hospital project will deliver a world-class facility providing local, regional and national services. In addition, the site is strategically placed to complement, and benefit from, the development of the New South Glasgow Hospital. The triple co-location of adult, maternity and children's facilities will help to ensure that mothers, babies, children and young people receive the best treatment available within modern, fit-for-purpose hospitals.

The Outline Business Case (OBC) describes the initial thinking behind the project and defines a framework for the project's future development. Therefore, it is important that the OBC for the New Children's Hospital project reflects not only NHS Greater Glasgow and Clyde's vision but also the views and aspirations of those who use it. The Minister for Health and Social Care, Mr Andy Kerr MSP and the Chairman of NHS Greater Glasgow and Clyde, Sir John Arbuthnott, have made it clear that they want to see children, young people and families involved in the design of the new hospital and in the services it will offer. This will ensure that the hospital offers not just the best clinical treatment possible but also buildings and facilities that support them through difficult times.

Therefore, NHS Greater Glasgow's Community Engagement Team and staff from the current children's hospital at Yorkhill undertook an initial scoping exercise with patients, children, young people, families and voluntary organisations who have used or have experience of the Royal Hospital for Sick Children at Yorkhill to inform the development of the OBC around the physical design of the new hospital. The approach adopted sought to reflect Scottish Executive guidance on involving the wider public and in particular, excluded groups.

''The Scottish Executive Health Department (SEHD) and NHS Scotland are committed to an inclusive process of communication, where the public have opportunities to influence decision making''

Patient Focus and Public Involvement

Similarly, the Fair for All approach requires the considerations of equality for ethnic minorities and other potentially excluded groups and whether proposed policy or service development, including service change will have specific impacts on any communities or equalities groups.

This paper provides an overview of the process involved in engaging with communities of interest around the New Children's Hospital project, summarises the key findings from the engagement activities and highlights the broad concepts and themes identified.

## Process

This project used a number of methods to engage with and gather feedback from children, young people and families. These were:

- A survey conducted in the wards and departments of Yorkhill
- Survey forms distributed to geographic communities
- Focus groups with families and young people

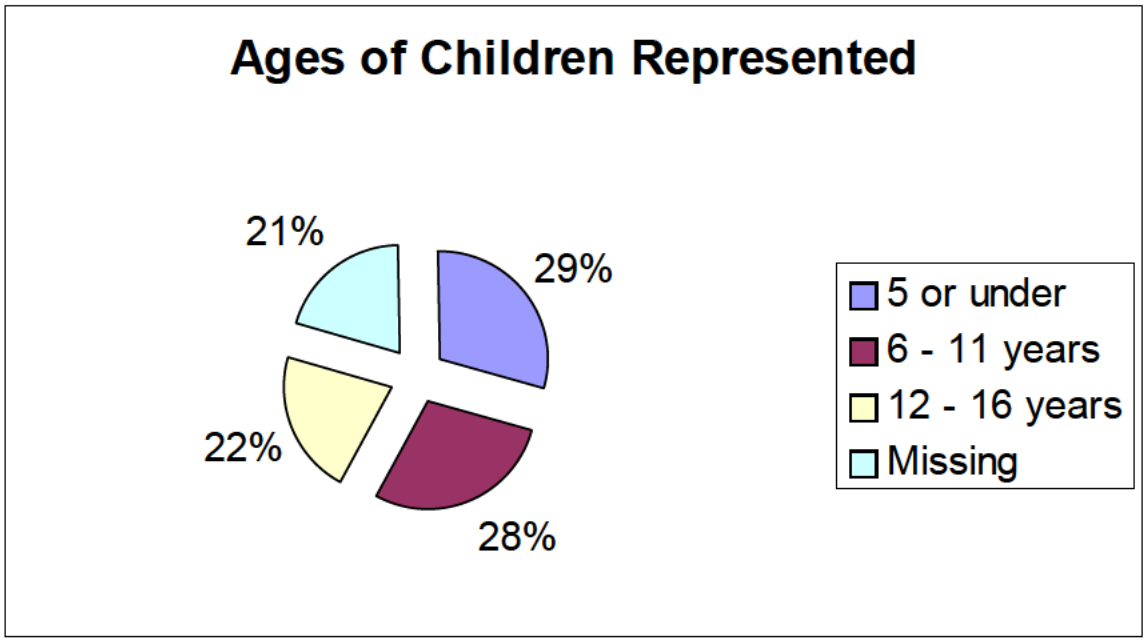
An analysis of complaints relating to the physical environment

Through these methods the project met with, spoke to and heard from 280 parents/families, nearly 30 young people and 5 younger children

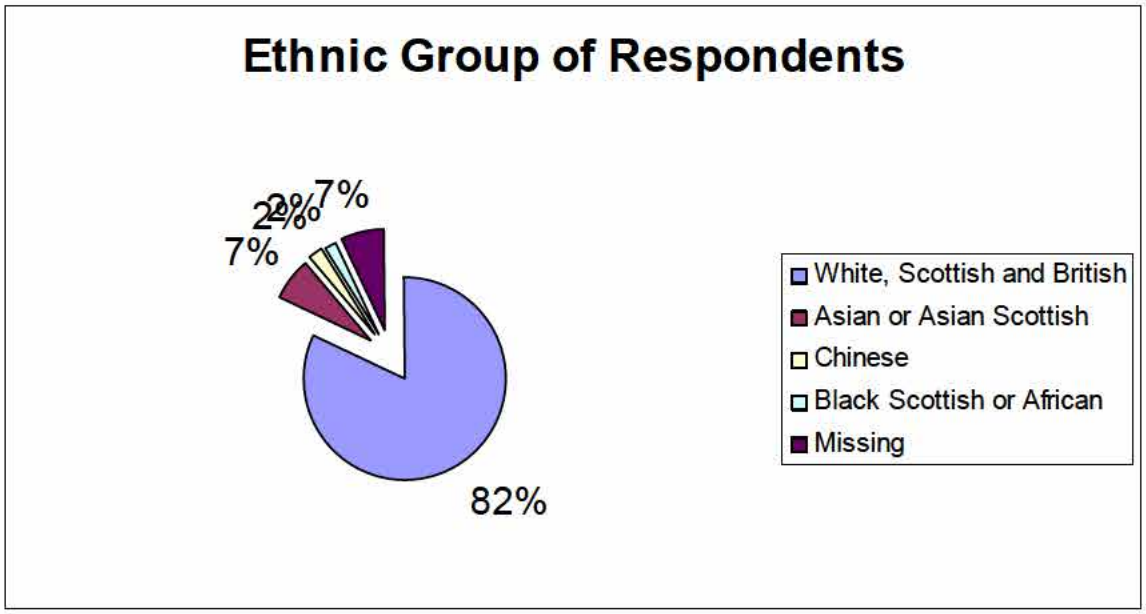
The principal method of engaging with families was a **survey** delivered by the Community Engagement Team in the wards and departments at Yorkhill. It had been hoped to provide the survey form on-line to facilitate access for geographic communities but this did not prove possible within the short time frame available. Instead, national charities and voluntary organisations supported the survey by distributing it to their membership.

In total 189 responses were gathered that allowed patients and families to comment on aspects of the existing hospital's physical design and how important they rated specific elements i.e. ward facilities. The survey respondents represented a wide range of groups and communities of interest. In particular it was successful in ensuring the participation of potentially excluded groups.

68% of the respondents were female and 25% male (7% of the data was missing). Most were aged between 25 and 40 years but, importantly, 9% were aged 16 or under. Of the parents who responded 30% had a child aged 0-5, 28% had a child aged 6-11 and 22% had a child aged 12-16 (21% missing)

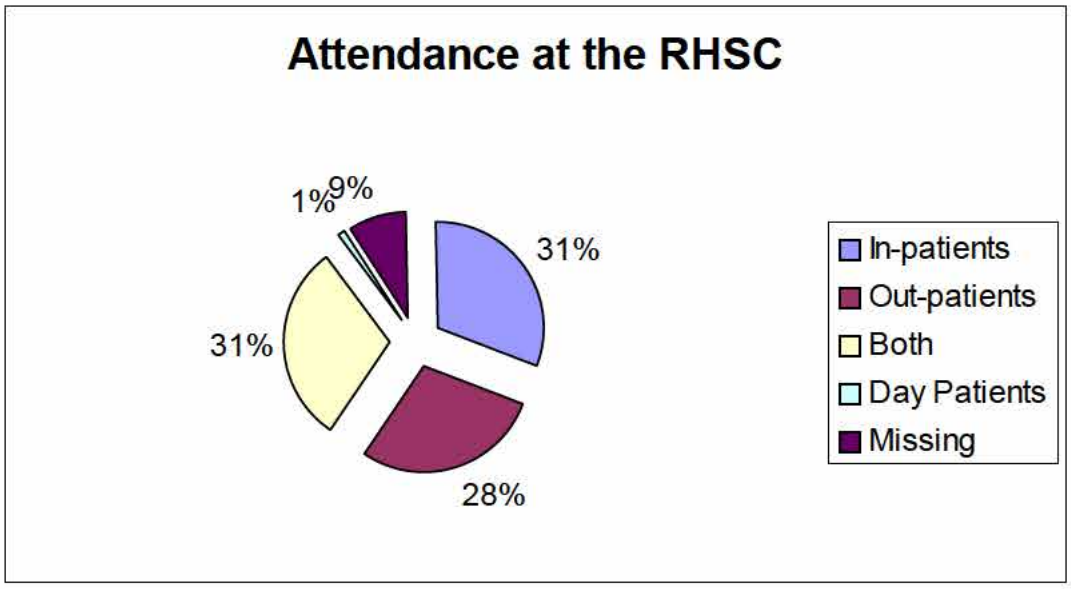


The sample respondents overwhelming described their ethnic groups as white Scottish (82%) but 7% were Asian or Asian Scottish, 2% Chinese and 2% Black Scottish or Black African (7% missing). 7% of the survey respondents were Muslim, 0.5% were Hindu and another 0.5% Sikh. These figures compare favourably with the composition of the black and ethnic minority community within the NHS Greater Glasgow and Clyde area.



The needs and perspectives of disabled people were also well represented as 7% of the sample identified themselves as disabled and 31% were parents of a disabled child. Children with sensory, cognitive and motor impairments were included.

Finally, we asked respondents to describe the nature of their use of Yorkhill. 31% were or had been in-patients, 28% attended as out patients and 31% were both in-patients and out patients. Only 1% of the sample was day patients (9% missing).



The survey was supported by a series of **focus/discussion groups**. Participants were drawn from a number of groups including patients, families and voluntary organisations that supported carers.

Although most of the focus groups were undertaken on the hospital site, there was an opportunity to run the sessions externally and this was offered in the first instance to parents of children with complex needs. These proved popular while some of the groups within Yorkhill garnered little interest and the sessions were unable to proceed. However, this exercise should be viewed as the beginning of an ongoing process and further efforts should be made in the future to engage with these groups on more substantive elements of the project to ensure the hospital is fully inclusive.

In total, 8 workshop sessions were held involving 54 participants:

| | |
|---|---|
| Young People | (11) |
| Parents of children with complex needs | (13) |
| Parents who are deaf or have deaf children | (20) |
| Parents of Teenagers | (6) |
| Volunteers/Voluntary Organisations | (4) |

Each focus group followed the same process and format and gathered participants views on:

- What was positive about existing hospital provision
- What could be done better?
- Vision for the New Children's Hospital

Young patients at Yorkhill also participated in a project to **photograph the buildings and facilities**, highlighting what they considered to be the positives and negatives of the current buildings. Some of their photographs are included in this report to illustrate the issues they raised.

Finally, the **complaints received by the Yorkhill Division specific to the hospitals physical environment were analysed**. In total, over a 3-year period 10 complaints were received specific to the hospitals physical infrastructure. These all related to the issue of car parking with 2 themes emerging from a brief analysis:

- Abuse of disabled parking spaces
- Availability of car parking in close proximity to hospital entrances

Collectively, this process has enabled a 'snapshot' of patient and families views to be gathered to feed into the design of the New Children's Hospital at an early stage. It should be stressed that the themes and issues highlighted only present initial perspectives and more in depth work is required to ensure that children, young people and families are fully engaged in the on-going project.

# The New Children's Hospital: Looking to the Future

In both the survey and focus groups participants were encouraged to draw on their experience of using our existing hospital provision. This was primarily their experience of Yorkhill but some had also attended other children's hospitals – most notably Aberdeen and some also used facilities at the Southern General, the Princess Royal Maternity Hospital, Glasgow Royal Infirmary and other adult sites. They were asked to give their view on what they thought worked well, what they liked about the existing hospital and what we could do better.

## What do we do well?

Participants were keen to stress that they were largely happy with the facilities and buildings at Yorkhill. They identified a number of features of the physical environment that they found supportive and were keen to ensure that these were not lost in the move to a new site.

### Family Accommodation

Family accommodation was highly valued with all families stressing the importance for children in having their family with them during their stay in hospital and the assistance this offered families in managing the stress of an inpatient stay. Families described how they used a number of options for accommodation including staying by their child's bedside in a fold down bed, sleeping in the ward using a recliner chair, Ronald MacDonald House and CLIC Sargent.

*"Parent and carer accommodation – I feel strongly about this because there will be lots more people like myself who will find it difficult to get back and forth to the hospital as I don't have my own transport"* Mother of 0-5 year old

A range of options was considered important as not all family's needs were served by being accommodated at their child's bedside. Where there were siblings who required accommodation or where the family was under great stress as a result of a long stay or the burden of ill health their child experienced then great importance was placed on the availability of neighbouring facilities. These allowed families to be accommodated together and also offered a small measure of relief from the ward and hospital environment.

*"Staying in is not always the best option – sometimes you need to get out"* Mother of a 2 year old in HDU

### Play Areas

Play areas were also universally acknowledged as a key aspect of the current facilities. Play areas in wards and waiting rooms were thought to greatly ease the stress of hospital attendance and the outdoor play area was valued. Play areas also played an important role in entertaining siblings during their visits to the hospital.

*"Play areas are the most important, they are so important especially when you have other children who have to come with you – they can run around and let off steam"* Mother of a teenage patient

However, there was scope for the development of play areas with a number of parents and young people identifying a lack of age-appropriate facilities, no access for disabled children to the outdoor play areas and few toys for disabled children – especially those with sensory impairments – in waiting and play areas.

*"My daughter in a wheelchair, every time we're up at Yorkhill she wants to play on the outdoor play but there's nothing for disabled children"* Mother of a 6-11 year old with complex needs

*"Should be like Brewsters with a play area indoors with a ball pool and swings and a climbing frame"* 7 year old out patient

**Cafes and Restaurants**
Cafes and restaurants featured highly in the positive feedback received from families and young people. Once again these were felt to facilitate their experience at Yorkhill providing both a neutral venue to sit with visitors, family and siblings as well as a place of respite for parents who needed both a meal and a break from the intensity of the ward environment.

*"I know it sounds daft but see at night when I was sitting downstairs with just a can of juice – its daft but I really needed that, just sitting down by myself with a can of juice"* Parent of 6 year old boy with complex needs who is a regular patient

There were, however, also suggestions for how these facilities could be improved with parents requesting that they be located closer to the wards and longer opening hours.

*"Restaurants need to be more accessible to the wards, sometimes you can only grab a few minutes and you don't ant to be away from the ward for too long"* Mother of 6-11 year old

**Youth Facilities**
The Youth Zone and Youth Booth were particularly valued by young people who welcomed the opportunity to spend time in a less clinical environment, with people their own age and in an age-appropriate setting. Parents of young people also welcomed these amenities describing how they had provided an important release for teenagers. More age-appropriate facilities and opportunities would be welcomed.

*"Better space for young people to meet. Need different stimulators compared to a toddler"* Mother of teenage out-patient

**Facilities for Family Support**
The service provided by the Family Support and Information Service was highly valued with many parents stressing the need for an on-going role for such a service. Its current location in the main reception was felt to be appropriate, facilitating access to the service. However, parents also felt that enhanced facilities would assist this service with a need for more quiet space, private interview rooms and a communal sitting room for families identified as helpful developments.

*" Quiet space - sometimes when things are not too good – peace and quiet is nice for a while - to be allowed time with your thoughts"* Mother of teenager with complex needs

Radio Lollipop, the Family Bereavement Service, the school and the chapel were also singled out as facilities that helped to create a supportive and healing environment. It was felt to be important to ensure that these facilities were transferred to the new hospital.

Parents and young people identified a need for the shops provided at Yorkhill. These were felt to be useful in providing many of the items parents needed during their stay, particularly if admission had been unexpected, and helped to pass the time during long stays. Better access to a wider range of shops would be welcomed although the cost implications of this were also raised.

*"…shops are good because you don't always plan for A&E so need toothbrush etc"* Mother of child age under 5 with complex needs

**Open Aspects**
The views and open aspects enjoyed at Yorkhill were seen as positive although the lack of outdoors space for sitting, walking or playing in the hospital grounds were a recurring theme.

## What could we do better?

As might be expected families, children and young people had a number of suggestions for how the current environment and facilities could be improved. These can be summarised under the following themes.

- Site Access
- Wards and Bedside Facilities
- Disabled Access
- External Environment
- Facilities

Each is discussed below.

**Site Access**
Car parking and vehicular access was a common concern with significant issues raised in terms of the availability of parking spaces, the distance from designated parking to hospital entrance points and the management and provision of disabled parking. There was a perception that this tended to be abused and poorly monitored. The particular issue of ease of access when pushing a pram or a wheelchair was repeatedly raised as was the need to locate disabled parking at the hospital entrance.

*"Car parking needs to be improved – horrendous"* Mother of 6-11 year old outpatient

*"…monitoring of (disabled) spaces would be useful. We currently need an extra pair of hands to pack the car, often in lower car parks – I can't push the wheel-chair up. We've adopted a drop and park system but it makes keeping appointments difficult and take two to deliver one patient"* Mother of teenager with complex needs

Overall, it was agreed that public transport provision was poor; this encompassed perceptions of bus quality and routage to access hospital sites.

*"Public transport is a nightmare if you have to get 2 buses and have other siblings with you"* Mother of teenager

Other site access issues included the distance from public transport nodes to the main site, poor signage for pedestrian or vehicular access from Argyll Street and the lack of a central reception/information desk at the point of entrance to the hospital grounds. Wayfinding and signage was a recurring theme in that there was an over reliance on standard information signs and that other options such as electronic signage, alternative formats, Braille plinths and textured walls, alternative languages etc. were not fully utilised.

*"It would be good to have texture and colour bars on the walls as it helps to steer young children"* Mother of teenage out-patient

**Wards and Bedside Facilities**

The general consensus was that the design and layout of the ward areas should focus on patient's needs. Families needs were acknowledged as secondary but, given the long periods of time spent by some families on the ward and the high levels of support they offered to the nursing staff in the care of their children there was a view that more could be done to ease their experience. Space could be better used and more done to make the patient and carer experience more comfortable. The overall ward layout was felt to be less than ideal. Limited family and carer facilities, an inappropriate mix of different age groups and poor access to bathing and toilet facilities were identified as problems.

*"You need better access to the toilets and showers, don't want to leave the ward and don't want to be away from the bed for too long"* Mother of 0-5 year old

There was no consensus on the importance of single rooms. 52% thought a single room was very important, 18% thought quite important while 5% said it was not important. Access to a single room was thought to depend on a number of factors including the level of ill health, need for isolation, need for company to aid recovery and teenagers in particular were thought to need the enhanced privacy of a single room. A number of parents and children thought that the company of other families and children was a comfort and support as they shared experiences and offered encouragement and information. This was identified as a major means of communicating information about the services and facilities available within the hospital.

*"Camaraderie between families and patients is important – can miss out if in own room"* Mother of child aged 0-5

There was a high level of support (60%) for the provision of a day room or sitting room where families in single rooms could meet together away from the clinical environment. Quiet space was also highly valued with many parents pointing to the difficulties of hearing and trying to manage bad news within a busy ward or outpatient area. 73% of the people surveyed requested more quiet space – for breaking bad news, to discuss issues away from the patient's bed or respite from the treatment areas.

*"Quiet space for patients and families, when you are feeling down or happy. Its nice to have a private place to let emotions out (good and bad) with no interruptions"* Mother of 6-11 year old patient

A particular request was made for a private interview room located near to theatre for privacy.

All parents were grateful for the provision of a bed that allowed them to stay close to their child. The provision of recliner chairs, however, was no longer felt to offer an adequate resource. Similarly, it was no longer felt appropriate to offer parents only a bed. The expectation had been raised that they would be *accommodated* within the ward and for many this meant that a range of other ward facilities was required. These included easy, safe and convenient access to showers, toilets and kitchen areas.

*"You need a shower and enough room for you to spend time yourself, also not a chair to sleep in but a bed if you no use to your child if you haven't had a good nights sleep*" Mother of 6-11 year old with complex needs

The current arrangements whereby parents needed to leave the ward to use the toilets or showers were felt to be unsafe at night and difficult in that they necessitated a lengthy break from the bedside. This was a particular issue for parents who were deaf or hard of hearing as they found the intercom system for ward access to be a significant barrier. There were repeated requests for an area where families could make and drink a cup of tea inside the ward. This, it was proposed, would make a significant difference to families' experience. Access to a communal laundry area would also be welcomed.

The space provided in current wards and single rooms was generally felt to be adequate but enhanced space between beds would be welcomed as would bigger toilets to facilitate access for wheelchairs and buggies. Parents of disabled children, however, disagreed that space was adequate and argued very strongly that greater space provision was required for disabled children and especially for disabled teenagers. This is discussed more fully below.

*"For a child like my son we need a hoist, a bed, a wheelchair so room must accommodate for these as well as a parent's bed, sink, toilet and shower and a wide doorway"* Mother of child age under 5 with complex needs

There was agreement that age appropriate areas should be recommended with separate bed and play/recreation areas provided for children and teenagers.

This was an issue of particular importance to young people who pointed to issues of privacy, company and the potential disruption to wards caused by teenagers wishing to watch videos etc after younger children were asleep.

*"Need separate space for babies and adolescents"* Father of 0-5 year old

Bedside facilities were identified as a concern with the bed spacing, environmental control, access to drinking water, lighting, noise and privacy cited. Some parents (37%) would welcome a bedside phone, fewer (33%) wanted access to a computer but those who did felt there would be significant merit in this development.

*"Access to a computer would help you manage the rest of your life"* Mother of a 4 month old in HDU

*"Children that are in for long stays need to be able to talk to friends, and friends often can't come and visit so kids need access to phones and e-mail"* Father of 6-11 year old boy with complex needs

Teenagers reported that they found bedside facilities poor suggesting greater access to computers and enhanced television access such as to freeview or Sky TV.

Storage was seen as particularly poor with the lack of lockable storage space causing concern, as did the lack of space for toys, clothes, parent's belongings etc accumulated over a lengthy stay.

*"I have noticed…a lack of shelving for long-term patients to store their DVDs, books, results of craft activities, school work etc"* Emily-Jane, age 14

*"Room size and sleep arrangement for parents is very, very important as it is ridiculous, uncomfortable and crowded in patients rooms now my 2 year old kid has been here for 10 months now and there is no room to move"* Mother of 2 year old disabled child

**Disabled Access**

Access issues were important and there was a strong consensus that Yorkhill could do more to ensure fully accessible facilities for disabled people, with more use of automatic doors, adjustable tables in play areas, video phones, accessible toilets with changing plinths and hoists all cited as examples.

*"Automatic doors – really important if you have lots of equipment – suction pack, feed pack, bog with spares, buggy!"* Parent of 6-11 year old outpatient

While most people felt that the space provided within current wards and single rooms was adequate parents of disabled children and young people strongly disagreed arguing that greater space was required. They proposed that some single rooms had to be large enough to accommodate a specialised bed and wheelchair, hoists and other equipment.

There also needed to be sufficient room for disabled children and young people to transfer from bed to a wheelchair to facilitate both their comfort and continued independence.

Washing and bathing facilities were seen as critical in that user's experience from Yorkhill suggested that the numbers and location of bathroom facilities was poorly thought out, as was the appropriateness of the facilities for disabled people. Upgraded disabled toilets with a bed/plinth and hoist for changing children and young adults were felt to be a necessity.

Play areas and equipment also needed development to be more inclusive of disabled children.

*"I think it is important all play areas and equipment should be made as accessible as possible to all children including those with physical and sensory disabilities"* Mother of teenager with complex needs

Overall, there was a strong consensus that planners had to move beyond minimum standards and aim for the highest standards using innovation and imagination to overcome challenges.

*"…need barrier free access to all areas"* Mother of disabled teenager

**External Environment**

Particularly disappointing for many was the external environment and the failure to develop and utilise green space for the enjoyment and benefits of patients and staff alike. These could provide areas for reflection and convalescence. Neurological patients, who often experienced lengthy stays in hospital, were one group that it was felt would benefit from easy access to outdoor areas while out-patient waiting areas would be significantly improved by an outdoor play area.

*"Patients are sometimes confined to their rooms for days on end so it would be good if they could see something from their windows. Sometimes patients are allowed out of their rooms although they are still attached to drips. They are therefore limited in where they can go. It would be nice if they had access to outside space, perhaps a roof garden?"* Emily Jane age 14

*"I would like to see an enclosed garden that you could take patients to sit in and patients could be involved in planting etc and wards could look onto it and have a peaceful view for patients"* Parent of 10 year old who is a regular in patient and outpatient at Yorkhill

Smoking was a real concern and the sight of smokers congregating at entrances, particularly beside the outdoor play area, gave a poor impression of the hospital. It was proposed that a shelter was needed for parents who smoke.

**Facilities**
Participants understood that planners gave most thought to the clinical configuration of the hospital site, however there was a view that more thought should be given to other areas of the patient experience and the provision of additional amenities and facilities for patient and family comfort and relaxation i.e. spiritual care, libraries, shopping, the provision of day rooms and quiet areas within wards and provision for other children. These were often seen as an after thought but families and young people felt that they required more thorough planning and consideration.

*"When your child goes to hospital you basically 'live' there at the hospital for the duration of the child's stay. It is important for the child to have an environment that is close to normal life and a comfortable, clean and caring environment. Parents need that also"* Mother of 6-11 year old boy

There were few suggestions for outpatients or day wards but one group that did identify a need for enhanced facilities were the parents of children with diabetes who requested consulting areas that ensured patient confidentiality, welfare and to create a relaxed and caring environment. In particular they proposed the provision of a family or quiet room where they could feel comfortable administering injections when attending appointments.

*"Parents sometimes need a quiet area to compose themselves – having to go to the canteen for a coffee when you are upset is horrible"* Mother of disabled teenager

The provision of quiet space was a common concern with some parents asking for somewhere quiet to gather their thoughts or deal with bad news other than sitting in the tea bar while one parent proposed that this would be beneficial for children with autistic spectrum disorders while waiting for an appointment.

*"Provision of a quiet area to allow people with autistic spectrum disorders to prepare for appointment maintaining sensory input in an acceptable way"* Mother of disabled teenager

There was some consideration of the facilities for theatres with families suggesting that theatre recovery areas should be separate from the general ward area. They also asked for a waiting area to be located next to theatre recovery and for a quiet, interview room in the vicinity where any meetings with theatre personnel could be conducted.

One facility that families proposed as requiring careful development was the Family Bereavement Centre. As with the Family Support and Information Service this was a facility that required a mixture of accommodation with quiet, private interview rooms a necessity. Most importantly it was felt that this facility should not be located near to the morgue or viewing area. It was reported that some bereaved parents found it difficult to walk past the morgue on their way to the existing service because of the association with their loss. This was closely linked to existing facilities for coping with bereavement such as relative rooms, viewing and mortuary facilities.

There was some discussion as to the appropriateness of existing provision and whether more could be done to help families manage the loss of a child.

One further facility that was identified as requiring further development was the lifts. Families proposed that consideration should be given to the provision of more lifts and in particular separate lifts for theatre access and transfer of patients between wards and departments to offer enhanced privacy.

*"When our daughter was arriving for admission seeing patients on trolleys in the lift area really upset her. Could the theatre and other lifts be separate?"*
Mother of disabled teenager

Finally, a number of comments related to the appearance of the entrance to the hospital with some feeling that this could be improved to provide a more accessible, welcoming environment. It was felt that both layout and décor could be better designed to facilitate ease of access and wayfinding around the facility.

**Adjacencies**
The following adjacencies were thought to be important: -

- Toilets and shower facilities for families should be located inside ward areas
- Car parking needs to be located close to the hospital to facilitate access for disabled children and those pushing buggies
- Easy access to a café/tea bar was important for all families but particularly those who were staying in the hospital
- Outpatients should be co-located with play areas and, if possible, an outdoor play area
- The neurological unit and neurological ward should be close together with the EEG Department in close proximity
- ITU/HDU would benefit from close proximity to a quiet room or chapel
- A waiting area should be located next to theatre recovery
- Separate theatre recovery from the general ward area

## Conclusion

The engagement work with families, children and young people proved successful in a number of regards. There was an active and enthusiastic participation from all those involved, with families, children and young people sharing positive and considered views on the physical environment of the new children's hospital. These views will now be included in the debates and discussions on the outline business case for the new hospital.

The methods adopted by this exercise offered a number of opportunities for families, children and young people to participate but there were some groups such as families for whom English is not their first language that were not so well represented. Additional efforts will be required in the future if they are to be given an equal opportunity to contribute to the design and planning processes. Further effort will also be required to develop special initiatives for children and young people to ensure their on-going and full participation.

However, as discussed earlier, this exercise should be viewed as the beginning of an ongoing process and further efforts should be made in the future to engage with these groups on more substantive elements of the project to ensure the hospital is fully inclusive.

The evidence from this project suggests that families, children and young people will prove to be a valuable partner in the planning and design of their new hospital.

Dear Kate,

I hope you remember me I am a member of the Youth Voices group and have been out for pizza with you - very enjoyable! As a patient on Schiehallion I am aware of some issues that may not be relevant for other wards, especially as I have been on the ward since January. When designing the new ward I would like the architects to take into account some of the following;

- Patients are often confined to their rooms for days on end so it would be good if they could see something from their windows. One solution would be to design the adolescent area so that the rooms all faced onto a central area; in a square. The rooms could have sliding glass doors so that even patients who were unable to leave their rooms could feel included.

- Sometimes patients are allowed out their rooms although they are still attached to drips. They are therefore limited in where they can go. It would be nice if they had access to an outside space, perhaps a roof garden?

- The room spaces themselves need some thought. I have noticed that there is nowhere for visitors to hang their coats, limited working space for the nurses and a lack of shelving for long term patients to store their DVDs, books, results of craft activities, school work etc.

- Patients presently do not have bedside lockers which is a problem as they cannot easily access their things without leaving the bed and the cupboard is often inaccessible due to the number of drip stands in the way.

- The TV/ps2 etc need to be at a height that is accessible by the patients and not so high as to cause neck strain!

- The desk should not be in a corner facing a wall; motivation for school work is low and therefore this should be a more attractive area.

- The bathroom should be closer to the patients bed as this would enable them to go to the toilet without taking their drip stands with them. They would also be more able to go unaccompanied .

- The parent bed needs to be a lot comfier, perhaps a fold down from the wall. It would also be good if there was more than one comfy chair in the room so that the patient and parent/visitor could sit at the same height and be a bit more companiable.

Yours sincerely

Emily—Jane

NHS Greater Glasgow

# Introduction

"In terms of physical design...the most important aspect is the staff as they are your first point of contact and seeing someone who puts you at ease is vital"

The redevelopment of the Southern General site represents an important phase in the modernisation of NHS Greater Glasgow's Acute Services. The New South Glasgow hospital project will deliver a world class facility providing local, regional and national services. In addition, the site is strategically placed to complement, and benefit from, unprecedented regeneration activity along the Clyde corridor and Greater Govan area.

The Outline Business Case (OBC) details initial thinking behind the project and defines a framework for the project's future development. It is important that the OBC reflects not only NHS Greater Glasgow's vision but also the views and aspirations of the wider public. NHS Greater Glasgow's Community Engagement Team and South Division undertook an initial scoping exercise with patients, carers and volunteers to inform the development of the OBC and seek views on the physical design of the new hospital. The approach adopted sought to reflect Scottish Executive guidance on involving the wider public and in particular, excluded groups.

> ''The Scottish Executive Health Department (SEHD) and NHSScotland are committed to an inclusive process of communication, where the public 'have opportunities to influence decision making'' (Patient Focus and Public Involvement). Similarly, the Fair for All approach requires the considerations of equality for ethnic minorities and other potentially excluded groups and whether proposed policy or service development, including service change will have specific impacts on any communities or equalities groups''

This report provides an overview of the process involved in engaging with communities around the new hospital project, summarises the key findings from the engagement activities and highlights the broad concepts and themes identified that will be considered in developing the project.

NHS Greater Glasgow

## Summary

"Why not have a room with booths inside were people could use mobiles"

The project engaged with 242 individuals on the ***physical*** design of the New South Glasgow Hospital.

There was a distinct pride and affection for the Southern General. The new building should reflect the Southern's role as an important part of the wider community and as an element in the regeneration of South West Glasgow.

The general consensus from participants was that functionality needs to be married with innovative design and the building should be an attractive and comfortable place to work and be cared for.

The external landscape should be viewed as an extension of the main hospital and should include a good mix of areas to enhance the experience of staff, patient's and their carers.

It was important the feeling of space at the existing Southern should be retained but travelling between different areas of the hospital campus should be kept to a minimum.

The design should maximise the opportunities for human interaction, creating a welcoming environment, putting patients and carers at ease.

Participants were keen the design should maximise the use of space to incorporate a range of additional support services, amenities and facilities.

The design should fully embrace new technologies and design techniques ensuring the care and treatment of patients is second to none.

Accident and Emergency facilities were viewed as uncomfortable, intimidating and threatening. There was a strong view that future planning needs to consider design and how to manage problem behaviour effectively.

"The place should look welcoming and homely,
relaxing with shopping - lots of people say about the shop being taken away, I certainly miss it any time I'm in"

Participants were keen to see the project as the first phase in an ongoing engagement with patients and the wider community in developing the New South Glasgow Hospital.

NHS Greater Glasgow

## Process

The project used three techniques to determine patient and carer views. These were:

- focus groups
- questionnaires: and
- audit of complaints received in South Glasgow,

The focus groups engaged participants from a number of groups including volunteers, carers and patients. In total, 6 workshop sessions were held involving 61 participants drawn from the following groups

- Volunteers
- Carers
- Disabled people
- Black and Minority Ethnic Communities
- Homelessness
- Patients (Including representation from the Spinal Injuries Unit)

"Many women of a 'certain age' really feel the heat while older patients really feel the cold"

The format for the group was piloted with staff and each focus group followed the same format:

- What was positive about existing hospital provision?
- What could be done better?
- Vision for the New South Glasgow Hospital?

The focus groups were complemented by a questionnaire circulated around Medical and Surgical wards. In total 181 responses were gathered, allowing patients to comment on specific elements i.e. Bedside facilities.

Finally, complaints received by the South Glasgow Division specific to the hospitals physical environment were collated and were summarised. In total, over a 15-month period, 31 complaints were received. The themes emerging within this brief analysis were:

- Car Parking, particularly the levels of disabled parking provision
- Toilet Facilities
- Perceived levels of cleanliness and hygiene
- Maintenance of the building fabric
- Bathing and showering facilities

Collectively, this process has enabled a 'snapshot' of patient views to be gathered and fed into the design of the new South Glasgow hospital. This report has grouped the issues raised under a number of themes and follows the structure of the workshops.

NHS Greater Glasgow

## Learning the Lessons

**What we do well**

Participants were keen that good practice form other hospitals was used. There was a strong view that there was no need to reinvent the wheel.

The Victoria Infirmary was seen as a positive example in that the building was viewed as compact.

The Southern was largely viewed as positive in terms of signage relative to other hospitals although this varied between groups.

The Spinal Injuries, Care of the Elderly and Westmarc developments at the Southern were seen as examples of good practice, however there was still room for improvement.

*"Seating throughout must be ergonomic. At outpatients clinics thought is needed to users needs eg. rheumatoid, suitable seating required and a good assortment of chairs on wards."*

Relative to other Glasgow hospitals, the Southern was seen as having good parking provision.

The open aspects enjoyed at the Southern were seen as positive although the continuing odour from the nearby sewage works was a recurring theme.

*"Lack of space around each bedside is very important, there should be more space provided"*

***What could we do better***

The design and location of existing hospitals make it difficult for public transport to deliver patients and visitors to the most appropriate point.

There were issues in terms of the management and provision of disabled parking and designated drop off-pick up points. There was a perception that these tended to be abused and poorly monitored.

Existing sites tend to consist of a large number of separate buildings with services and disciplines poorly located.

Consulting rooms are seen as poorly designed with waiting areas located to close to clinical areas.

NHS Greater Glasgow

## Learning the Lessons

Spiritual care facilities were seen as not accommodating the needs of diverse religions.

Wayfinding and signage was a recurring theme in that there was an over reliance on standard information signs.

Washing and bathing facilities were seen as important, experience from existing sites indicates that numbers and location of bathroom facilities was poorly thought out.

The quality of shopping, catering, social and recreational provision were identified as poor across almost all of NHS Greater Glasgow's sites for staff, patients, carers and relatives.

Particularly disappointing for many was the lack of attention given to the external environment and the failure to develop and use green space for the enjoyment and benefits of patients and staff alike.

There was a strongly held view across all groups that the cleanliness and maintenance of existing sites could be improved.

"Warm, light colours are important to give clean and healthy feel to the place"

The ability of existing sites to use new technology was identified as poor, restricting the provision of improved facilities for staff and patients.

Bedside facilities were identified as a concern with perceived use of mixed wards, bed spacing, environmental control, access to cold water, lighting, noise and privacy cited as poor.

Safety and security was a concern particularly in Accident and Emergency.

***Participants were then encouraged to discuss the issues identified in order to develop a vision for the New South Glasgow Hospital.***

NHS Greater Glasgow

# Realising the Vision: Wayfinding

It was important the entry point to the hospital should be a welcoming environment with a clear and visible, staffed reception area to greet patients, provide information and directions and arrange escort and guidance if appropriate.

Linked to this was the development of some form of internal transport system for people with mobility problems to help them move around the site. The idea of electric scooters similar to those used in supermarkets was suggested.

The existence of appropriate, clear and accurate signage, externally and internally, was seen as important.

The need to cater for different languages, literacy levels, and sensory impairments was seen as challenging and that innovative solutions were required such as information screens or other electronic formats. Participants from minority ethnic communities were particularly concerned about this issue.

Lifts and automatic doors could use appropriate technology such as voice information alongside more traditional Braille, symbols and raised lettering to assist users around site.

The physical design was viewed as important in assisting internal way finding by ensuring that interdependent services/ departments are co-located, reducing movement around the site.

*"There is nothing worse when entering a hospital trying to find what department or ward you are looking for if this is not properly signposted especially if you are disabled or in a wheelchair"*

*"Disability access very important, especially toilet areas, hospital signs are not very clear for directions"*

Participants were keen that the sense of space and open aspects in the existing site were retained while creating a compact and easily negotiable space. The preference would be to build upwards but not to exceed the existing site profile if possible.

The external environment should be seen as an extension of the physical building and be designed to bring people into the main entrance with reception area. This would include creating public transport hubs, disabled parking and pick up/drop of points close to main entry points.

Traffic flow and patient movement should b managed by ensuring effective co-location and linkages between services and facilities. Overall, the hospital site should be viewed as one hospital in its own right as opposed to a series of different buildings.

NHS Greater Glasgow

# Realising the Vision: Accessibility

The issue of accessibility was viewed as important by over 97% of those surveyed. The two most prominent factors were related to reaching the site i.e. transport, car parking and physical access to the building and services.

Car parking consumes considerable space and the design should look at innovative options for optimising space. Disabled car parking and emergency access should be given appropriate priority with fully monitored and policed spaces available close to the hospital main entry point (s).

Consideration should also be given to prioritising parent and child spaces. Car parking provision should be made available as appropriate for all other users with designated staff, visitor and patient areas.

However, vehicular access should not inhibit access for emergency vehicles and if possible this should be separated. Car parking was seen as important by 90% of those surveyed and reflects the broad consensus on this issue.

Public transport should be able to penetrate the site from either end but be orientated to the main access point where appropriate support can be accessed immediately i.e. reception, escort, internal transport. If public transport is to penetrate the site then there is a need for designated stops with shelters and seating with regularly updated travel information

Participants were aware that the effective management of traffic and patient/pedestrians on site presents challenges. Restricted vehicular access to the central site with an internal shuttle bus was one option discussed.

Areas that may require 24 hour access i.e. A&E, Spiritual Care Facilities should be located close together to ensure appropriate use of space, access and site security.

Consideration should not be given solely to the co-location of clinical services but broader patient, visitor and relative support.

NHS Greater Glasgow

# Realising the Vision: Environment

There was a view that the main hospital building should fit with the wider external environment and retained hospital infrastructure. Overall, the surroundings should be pleasant and attractive and give a good first impression utilising greenspace well.

The building design should aim to create a sense of space in a modern and bright environment with the imaginative use of colour and innovative décor were appropriate.

Although only 63.5% of those surveyed viewed the décor as important, the more qualitative discussions suggested that art and design should be used to enhance the building and contribute to the overall patient experience, promoting a positive, welcoming and relaxing environment. The use of colour and design should contribute to the easy navigation of the site.

The design should ensure the ease of maintenance and standards of cleanliness, separating the service components of the building from the main patient and clinical areas. This was the issue that most concerned participants.

"The initial impact upon entering the hospital is very important in that it really improves your outlook right away and helps you really recover"

"A change of environment from the usual routine is a must while in hospital for more than two days"

NHS Greater Glasgow

# Realising the Vision: Safety

A major issue from a safety perspective was the design of Accident and Emergency facilities, particularly the extent to which different patients share the same waiting area and the overall design of the waiting area.

The future hospital needs to look at the how patients who are aggressive or under the influence of drugs or alcohol can be separated from other patients who are attending, particularly families or vulnerable adults. If appropriate it was felt strongly that patients who were aggressive or cause distress to other patients should be removed to a secure area.

Bedside facilities could be more secure, including a secure locker that 87.8% of those surveyed viewed as important. CCTV could be more extensively used both internally and externally to assist in promoting a sense of security.

The design of ward areas should optimise visibility not only in terms of enhancing patient care but also to ensure a more secure environment. Equally, having a more visible staffed reception would enhance the sense of security and safety.

Safety in accessing the site was a real concern with not only on site issues but external issues such as the underpass and the industrial area to the west of the site.

NHS Greater Glasgow

# Realising the Vision: Ward Areas

For ward areas as a whole, the issues of cleanliness and hygiene were of paramount concern with the view that the building design should seek to minimise opportunities for infection. This was echoed by those surveyed with 98.9% of responses viewing the issue of hygiene and cleanliness as important.

There was a difference of opinion on a preferred ward layout. Participant's views differed between a return to the "Nightingale wards" of the past, 4–6 bed rooms or single room provision. There was universal agreement that there should be no mixed sex wards in the hospital.

Ward areas should also seek to ensure patient confidentiality and privacy is respected. The groups were keen that what ever configuration was chosen, the need for patients and nursing staff to maintain visibility was important.

"You need to control all aspects of ventilation and temperature as some illnesses depend on this'

Bedside facilities and the immediate bedside environment were viewed as important by 85.6% of those surveyed; in particular the following were highlighted:

- Temperature
- Access to cold drinking water without recourse to nursing staff
- Bedside furniture should be robust and secure
- Patients would welcome opportunity to personalise space i.e. Notice board for cards etc
- Individually controlled lighting
- Individually tailored entertainment/ communications that don't impact on other patients
- View, outlook from ward

"No large wards – the largest bay should be no more than 4 beds, preferably less"

58.6% of those surveyed stated that access to a phone at the bedside was important. Most people felt that there was a need to strike a balance between easy access and maintaining a quiet, peaceful environment for

NHS Greater Glasgow

## Realising the Vision: Ward Areas

other patients. A designated area in a ward block or floor with telephone access and/ or were mobile phones could be used was seen as achievable.

58.6% of those surveyed viewed access to a TV as important. This could be complemented by entertainment systems (i.e. game consoles for adolescents) or the Internet. Views differed on access at every bedside, ward level or other designated areas. Participants also felt that the design needed to incorporate a range of different areas

"A place to relax for patients and talk in private or watch TV, strict rules about eating and drinking and definitely no smoking"

linked to wards for the benefit of staff, patients, visitors and carers. For example, TV room, day room, quiet room, Internet access. This was echoed by those who responded to the questionnaire with 77.3% identifying dayroom provision as important while the concept of a discharge lounge was only seen a important by 45.3% of respondents.

"The area you are staying in is most important and needs to be homely and welcoming. If there are windows it would certainly be nicer to look at some greenery"

Almost universally, bathing and toilet facilities at ward level were viewed as inadequate. This was echoed by those surveyed with 97.8% viewing this aspect important.

A view from the bedside was only considered important by 39.8% of respondents while 80.6% felt that space for appropriate seating was important.

The most significant factor for respondents was the issue of environmental control with 98.3% of those questioned viewing the ability to control the immediate environment around the bedside as important.

NHS Greater Glasgow

# Realising the Vision: Shopping

The need for a range of shopping facilities was identified, this included a number of fixed and mobile retail units, and a good coverage of vending machines in public spaces.

In addition, most people felt that that there should be a variety/ mix of communal space spread throughout the hospital environment to enable patients/ visitors/ staff to socialize and meet, these should include designated café areas.

In terms of fixed shopping units, the types of facilities envisaged included:

- Café/ Coffee shop
- Small general store/ supermarket/ cards/newspapers
- Florist
- Hairdresser
- Fruit stall
- Social area for patients/ staff

This was echoed by those who responded to the survey with 50.8% identifying a hairdresser as an important contribution, with shops in general viewed as important by 63.5% and a café area seen as important by 80.7%. There should be some element of 24 hour provision, including A&E, in a vending machine format or alternative.

In addition, there was identified an opportunity for some form of library with internet access accessible to staff, visitors and patients to utilise, potentially in partnership with Glasgow City Council. Crèche and play facilities were a recurring theme for patients/ carers/ relatives and staff.

# Realising the Vision: A&E

"Wheelchair access is still difficult – opening an internal door in corridors; disabled spaces all used not by badge users – and no space to get wheelchair out."

In terms of emergency care, the overriding priorities were safety and waiting facilities, which were viewed as inter-related.

The first issue was actually arriving at A&E where there was a feeling that there should be some form of emergency parking provision available on a short stay basis.

It was felt important that there was a highly visible security presence on site to discourage aggressive or intimidating behaviour, the design of the A&E should attempt to minimise potential for patients and their carers to feel ill at ease or intimidated.

In extreme cases the A&E should have facilities to remove rowdy, drunk or aggressive attendees from the main waiting areas into a more secure manageable environment (separate from other patients) with security personnel in attendance.

The treatment/ consulting areas have the perception of being poorly soundproofed and not conducive to retaining patient dignity or privacy, often when they are at their most vulnerable.

People were keen that the overall environment is welcoming and puts people at ease in what are potentially difficult and trying circumstances.

NHS Greater Glasgow

# Realising the Vision: General

Participants felt that consulting rooms should be large enough to accommodate a wheelchair user or allow the option of a carer or relative sitting in as a support.

72% of those surveyed felt some form of relatives' room would be important while 67% felt that some form of overnight carer accommodation would be an important addition. Overall, there was a view that more consideration needs to be given to facilities for relatives and carers.

"Pleasant surroundings relax people...what about a council library on the grounds of the hospital site

Although only 50% of those surveyed felt that spiritual care facilities were important, there was a consensus in the focus group discussions that this facility was necessary.

They should be accessible 24 hours, seven days a week and be able to cater for congregational type activities but also for individual contemplation and reflection.

There was some support to look at the potential for individual quiet rooms/prayer rooms at individual ward level/dispersed throughout the hospital.

Morgue facilities and how corpses were viewed were also seen as important issues for consideration, particularly amongst minority ethnic communities.

There was a consensus that the range of organisations and volunteers who work with the hospital need to be catered for, including office, training accommodation and modern facilities for initiatives like hospital radio.

"WHILST THE DÉCOR SHOULD BE PLEASANT AND CLUTTER FREE, IT SHOULD NOT BE EXTRAVAGANT, CAFÉ AND SHOPPING FACILITIES ARE NECESSARY FOR STAFF, PATIENTS AND VISITORS"

***Adult and Paediatric Patient Activity***

The breakdown of both adult and paediatric patient activity seen within Glasgow Acute Hospitals by Health Board of patient residence in 2009/10 along with trends over the last 6 years is shown below.

**Table 1**
**2009/10 - Patient Activity seen within Greater Glasgow & Clyde Acute Hospitals (by Health Board)**

| Health Board | Inpatient Episodes | | Day Case Episodes | | New Outpatient Attendances | |
|---|---|---|---|---|---|---|
| Greater Glasgow & Clyde | Actual 228,862 | % 84.8% | Actual 120,703 | % 82.1% | Actual 366,612 | % 86.8% |
| Lanarkshire | 12,694 | 4.7% | 10,486 | 7.1% | 21,092 | 5.0% |
| Highland | 11,959 | 4.4% | 6,981 | 4.7% | 16,693 | 4.0% |
| Ayrshire & Arran | 7,276 | 2.7% | 5,084 | 3.5% | 10,413 | 2.5% |
| Forth Valley | 3,677 | 1.4% | 2,463 | 1.7% | 4,215 | 1.0% |
| Dumfries & Galloway | 1,043 | 0.4% | 297 | 0.2% | 1,049 | 0.2% |
| Others remaining Scottish | 3,333 | 1.2% | 893 | 0.6% | 2,183 | 0.5% |
| Others | 1,143 | 0.4% | 65 | 0.0% | 295 | 0.1% |
| Total | 269,987 | 100.0% | 146,972 | 100.0% | 422,552 | 100.0% |

It can be seen that over 80% of the workload is attributable to NHS Greater Glasgow & Clyde residents.

Patients from Lanarkshire and Highland account for approximately 5% and 4% of inpatient activity respectively.

**Table 2**
**2009/10 Age 0-15 Patient Activity seen within Greater Glasgow & Clyde Hospitals (by Health Board)**

| Health Board | Activity Inpatient | Episodes | Day Case Episodes | | New Outpatient Episodes | |
|---|---|---|---|---|---|---|
| Greater Glasgow & Clyde | **Actual** 12604 | **%** 64 | **Actual** 7105 | **%** 69 | **Actual** 26926 | **%** 83 |
| Lanarkshire | 2817 | 14 | 1781 | 17.5 | 3272 | 10 |
| Highland | 689 | 4 | 338 | 3 | 680 | 2 |
| Ayrshire & Arran | 933 | 5 | 452 | 4.5 | 684 | 2 |
| Forth Valley | 934 | 5 | 405 | 4 | 543 | 2 |
| Dumfries & Galloway | 269 | 1 | 34 | 0 | 176 | 0 |
| Others remaining Scottish | 1114 | 6 | 248 | 2 | 313 | 1 |
| Others | 186 | 1 | 4 | 0 | 33 | 0 |
| Total | 19546 | 100 | 10367 | 100 | 32627 | 100 |

It can be seen that between 64% of the inpatient activity is attributable to Greater Glasgow and Clyde residents.

Patients from Lanarkshire account for 14% of the inpatient activity.

**Activity Trends**
Table 3 below, details the overall activity trends for adult activity over the last 6 years from 2004/05 to 2009/10.

**Table 3**
**Activity Trends within Glasgow Adult Acute Hospitals over the last six years for in-patient episodes, day cases and new out-patient attendances**

| | 2004/05 | 2005/06 | 2006/07 | 2007/08 | 2008/09 | 2009/10 | Percentage increase in activity between 2004/05 and 2009/10 |
|---|---|---|---|---|---|---|---|
| In-Patient Activity | 253,778 | 254,324 | 262,487 | 274,185 | 278,409 | 269,987 | +6.4% |
| Day Cases Activity | 124,242 | 129,703 | 133,949 | 133,654 | 138,147 | 146,972 | +18.3% |
| New Out-Patient Activity | 381,285 | 401,667 | 389,523 | 390,987 | 420,163 | 422,522 | +10.8% |

From the table it can be seen that overall adult in-patient activity has increased by 6.4%, day cases by 18.3% and out-patients 10.8%.

It should be noted that New South Glasgow Hospital will not undertake surgical day case activity and will provide a local out-patient service for the South West Glasgow patients only.

Table 4 below details paediatric activity trends over the last 6 years. It shows that from 2004/05 to 2009/10 inpatient activity has risen by 4%, day cases by 13%, and outpatients by 10 % .

The current RHSC treats children from Greater Glasgow and Clyde up to their 13th birthday the new children's hospital will take 13 and 15 year olds and this activity is included in this table.

**Table 4**
**Activity Trends Age 0-15 in Greater Glasgow & Clyde Hospitals over the last five years for in-patient episodes, day cases and new out-patient attendances**

| | 2005/06 | 2006/07 | 2007/08 | 2008/09 | 2009/10 | PERCENTAGE INCREASE IN ACTIVITY BETWEEN 2005/06 AND 2009/10 |
|---|---|---|---|---|---|---|
| In-Patient Activity | 18795 | 18330 | 18711 | 19459 | 19546 | +4% |
| Day Cases Activity | 9056 | 9066 | 10013 | 9655 | 10367 | +13% |
| New Out-Patient Activity | 29391 | 31472 | 32460 | 32644 | 32627 | +10% |

# *APPENDIX B*

# *DEMOGRAPHY AND HEALTH STATUS*

## *Appendix B*

## *Demography & Health Status*

*Life expectancy*

Although life expectancy is modestly lower for both GG&C males and females compared to their other Scottish counterparts, it is improving for both genders at a similar percentage rate (Table 1). This reflects the fact that age specific mortality rates for both genders and most age groups in GG&C continue to decline in response to concerted efforts to provide a comprehensive range of modern health services and improve housing conditions, environmental and occupational settings, and lifestyle via health improvement initiatives. Life expectancy is also rising for the socially deprived sub-groups in GG&C, although not as quickly as for those in the most privileged neighbourhoods.

**Table1: Life expectancy at birth in Scotland 2006-2008 for GG&C and for Scotland, by gender, and comparisons with 1996-1998**

| | 2006-08 | 1996-98 | Difference | % |
|---|---|---|---|---|
| | Years | Years | in years | change |
| Scotland Males | 75.0 | 72.4 | 2.6 | 3.6 |
| Greater Glasgow & Clyde males | 72.7 | 70.2 | 2.5 | 3.6 |
| | | | | |
| Scotland Females | 79.9 | 78.1 | 1.9 | 2.4 |
| Greater Glasgow & Clyde females | 78.6 | 76.7 | 1.9 | 2.5 |

*Social Deprivation*

The size and complexity of GG&C is further complicated by the existence of large and concentrated areas of social deprivation which sit alongside some of the most privileged parts of Europe. Standardised mortality ratios (all cause) 0-64 years and 0-74 years, which reflect *relative mortality*, will therefore remain high in GG&C, and will remain the highest in Scotland, because they reflect the fact that most of the social deprivation in Scotland is concentrated in the GG&C area. Relative to the declining mortality rates in the rest of Scotland, the declining mortality rates in GG&C remain higher and will continue to do so for the foreseeable future.

The Scottish Index for Multiple Deprivation was calculated at datazone level across Scotland in 2004, 2006 and 2009. The Health Boards with the largest proportion of their datazones in the 15% most deprived are Greater Glasgow & Clyde (30.4%), Ayrshire & Arran (18.3%), Lanarkshire (17.4%), Tayside (13.3%) and Fife (11.3%). The Health Boards with the largest proportions of the 15% most deprived datazones in Scotland are Greater Glasgow & Clyde (45.9%), Lanarkshire (12.9%), Ayrshire & Arran (9.0%), Lothian (8.8%) and Tayside (6.8%). Between them these 5 Health Boards with the largest proportions of the most deprived datazones nationally contain 83% of the 15% most deprived datazones in Scotland, with two thirds contained in the first three.

*Morbidity*

There are multiple sources of data on morbidity experienced by residents of GG&C, all of which have strengths and weaknesses. The QOF prevalence dataset demonstrates that for some, but not all, conditions measured by the national framework in 2008/9, the prevalence in GG&C was higher

than for Scotland (Table 4). These include chronic obstructive pulmonary disease, congestive heart failure, new cases of depression, epilepsy and mental health problems.

*Admission rates (based on episodes of discharge from day case or inpatient care)*

National SMR1 datasets demonstrate that age specific admission rates are considerably higher in GG&C than in Scotland as a whole for most age groups. GG&C age-specific admission rates are usually the highest of all the health board rates. In 2008/9, the most recent year for which there is routinely published admission data, the admission rate (all specialities and all ages) was 14% higher in GG&C than for Scottish residents as a whole (Table 2). Social deprivation as a cause of increased morbidity is probably the main factor directly causing high admission rates but social factors play an indirect role in contributing to avoidable admission, as does proximity to secondary and tertiary hospital services. It is worth noting that admission rates for children aged 0-14 years are lower in GG&C than for Scottish children as a whole.

**Table 2: Age-specific rates of hospital discharge (episodes) and Crude rate (all ages) per 100,000 during 2008/9 for GG&C and Scotland.**

| | Rates | |
|---|---|---|
| Age group | GG&C | Scotland |
| 0-14 | 11,468 | **12,414** |
| 15-24 | 12,124 | **11,445** |
| 25-34 | 14,732 | **13,707** |
| 35-44 | 21,378 | **17,600** |
| 45-54 | 29,010 | **23,460** |
| 55-64 | 42,435 | **34,315** |
| 65-74 | 68,891 | **55,067** |
| 75-84 | 95,469 | **80,525** |
| 85+ | 124,198 | **102,539** |
| All ages | 30,756 | **26,936** |

# *APPENDIX C*

# *BED COMPLIMENT FOR THE NEW CHILDREN'S HOSPITAL*

***Appendix C***

**Bed Complement for the New Children's Hospital**
**Review of Planning Assumptions**

Current planning for the New Children's Hospital (NCH), as reflected in the Outline Business Case, is based on a total bed complement of 240 beds (appendix A). This overall bed model includes inpatient capacity (including 12 beds provided within the NICU), day case, short stay and inpatient child psychiatry beds.

This bed model was agreed by NHS GGC on the basis of a review undertaken by CHKS during mid-2006. The CHKS report was informed by a number of key assumptions

1. Improved performance (as measured by average length of stay and day case rates) based on a benchmarking exercise utilising a peer group of 6 specialist children's hospitals and 5 major teaching hospitals with significant paediatric activity (all in England)
2. Improved efficiency in bed utilisation equating to average occupancy rates of 85% and 65% in elective and emergency areas respectively
3. An overall 11% reduction in acute hospital activity due to a projected 12.5% decline in the under 16 population by 2015
4. The transfer into the NCH of paediatric neurosurgical activity from the INS and all patients aged up to 16 currently cared for in other Greater Glasgow Hospitals. (Note: paediatric services currently provided in Clyde were not included in any of the planning assumptions)

Based on these assumptions the initial bed complement agreed in discussion with CHKS was 245. This was subsequently reduced to 240 following internal discussions with the Women's and Children's Directorate Management Team and NHS GGC. This additional reduction of five beds was based on

a. An agreement that the complement of inpatient psychiatry beds (not considered in the CHKS report) could be reduced from nine to six
b. The calculation that a reconfigured hospital incorporating, in particular, the co-location of Cardiology and Critical Care, could increase efficient bed utilisation by a further two beds (Note: this co-location was not achieved in the development of the Public Sector Comparator for the OBC but is being actively revisited at present and appears achievable)

The CHKS recommendation was shaped around an overall reduction of inpatient beds by 72 this figure was based on

34 beds arising from improved performance
15 beds arising from improved utilisation
23 beds arising from reduced demand due to demographic change

This reduction was partially offset by an increase in short stay and day case beds to facilitate improved performance such that the overall proposed reduction equated to approximately 50 beds based on an existing complement of 271 beds at RHSC and a "virtual" pool of approximately 18 – 20 beds currently accommodating the non-RHSC paediatric activity in other Glasgow hospitals (including the INS).

**Current Situation**

Population Projections

The CHKS report was based on the General Register Office 2004 population projections by Health Board area and age group (the most up-to-date available at that time) and used the projection for the 0-15 population in Greater Glasgow as a proxy for overall demographic change in respect of the RHSC catchment area.
The intervening years have seen an upward shift in the birth rate in Scotland (there has been a 13% increase in the births per annum in the 5 years to 2007[1]) which has now been reflected in significantly revised population projections. It is also noteworthy that in basing their calculation on the under 16 Greater Glasgow population as a whole the CHKS report did not accurately reflect the geographic referral base for RHSC (around 50% of RHSC admissions are from outwith the Greater Glasgow area) or the normal age profile (over 50% of inpatients are under 5 years).

Based on the most recent GRO population projections by Health Board and age range (2006-based; issued January 2008[2]) staff at the General Registrar Office have reviewed the inpatient activity (2006-2007 figures) at RHSC based on bed days broken down by age band and Health Board of origin and provided revised projections for future demand up to 2016 – 2017. These projections suggest that demographic change within the current RHSC referral base will result in a minimal reduction in activity (200 bed days; 0.4%) by 2013-2014 albeit with a shift towards an increased proportion of patients under 5 years (54% rising to 57%).

It is pertinent to note that these calculations are based on 2006 projections. Formal population projections, including those broken down by Health Board and age, are issued biennially and will not therefore be available for a further year. Interim data from the GRO does however emphasise the continuing upward trend in birth rate[3]. The first half of 2008 saw 1500 more births than the corresponding period of 2007 and the second quarter births in 2008 were the highest recorded for 11 years.

Activity

Although there is some year on year fluctuation, activity patterns at RHSC have remained fairly constant over the past 3 years. During the same timeframe overall average length of stay has reduced by 8.5%.

1. Scotland's Population 2007, The Register General's Annual Review of Demographic Trends, General Register Office, August 2008
2. Population Projection Scotland (2006 – based), General Register Office , January 2008
3. Births, Marriage and Deaths, Quarterly Figures, General Registrars Office, September 2008

| | **2004-2005** | **2007-2008** |
|---|---|---|
| Day Case | 6753 | 10033* |
| Inpatients (EL) | 6531 | 7996 |
| Inpatients (EM) | 8830 | 8400 |
| Inpatients (Total) | 15361 | 16396 |
| Bed Days (EL) | 27678 | 31105 |
| Bed Days (EM) | 30087 | 25320 |
| Bed Days (Total) | 57765 | 56425 |
| ALOS (EL) | 4.2 | 3.9 |
| ALOS (EM) | 3.4 | 3.0 |
| ALOS (Total) | 3.76 | 3.42 |

*a significant element of the rise in day cases has been due to the transfer of GG dental activity from the Dental Hospital to RHSC in 2007. Non GG day case activity has changed from 3117 per annum to 4299 per annum in same timeframe

Performance

Given the methodology and data base used for the CHKS report it is not possible to replicate that analysis in order to test performance assumptions against more recent data comparing RHSC with peer group hospitals. RHSC does however currently participate in a peer group programme led by Civil Eyes Research which also includes 13 other children's hospitals, or major teaching hospitals with paediatric units, across the UK including all the specialist children's hospitals utilised by CHKS. The CER analysis has focused on the 60 most common HRGs and has compared performance in terms of ALOS and day case rates. Analysis of the data suggests not insignificant inter-hospital differences in the approach to, and depth and accuracy of, the coding which underpins the allocation to HRGs and this requires to be taken into consideration in any interpretation of the data. This work does however offer the only currently available mechanism which allows some up-to-date peer group comparisons.

In regard to bed days the CER approach analyses the number of potential bed days which could be saved per HRG at each hospital were performance to match the 25$^{th}$ centile length of stay of the entire group for that HRG.

Inevitably the CER analysis reveals differences between hospitals both in terms of their overall capacity to reduce bed days and their performance in respect of individual HRGs. Across the full range of HRGs and all 14 hospitals the improvement that could be achieved by each unit consistently matching "best performance" was 0.54 bed days per spell* (Birmingham 1.13 bed days per spell; Liverpool 0.58 bed days per spell; Manchester 0.50 bed days per spell; RHSCG 0.84 bed days per spell)

Using this analysis, were RHSC to match *existing* average performance across the 14 hospitals (ie a saving of 0.3 bed days per spell – from 0.84 to 0.54) this would equate to a saving of 2500 bed days or equivalent of 7 beds.

**Note: CER analysis uses "spells" as opposed to FCEs*
Matching "best performance" for each individual HRG (ie saving 0.84 bed days per spell) would equate to a saving of 6800 bed days or 18-19 beds.

These potential savings relate to the top 60 HRGs. Applying this analysis, which is already subject to significant caveats, to the total activity of RHSC (or indeed any of the other hospitals) would involve significant additional assumptions that would, in turn, preclude drawing reliable conclusions. For illustration purposes however applying an improvement to match average performance (ie an improvement of 0.3 bed days per spell) to the overall activity of RHSC would equate to a reduction of 4900 bed days (13-14 beds) and applying a reduction of 0.84 bed days per spell to overall activity would equate with approximately 37 beds.

As already identified there are substantial differences in the CER approach to that used by CHKS which precludes reliable cross-referencing. The two reports have been considered in the context of the work undertaken by ISD (see below) and it has been recognised that it is not possible to make meaningful direct comparisons. The CER data is not however thought to have identified any obvious or significant shift in the bed modelling implications of RHSC matching a "virtual" best performance children's hospital that would suggest that the reduction of 34 inpatient beds used by CHKS does not remain essentially valid.

Information Services Division

Given the recognised change in the demographic projections published by GRO in early 2008, ISD were invited to review the CHKS report and its assumptions in the light of the changed projections and more updated activity levels.

Opportunity was also taken to invite ISD to consider the CER benchmarking approach and the feasibility of cross-referencing to the CHKS performance analysis albeit, as already identified, it was concluded that accurate cross-referencing was not possible and that no conclusion could be drawn other than the absence of any evidence of a significant shift in relative performance between RHSC and virtual “best practice”.

The report provided by ISD applied the efficiency benchmarks utilised by CHKS and the same assumptions regarding occupancy levels. The report also confirms that ISD found the impact of altered demographic projections to be essentially the same as GRO. Although there is some year on year variation due to fluctuations on activity levels the ISD calculations would suggest the need for a bed complement (excluding 6 child psychiatry beds) of between 246 – 256 beds (inpatient and ambulatory care). The report also recognised that at this level of inpatient bed provision, and with current activity patterns and performance, daily variation in admission rates means the hospital would be unable to accommodate demand (even at 100% occupancy) on “numerous days”.

Conclusion

The existing NCH bed complement of 240 beds has been based primarily on work undertaken by CHKS in 2006 which was, in turn, predicated on a number of key assumptions regarding improved performance, improved bed utilisation, a falling child population and specific agreed patient transfers (neurosurgery and GG adolescent patients).

Recent review of these assumptions demonstrates that one parameter (demographic change) has significantly altered in the interim. This element contributed 32% of the overall planned reduction in bed numbers (23 of 72 inpatient beds: allowing for the enhancement of day and short stay beds to enable improved performance, 32% of the overall final bed reduction of 50 beds would equate with around 16 beds).

The work undertaken with GRO and ISD has confirmed the impact of the identified changes in the population projections. Taken in conjunction with consistent activity patterns and the absence of evidence to alter the performance improvement assumptions applied in the CHKS report, consideration requires to be given to the implications of the revised population projections for the bed complement of the NCH.

In that regard it is pertinent to note there are a number of uncertain variables in respect of future activity patterns of RHSC particularly in regard to

- the future pattern/sustainability of DGH services (or elements thereof) across the West of Scotland
- the full impact of changes in the age limits for children’s services both in respect of DGHs and in regard to any application, within GG, of the original Kerr recommendation that patients aged 16-18 years should have the option of opting for care in a children’s unit

These issues do not lend themselves to accurate analysis or prediction at the present time but would, if anything, be likely to increase rather than decrease RHSC activities. Inevitably all of these matters need to be considered in the light of RHSC’s role as a sole provider of local services, many regional services and a number of Scotland-wide services.

# *APPENDIX D*

# *BENEFITS EXPECTED FROM THE PROJECT*

***Appendix D***

***Benefits Expected from the Project***

## 1. BENEFITS EXPECTED FROM THE PROJECT

The following details the benefits which the investment in the New South Glasgow Hospitals will bring. The benefits fall under the following categories:

1.1 Clinical Quality
- 1.1.1 Establishment of Critical Co-Locations
- 1.1.2 Enhanced Patient Services
- 1.1.3 Reduction in Hospital Acquired Infection (HAI)

1.2 Sustainability of Services – (consolidation of services)
- 1.2.1 Ensuring continuing sustainability of clinical services
- 1.2.2 Optimal use of resources
- 1.2.3 Clinical Governance/Standardisation

1.3 Performance Improvement
- 1.3.1 General Issues
- 1.3.2 Performance Improvement – Emergency Activity
- 1.3.3 Performance Improvement – Elective Activity
- 1.3.4 Performance Improvement – Facilities Management (FM)
- 1.3.5 Performance Improvement – Information Technology (IT)

1.4 Physical Environment
- 1.4.1 Physical Environment – General Issues
- 1.4.2 A Healing Environment

1.5 Human Resources (Staffing and Workforce)
1.6 Environment Considerations
1.7 Enhanced links with the University
1.8 IT
1.9 Accessibility to Hospital
1.10 Economic and community benefits

The following section describes these benefits in more detail.

## 1.1 CLINICAL QUALITY

The design and build quality of the new South Glasgow hospitals will offer a world class environment for clinical care supporting significant improvements in the quality of clinical services and a reduction in hospital acquired infection. The following explains this in more detail.

### 1.1.1 Establishment of Critical Clinical Co-Locations

A major strength of Yorkhill Hospital had been its physical co-location with the Queen Mother's Maternity Hospital. Links however with adult clinical services were less good requiring staff to move between adult and children/maternity sites and on occasion the physical transfer of adult women across Glasgow to adult hospital facilities. The building of the new South Glasgow Hospitals allows "triple location" of adult, children's and maternity services onto one site. This "triple location" will mean appropriate staff will be available for the majority of clinical situations affecting all patient groups. This will eliminate the need for transfer of babies or women across the city to other sites and result in less distress for relatives, less staff movement and more efficient working practices.

The design of the new hospitals allows for a physical link between neurology and neurosurgical services and new adult and children's services. At present paediatric neurosurgical services are fragmented. A number of "work-arounds" have been developed to support this service however this present model of care is associated with inefficiencies and is not fit for purpose for modern medical practice. The co-location and physical linkage between the Institute for Neurological Sciences and the New South Hospitals allows the present model to be developed allowing easy access for patients to the optimal clinical environment and to appropriate specialist staff

Many of the buildings from which clinical services are currently provided date from the Victorian/Edwardian eras and have evolved piecemeal over the last 100 years with restricted opportunities available to achieve desirable clinical co-locations. Whilst these buildings have been adapted over the years as far as possible; these facilities do not lend themselves to the 21st century practice of medicine. The buildings and their associated clinical departments are often geographically remote from one another resulting in a large volume of staff and patient movement. As a result of these constraints the redesign of clinical services to date has been limited. The new South Glasgow hospitals development supports interdependent services to be optimally co-located resulting in an overall more efficient service.

### 1.1.2 Enhanced Patient Services

Consolidation on the Southern General site will achieve triple location of adult, maternity and children's services. The benefits this will deliver are detailed in section 1.1.1.

Bringing three adult hospitals onto one site has clear benefits around being able to build multidisciplinary specialist teams with 24/7 specialist availability. Having larger clinical teams means that, in general, higher cost treatments/interventions can be more efficiently deployed. Furthermore clinicians are better able to acquire and maintain required specialist skills. Duplication of resources on multiple sites is avoided.

The separation of elective and emergency work streams allows for high quality streamlined emergency care which at the same time avoids elective services being interrupted by emergency work and bottlenecks forming. In more detail, existing hospitals experience considerable cross over between emergency and elective work. While attempts have been, and continue to be, made to re-configure services to separate these flows; the success of this re-configuration is hampered by the design of existing buildings. The result of this cross over in flows is that pressure on one tends to lead to problems with the other. The design of the new South Glasgow hospitals has focussed on keeping emergency and elective work

separate. Effectively this will mean a better quality of care in that potential for bottle necks will be reduced and it will be easier, for example, to maintain the 4 hour wait Emergency Department standard at times of increased emergency activity without this coming at the expense of elective waiting times' guarantees

Combining clinical services from multiple sites affords the opportunity to realign beds across clinical specialties. This will improve occupancy rates and reduce the clinical risks and delays in patient care which occur due to "boarding" patients outwith the appropriate specialty.

The triple co-location of adult and children's will improve the quality of care of patients as they move from childhood to adulthood. Adolescence is recognised as a time of major physical and emotional change and stress. Many patients who suffer from chronic conditions (such as diabetes) experience increasing problems through their adolescent years. These difficulties are compounded where transition care arrangements are sub-optimal. Transitional services (where they exist) are currently fragmented. This is due to a combination of the lack of physical co-location of hospital sites and the need for Yorkhill to link to 5 adult hospital sites in Glasgow. The new South Hospitals build affords a first opportunity to properly develop these transitional services in an efficient manner which will lead to better patient outcomes and a more effective use of clinical staff.

### 1.1.3 Reduction in Hospital Acquired Infection (HAI)

Hospital Acquired Infection (HAI) is a major problem within modern clinical practice. There are a number of factors associated with increased HAI rates some of which relate to behaviours (staff & patients) and some of which relate to hospital design. It is well recognised however that good design can in turn influence behaviours. The infection control team have been closely involved throughout the design process. Design of the hospital is following the Department of Health Primary Guidance, Infection Control in the Built Environment (2002) to ensure a robust and consistent approach to HAI prevention and to demonstrate commitment to improving patient safety. Prevention of infection contributes to more effective healthcare which in turn aids productivity as delayed discharges and the requirement for further clinical interventions are reduced.

The presence of 100% single room with toilet / shower en-suite accommodation in ward areas will reduce HAIs by providing physical separation between patient beds and also greater flexibility in being able to isolate infectious patients. Any patient with an infectious (or potentially infectious) illness will always be in a single room. At the present time, healthcare workers often have to move patients from an open ward to a single room when infection becomes evident. This can sometimes require a patient to be moved to another ward or even to a single room in another different specialty area. Single room accommodation (as planned in this development) will result in better overall clinical care and outcomes with less patient (and carer) stress as well as more efficient use of healthcare workers' time

Behavioural issues which impact upon HAI rates include factors such as good hand hygiene and appropriate antibiotic use. Appropriate antibiotic use can be effected by proper use of clinical guidelines and good pharmacy support. The design of the new South Glasgow Hospitals includes a Medicines Management facility in all key clinical areas.

Hand hygiene is in part about staff behaviour however this is also influenced by making appropriate hand washing facilities available. Infection control measures in general and hand washing facilities in particular are a high priority within the design process. Every ward bed room and clinical area will have a clinical wash hand basin.

## 1.2 SUSTAINABILITY OF SERVICES – (CONSOLIDATION OF SERVICES)

The new adult and children's hospitals will allow:

a) the children's services at Yorkhill Hospital to transfer onto the Southern General Hospital site
b) adult inpatient services from 3 sites, the Western Infirmary, Victoria Infirmary and Southern General Hospital to consolidate onto a single site at the Southern General Hospital site.

This will ensure continuing sustainability of clinical services, optimise the use of resources and enhance clinical standardisation. These are described in more detail below.

### 1.2.1 Ensuring continuing sustainability of clinical services

There are a number of challenges around sustaining present clinical services. Some of these challenges are around delivering national clinical targets such as waiting times guarantees and the 4-hour Emergency Department wait standard. There are additional challenges around maintaining clinical staff rotas that are both European Working Times Directive (EWTD) compliant and, in the case of medical staff, compliant with the principles associated with Reshaping the Workforce (formally Modernising Medical Careers (MMC)). Bringing together the three adult hospitals onto one site will allow consolidation of a number of important clinical specialties (including A&E, Critical Care, theatres, renal, vascular surgery and Imaging) with resulting economies of scale. The number of staff rotas can be reduced and also the intensity of work associated with these rotas facilitating sustainability around both EWTD and Reshaping the Workforce.

The consolidation of services into a new build will allow more efficient working practices to be developed ensuring sustainability of service, these are discussed in more detail under 'performance Improvement'

### 1.2.2 Optimal use of resources

Bringing three adult hospitals onto one site affords significant economies of scale benefits including better use of equipment and physical resources. For example there will only be one Emergency Department compared with three at present. The same applies to theatres, critical care and Imaging, all of which will reduce from 3 to 1 sites. This rationalisation onto one site will be of particular benefit with respect to out of hours cover and extended day working along with the highlighted more efficient use of equipment.

Keeping a separate adult and children's hospital identity is important as both groups have very different physical and emotional healthcare needs. There are however some key adjacencies which support shared working under certain circumstances. The adult and children's Emergency Departments are sited side by side and, although physically separate, can support joint working in cases of major incident. Similarly chemical decontamination facilities are situated between the adult and children's Emergency Department entrances and are designed to be shared.
Careful co-location of departments is also important in providing contingency capacity. As an example; the adult and children's imaging departments are co-located which, in addition to providing contingency capacity for each hospital, also allows the potential for out of hours imaging rotas to be amalgamated.
There a number of other facilities and services which are shared such as the energy centre, pharmacy dispensary, FM systems and restaurant thereby supporting optimal resource utilisation

### 1.2.3 Clinical Governance / Standardisation

Standardised approaches to clinical care are difficult to achieve across multiple sites. This is due both to cultural differences amongst institutions as well as differences in the physical layouts of facilities. Introducing models of best practice in medical care and sustaining them remains challenging. By moving to a large single site facility standardised approaches will be easier to develop, institute and sustain. Evaluation of clinical and other performance outcomes will also be easier with less duplication of effort involved.

## 1.3 PERFORMANCE IMPROVEMENT

### 1.3.1 General Issues

HEAT (Health improvement, Efficiency, Access, Treatment) targets for the time taken from General Practitioner referral to institution of treatment for cancer and other services require to be met by 2011. The new South Glasgow hospitals development will ensure the sustainability of these targets and the ability to meet future targets by supporting improved ways of working, creating more capacity through more efficient working and more effective patient pathways. The aim being to provide timely and fit for purpose emergency and elective care.

The separation of emergency from elective care will support better patient throughput/bed occupancy by better avoiding peaks of emergency activity disrupting elective work.

Bringing together three hospitals onto a single site better supports service re-design and re-configuration. This re-design in turn will support the implementation of the planned future bed model. This will be sustained both by efficiencies within overall lengths of stay and by better alignment of bed numbers to meet specialty requirements.

### 1.3.2 Performance Improvement – Emergency Activity

The large number of emergency and elective admissions that will result from consolidation from three hospitals onto one site gives the opportunity to further develop 24/7 specialist rotas. From a patient perspective this means better clinical care with access as early in the journey as possible to the appropriate specialist which will be associated with earlier and more focussed investigation and treatment plans. There is good evidence available to show that specialists (compared to generalists) will use clinical resources (such as diagnostics) more efficiently and institute treatment/management plans earlier. There is also evidence that specialist involvement is associated with a shorter length of stay and a greater use of out-patient care. All of these factors will allow more efficient working practices to be developed and enhanced and support future workforce planning and bed modelling profiles.

The new Acute Assessment Unit model supports future work that will be carried out around admission avoidance. The development of a dedicated AAU Outpatient Area provides a focus for the provision of a greater proportion of ambulatory care. This may avoid the need for admission for a number of well defined patient groups such as patients with DVT, low risk pulmonary embolism, low risk GI bleed and patients who require IV antibiotic therapy. Earlier patient discharge can often be effected where appropriate and timely (early) outpatient specialist review is available. The AAU Outpatient Area provides a locus for this activity without impacting on the main elective outpatient activity happening elsewhere in the hospital.

### 1.3.3 Performance Improvement – Elective Activity

The Day of Admission facility in the Theatres Complex will allow patients to be admitted straight to theatre on day of their surgery (rather than going first to a ward area). This will streamline the patient journey and reduce overall length of stay. The Day of Admission facility

allows wards to work more efficiently by maintaining the focus on discharging patients during the first part of the morning rather than having to combine the patient discharge process with dealing with new admissions.

The General Outpatient Clinic area in conjunction with the Medical Day Unit and Pre-Operative Assessment Unit will also provide opportunities to streamline patient flows, by for example streamlining testing/diagnostics to avoid unnecessary “return” appointments

### 1.3.4 Performance Improvement – Facilities Management (FM)

The planned introduction of Automated Guided Vehicles (AGVs) and the (underground) physical link between the Facilities Management yard and the new hospitals will increase the efficiency and reliability of supplies delivery and waste removal. The latter will also reduce the risk from moving and handling injuries .

The installation of a pneumatic tube between the hospital departments and the laboratory building will allow high speed material transport of specimens which will facilitate faster turn-around of diagnostic tests. This system can also be used for delivery of discharge medicines to ward areas and support earlier in the day discharges.

A reduction in the number of hospital sites will facilitate a reduction in both maintenance costs and site management costs. Moving from Victorian buildings to a new build will allow sustainability and green issues to be met and savings in energy efficiency.

### 1.3.5 Performance Improvement – Information Technology (IT)

Effective IT will also support effective working. The new hospitals development is fully IT networked with appropriate provision of hardwired and wireless technology. This will support paperless/lite working. This is described in more detail in section (1.8).

## 1.4 PHYSICAL ENVIRONMENT

### 1.4.1 Physical Environment – General Issues

The new South Glasgow hospitals development is based upon a purpose built design which, through input of staff users and patient representatives, is fit for purpose and better able to address the priorities in ‘The Healthcare Quality Strategy for NHS Scotland’ as described below.

The provision of 100% single rooms in ward areas will provide the privacy and space to allow clear communication and discussion between the clinician and patient supporting shared decision making in treatment. Care has been taken within the single room design to allow optimum patient observation for staff but still maintain appropriate patient privacy.

The Design of the building and careful selection of materials and will make the cleaning and maintenance of the building easier and improve the health and safety of patients and staff and reduce the risk of Hospital Acquired Infection.

Detailed planning around security of entrances and internal corridors with appropriate use of “swipe card” access doors, the setting up of areas that are only accessible to patients and clinical staff, use of CCTV and the potential to lock down clinical areas out of hours will enhance security for patients and staff.

### 1.4.2 A Healing Environment

The new facilities will provide a modern environment with good levels of natural light and ventilation in an aesthetically pleasant setting with amenities both internal and external to the buildings.

A Design and Healthy Strategy Group has been formed to develop and implement a strategy to deliver a healthy and therapeutic environment for the new South Glasgow Hospitals including building design and healing environment, interior design and landscaping, way finding, architectural elements and integrated art. This will ensure a pleasant therapeutic environment for patients and visitors and a positive working environment for staff encouraging retention

New hospital buildings which have been designed to maximise easy way finding which will enhance the patient/visitor/carer experience and reduce stress. For example the shape of the buildings and planned landscaping will provide intuitive way finding to the main entrances, this will be enhanced by clear signage, and lighting. Once inside the main entrance there are receptions desks strategically placed to allow immediate access to information. Key routes through the hospitals will be land marked by art or signature pieces. Exits from the lifts on each floor although similar, will be individually land marked to orientate visitors through the building.

The children's hospital in response to parent/carers feedback, provides an overnight stay facility for parents by each bed, showers and also kitchen facilities for parents to make beverages and snacks.

## 1.5 HUMAN RESOURCES

As part of the development of the new South hospitals we anticipate some real tangible benefits for the workforce. The new state-of-the-art facilities will be key to attracting potential employees to NHSGGC and retaining existing staff. The ability to attract new employees will be particularly helpful in recruiting for the new roles – particularly those at levels three and four of the career framework which have been developed in partnership with local education providers and other roles developed as part of the redesign of services and working towards the aim of making the NHS an employer of choice as part of *A Force for Improvement: The Workforce Response to Better Health, Better Care.* Together with the new facilities and modern equipment the South Glasgow site will also be shared with Glasgow University. This will enhance teaching, research and play a significant role in attracting and retaining high-quality staff in all disciplines.

The design of the new adult hospital provides single-bedded rooms for all patients. This model increases observation of patients from appropriate staff areas. Similarly, staff absence caused by musculoskeletal problems from manual handling and lifting of patients should decrease given the introduction of assisted handling and moving hydraulics in each patient bedroom thereby reducing the need for staff to complete the majority of moving and handling manoeuvres.

Consolidating the workforce onto fewer sites delivers benefits to workforce utilisation, allows for rationalisation of existing rotas, the introduction of new work patterns, reducing the number of unsocial hours required to be worked and supporting the choice around work/life balance. The consolidation also increases the likelihood that doctors will be able to work in a team environment within their own specialities, provides opportunities to redesign services based on best-practice from across existing sites and reduces the need for inter-site travel.

The new South hospitals will have a dedicated transport hub and by working with local public transport providers the Board's aim to develop a transport plan to ensure as many members

of staff as possible are able to reach the new hospitals by public transport. This will have associated environmental benefits and be an incentive to staff to leave their cars at home.

Evidence from similar builds, for example our own ambulatory care hospitals recognises there can be real benefits to staff morale by working in a purpose-built facility with large, open areas for meeting colleagues. With the inclusion of the park just outside the adult hospital this will provide space for staff to relax and unwind. Similarly, with concentrating staff on fewer sites it will enhance medical staff rotas, offer them more opportunity to share expertise and work in a multi-disciplinary environment.

Staff involvement in the design process has been beneficial as they have been fully consulted on critical design elements, for example the layout of patient rooms and have had the opportunity to feedback on areas where further improvements could be made. This involvement will result in a hospital designed from the ground-up to meet the needs of patients and develop good workflows and environment for staff.

## 1.6 ENVIRONMENT CONSIDERATIONS

Importantly a new build will provide opportunities to address environmental considerations maximising energy efficiency. Energy consumption and carbon emissions were considered in terms of evaluating building performance during the tender stage. NHS GG&C have worked in association with the Carbon Trust and Sustainability Glasgow to set demanding performance targets, and in conjunction with the delivery partner, will deliver a beacon development of sustainability. In more detail the New South Glasgow Hospitals will deliver the following benefits in respect of the environment.

### 1.6.1 Reduced Carbon Output

The Operational Carbon Design target of this facility is 55% lower than that expected of an average Healthcare site. This equates to annual saving of over 5,000 tonnes of CO2 compared to an existing Healthcare site which should go some way to meeting the Health Board's obligations under the Climate Change Act (Scotland).

### 1.6.2 Reduced Energy Costs

The Demonstrated Energy costs target of the New Adult and Children's Hospital are 60% lower than a traditional comparable existing hospital,

### 1.6.3 Quality User Environment

The Brookfield bid has demonstrated how the New Hospitals will achieve an "Excellent" rating under the BREEAM Healthcare Assessment to ensure the highest quality of user environment and amenity for patients, visitor's and staff.

## 1.7 ENHANCED LINKS WITH THE UNIVERSITY

In addition to their primary clinical service role, the new South Glasgow Hospitals will also have a major education role. This will lead to a further enhancement of links with local universities (particularly Glasgow & Caledonian Universities) as well as consolidation of existing academic links.

Consolidating three hospitals onto one site brings a number of opportunities from an education perspective. These opportunities might be considered both from a staff perspective and from a research opportunity perspective.

From a staff perspective, clinical academics currently based in the Western Infirmary will have their clinical base in the new South Glasgow Hospital. This relocation will provide staff with critical co-location with other academic staff – including existing academic staff in neurology and neurosurgery already on the Southern General campus – as well as other clinical staff in multiple different specialties. This enhances opportunities for collaboration in both research and teaching.

From a research perspective bringing patients, whose attendance is currently split across three hospital sites, onto a single site provides an enhanced opportunity for clinical research. A number of clinical research networks are already in place. These networks will be strengthened by virtue of their geographic co-location.

A site has been identified adjacent to the new South Hospitals build that has been earmarked for a new build for the University of Glasgow. This will potentially provide laboratory space and large lecture theatre space on site. The presence of clinical academic staff and the large volume of clinical activity that will take place will act as stimulus to support the business case for this development.

The new South Glasgow Hospital has also been designed to support teaching and training. Large meeting/seminar rooms are situated throughout the podium and the ward tower block. These areas will be particularly suitable for undergraduate and postgraduate teaching. All seminar rooms will be fully equipped for teaching and have appropriate IT links provided.

In addition to the presence of academic clinical staff and the bringing together of large teams of clinical specialists; the large number of patients will provide an unrivalled opportunity for clinical teaching at undergraduate and postgraduate level for a number of disciplines including medicine, nursing and allied health professions.

## 1.8 IT

Technologically advanced IT networks providing hardwired and wireless infrastructure are included throughout the hospitals providing the backbone for developing systems. This will support the implementation of a paper-lite environment which will allow patient information to be accessed and inputted at the point of care , the IT infrastructure will also facilitate telemedicine initiatives enhancing teaching and information sharing.

## 1.9 ACCESSIBILITY TO HOSPITAL AND COMPLIANCE WITH TRAVEL PLAN

The Design of the New Hospitals and the strategy and funding underpinning the Travel Plan, will deliver a number of benefits to the Hospitals communities and the Greater Govan area. A key element of the design of the new Hospitals is a high quality public transport arrival space adjacent to the main entrances of both hospitals. This will provide better access to the hospitals by reducing walking time from bus stance to front door. In particular, those with restricted mobility or parents with children in buggies will benefit. The Arrival Space will also have high quality shelters as well as waiting areas inside the Hospitals. Both these waiting areas will have real time information allowing passengers to know exactly when a bus service is arriving. These reduce exposure to the cold or rain enhancing the travel experience as well as avoiding damage to health. The investment in this space allows for consideration of a Quality Bus Partnership to be developed. This could further enhance the quality of the vehicles using the Arrival Space by agreeing standards relating to driver behaviour, cleanliness, punctuality and engine emissions. Improved confidence in public transport, more patronage, improved air quality could all follow.

The Travel Plan makes generous provision for improved public transport to and from the site. The provision of Fastlink or the alternative Super Southern bus will enhance connectivity

between Glasgow City Centre, Govan Underground, the New Hospitals and Braehead Shopping Centre. The service will provide improved connectivity within the City Centre at Buchanan Street Station, Queens Street and Central Stations, thus enhancing access for those coming from outside Glasgow. This will be of particular benefit to parents and patients of the New Children's Hospital. As well as provide high quality public transport for staff, patients and visitors of the New Hospitals, this iconic bus service will help economic development in the Greater Govan area and access to employment. The significant financial investment in other bus routes will increase access to the site, reduce current journey times and improve DDA compliance through the tendering process.

The site car parking strategy will also bring major benefits to the current situation. The strategic aim of controlling peak hour access to the site will ensure that localised congestion is not exacerbated. Achieving this will require distribution of car parking permits in a way which provides a more equitable access to different grades of staff. Car sharing will be greatly enhanced by the provision of dedicated car parking spaces and short term social need will be better addressed by provision of bookable spaces. The Travel plan arrangements will also reduce nuisance parking outside the site by support for controlled parking. Cycling will be made more attractive by the design of bespoke bike shelters and provision of showering, changing and secure storage facilities. This will reduce localised congestion, help improve air quality, result in individual health gain by regular exercise. The financial contribution towards cycling paths will help integrate the site and the local community better into the Cycling Network and the Core Paths network. This will contribute to improved access to the area through better and safer cycle routes to and from the area.

## 1.10 COMMUNITY AND ECONOMIC BENEFITS

NHS Greater Glasgow and Clyde recognises within the current economic climate the need to utilise its infrastructure investment in South West Glasgow effectively to support and sustain business and jobs in the wider economy.

The redevelopment of the Southern General site is recognised by partners as a catalyst for broader economic and social regeneration, contributing positively to the physical development of the local area and contributing significantly to the South West economy and that of the wider locality.

NHS Greater Glasgow and Clyde continues to engage partners and communities in maximising the economic impact of its investment in the New South Glasgow Hospitals Campus.

Board Risk Register

Date Last Reviewed - 14th September 2010

***Appendix G***
***Risk Registers***

| No | CATEGORY | Issue / requirement | Risk | Primary Owner: Board | Programme | Cost | MITIGATION: RISK CONTROL MEASURE | Post Control: LIKELIHOOD (1 5) | Post Control: COST IMPACT (1 5) | Post Control: PROGRAMME IMPACT (1 5) | Post Control: OVERALL RATING | Stages applicable | Probability | Frequency | Post Control Risk Value per stage £'s: Max | Avg | Min | Owner/ Leader | Action By Date | COMMENTS (Incl. notes on basis of quantification and valuation of risk provision) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| 1 | Access | Complying with Section 75/Transport strategy | If additional off site road or traffic works, not currently identified as part of masterplan, are required outwith the campus to comply with Planning Authority requirements then these will require to be designed and constructed | Yes | | | 1. Section 75 agreement signed off. | | | | | 1 | | | | | | | | No impact on Labs project |
| | | | | | | | | | | | | 2 | | | | | | | | No change |
| | | | | | | | | | | | | 3 | | | | | | | | |
| | | | | | | | | | | | | 3a | | | | | | | | |
| 2 | Commercial | Risk that lab design is not sufficiently developed at the stage tender submitted, i.e. Stage E / F | If the Labs design does not achieve Stage E/F design status (including Stage Building Warrant submission) at the time of contract award to allow construction to start as planned then potential for cost movement due to design development/clarifications post bid submission (GG&C has advised the need for a Compensation Event at contract award) | Yes | | | 1. Manage design process<br>2. Appropriate wordings in submission<br>3. Establish appropriate contingency | | | | | 1 | | | | | | | | Agreed to risk to be closed out |
| 3 | Commercial | Funding availability and cashflow | Disruption to construction activities | Yes | | | 1. Board will set up to fund bidders agreed programme 2. Board will liaise with Scottish government | | | | | 1 | | | | | | | | 1 ongoing risk re cashflow. Revised cashflow proposal to be discussed with BCL. |
| | | | | | | | | | | | | 2 | | | | | | | | See above |
| | | | | | | | | | | | | 3 | | | | | | | | See above |
| | | | | | | | | | | | | 3a | | | | | | | | See above |
| 4 | Commercial | Late payments by the employer | If Certified Payments are not paid within due timescale additional costs may arise | Yes | | | Board to put in place compliant payment process within the contract. | | | | | 1 | | | | | | | | No issues - Payment Process working well. Timeline working well. |
| | | | | | | | | | | | | 2 | | | | | | | | See above |
| | | | | | | | | | | | | 3 | | | | | | | | See above |
| | | | | | | | | | | | | 3a | | | | | | | | See above |
| 5 | Commercial | Inflation above the allowance in the contract | If inflation varies from the allowances in the accepted Target / Maximum Price then Compensation Event will be required to increase Target / maximum price | Yes | | | Appropriate indices to be included in contract | | | | | 1 | | | | | | | | Ongoing monitoring. DR presented a synopsis on potential risk on inflation for 09/10 to ASSB on 09/08/2010 |
| | | | | | | | | | | | | 2 | | | | | | | | See above |
| | | | | | | | | | | | | 3 | | | | | | | | See above |
| | | | | | | | | | | | | 3a | | | | | | | | See above |
| 6 | Commercial | Failure to achieve approvals at key dates and gateways FBC approval due to the Boards non performance | Delay to project and increased costs | Yes | | | Ensure programme dates are met by both parties and ensure approval processes are in place and closely monitored | | | | | 1 | | | | | | | | BCL to do lookahead and identify extra items which would be required if FBC for Hospitals is not achieved. Alternative Labs Specimen/Bloods delivery route may need to be identified if FBC for Hospitals not achieved (current proposal for Vacuum system delivery from hospitals) BCL lookahead will cover a) roads and infrastructure, b) tunnels, c) drainage, d) SW Land & SAS Land (£2m), e) Landscaping |
| | | | | | | | | | | | | 2 | | | | | | | | Have iden ified all the actions to complete FBC. FBC programme and tracker document in place |
| | | | | | | | | | | | | 3 | | | | | | | | |

Board Risk Register

Date Last Reviewed - 14th September 2010

| No | CATEGORY | Issue / requirement | Risk | Primary Owner: Board | Programme | Cost | MITIGATION: RISK CONTROL MEASURE | Post Control: LIKELIHOOD (1 5) | Post Control: COST IMPACT (1 5) | Post Control: PROGRAMME IMPACT (1 5) | Post Control: OVERALL RATING | Stages applicable | Probability | Frequency | Post Control Risk Value per stage £'s: Max | Avg | Min | Owner/ Leader | Action By Date | COMMENTS (Incl. notes on basis of quantification and valuation of risk provision) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | 3a | | | | | | | | |
| 7 | Character/ Innovation | Impact of change in Employers Requirements (space and design standards) | If the Board amend the Employers Requirements forming part of the ITPB then potential for<br>1. Re-design of affected elements<br>2. Re-work (if already constructed)<br>3. Poss ble adverse impact on programme<br>4. Poss ble cost impact | Yes | | | 1. Establish requirement to implement change<br>2. If change required, review with main contractor to determine most economic and effective means of implementation.<br>3. Optimism Bias as appropriate | | | | | 1 | | | | | | | | Signed off for Labs - Closed off |
| | | | | | | | | | | | | 2 | | | | | | | | Being managed hrough the 1:200 and 1:50 process. Any changes are managed through the Board's Change Control Process overseen by Chief Executive. Early warning process being utilised. |
| | | | | | | | | | | | | 3 | | | | | | | | |
| | | | | | | | | | | | | 3a | | | | | | | | |
| 8 | Character/ Innovation | The introduction and incorporation of changes to Scottish Government Health Department new requirements | 1. Re-design of affected elements<br>2. Re-work (if already constructed)<br>3. Adverse impact on programme<br>4. Cost impact | Yes | | | 1. Early identification<br>2. Concise brief for required changes<br>3. Decisions approved by acute directors as per the Change control process. | | | | | 1 | | | | | | | | Not aware of any issues |
| | | | | | | | | | | | | 2 | | | | | | | | Not aware of any changes to requirements hus far. Intensive Care design proposes removal of glass dividers. Early Warning process being utilised. |
| | | | | | | | | | | | | 3 | | | | | | | | |
| | | | | | | | | | | | | 3a | | | | | | | | |
| 9 | Construction | Archaeology - Impact due to significant find | If prior to or during construction activities an archaeological find is identified there may be<br>1. Delay to works within the vicinity of the find<br>2. Potential to delay overall project if found within area critical to the progress of the works | Yes | | | Examine historical records to determine likelihood of a significant find | | | | | 1 | | | | | | | | Closed off for Labs Project |
| | | | | | | | | | | | | 2 | | | | | | | | |
| | | | | | | | | | | | | 3 | | | | | | | | Ongoing risk. Further Site Investigation being undertaken to mitigate risk. |
| | | | | | | | | | | | | 3a | | | | | | | | |
| 10 | Construction | Archaeology - Impact due to small find | If prior to or during construction activities an archaeological find is identified there may be<br>1. Delay to works within the vicinity of the find<br>2. Potential to delay overall project if found within area critical to the progress of the works | Yes | | | Examine historical records to determine likelihood of a small find | | | | | 1 | | | | | | | | Closed off for Labs Project |
| | | | | | | | | | | | | 2 | | | | | | | | |
| | | | | | | | | | | | | 3 | | | | | | | | Ongoing risk. Further Site Investigation being undertaken to mitigate risk. Demolitions being progressed. |
| | | | | | | | | | | | | 3a | | | | | | | | |
| 11 | Construction | The impact of incorrect programme and cost estimates for decanting from existing premises due to board non performance | If the Surgical Block is not vacated within allowed timeframes to facilitate completion of Stage 3A works<br>1. Decant period extended with potential to delay subsequent operations<br>2. Potential for increased costs | Yes | | | 1. Early preparation of decant programme<br>2. Appropriate consultation and secure commitment and agreement of all relevant Stakeholders<br>3. Arrange appropriate briefing sessions and workshops in the period up to decant to re-affirm roles, responsibilities and timescales<br>4. Funding in place | | | | | 1 | | | | | | | | Not applicable for Labs Project - Closed off |
| | | | | | | | | | | | | 2 | | | | | | | | |
| | | | | | | | | | | | | 3 | | | | | | | | Ongoing risk however decant plan being progressed for consideration |
| | | | | | | | | | | | | 3a | | | | | | | | |
| 12 | Construction | Any unforeseen ground/site conditions under the footprint of existing facilities | If ground conditions encountered below demolished buildings vary significantly from that identified in the Site Investigation Report<br>1. Additional temporary works may be required<br>2. Additional excavations / fill may be required<br>3. A degree of redesign may be necessary<br>4. Adverse impact on programme<br>5. Additional costs | Yes | | | 1. Obtain complete SIs, review and undertake additional surveys as appropriate<br>2. Effective communication/ consultations with appropriate Stakeholders | | | | | 1 | | | | | | | | Not applicable for Labs Project - Closed off |
| | | | | | | | | | | | | 2 | | | | | | | | |
| | | | | | | | | | | | | 3 | | | | | | | | Residual risk remains as buildings currently located on footprint for new hospitals. The SI work has been programmed to take place as soon as the demolitions have been completed. Report awaited from current SIs. |
| | | | | | | | | | | | | 3a | | | | | | | | |
| | | | If ground conditions encountered vary | | | | | | | | | 1 | | | | | | | | No further risks for Labs. Ongoing review and continuous monitoring |

| No | CATEGORY | Issue / requirement | Risk | Primary Owner: Board | Programme | Cost | RISK CONTROL MEASURE | MITIGATION | Post Control: LIKELIHOOD (1 5) | Post Control: COST IMPACT (1 5) | Post Control: PROGRAMME IMPACT (1 5) | Post Control: OVERALL RATING | Stages applicable | Probability | Frequency | Post Control Risk Value per stage £'s: Max | Avg | Min | Owner/ Leader | Action By Date | COMMENTS (Incl. notes on basis of quantification and valuation of risk provision) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | | | | | | | | | | |
| 13 | Construction | Unforeseen site conditions | significantly (mine workings, underground structures etc) from that identified in the Site Investigation Report then<br>1. Additional temporary works may be required<br>2. Additional excavations / fill may be required<br>3. A degree of redesign may be necessary<br>4. Adverse impact on programme<br>5. Additional costs | Yes | | | 1. Obtain complete SIs, review and undertake additional surveys as appropriate<br>2. Effective communication/ consultations with appropriate Stakeholders | | | | | | 2 | | | | | | | | |
| | | | | | | | | | | | | | 3 | | | | | | | | Further SIs being undertaken. Summary report recieved for Board review. |
| | | | | | | | | | | | | | 3a | | | | | | | | |
| 14 | Construction | The impact of "Compensation Events" to the Contractor (variations) | Compensation Events issued changing the Employers Requirements will require to be funded by the Board Potential for delay and additional costs | Yes | | | 1. Minimise potential impact of CE by effective dialogue<br>2. Ensure change is minimised via robust GG&C internal control process<br>3. Robust and timely change control process | | | | | | 1 | | | | | | | | Ongoing monitoring. Change control process continuing to be managed through Chief Executive and Chief Operating Officer. Weekly joint review undertaken by NHS & BCL |
| | | | | | | | | | | | | | 2 | | | | | | | | Change control process being managed through Chief Executive and Chief Operating Officer.Weekly joint review undertaken by NHS & BCL |
| | | | | | | | | | | | | | 3 | | | | | | | | As above |
| | | | | | | | | | | | | | 3a | | | | | | | | |
| 15 | Construction | Discovery of unknown major services within site boundary | If an unidentified service is discovered during the works resulting in<br>1. Service str ke causing potential injury<br>2. Impact on buildings supplied by the service<br>3. Service diversion required<br>4. Additional costs<br>5. Adverse impact on programme | Yes | | | 1. Early surveys, check for presence of live services<br>2. Consider re-survey post demolitions, pre FBC to mitigate any potential impact upon construction programme and cost<br>3. Robust operation of permit to dig regimes | | | | | | 1 | | | | | | | | Closed off |
| | | | | | | | | | | | | | 2 | | | | | | | | |
| | | | | | | | | | | | | | 3 | | | | | | | | Completed further survey work and gas main located. Radar scan completed |
| | | | | | | | | | | | | | 3a | | | | | | | | |
| 16 | Construction | Impact of delay in gaining access to the site | If the Board fail to provide access to the site for the Contractor in accordance with the ITPB documents then there may be potential for delay to programme | Yes | | | 1. Ensure all legal agreements are concluded at earliest possible date.<br>2. Ensure all enabling works are completed | | | | | | 1 | | | | | | | | Not applicable for Labs Project |
| | | | | | | | | | | | | | 2 | | | | | | | | |
| | | | | | | | | | | | | | 3 | | | | | | | | On-going monitoring of demolitions programme. Now managed and controlled by BCL |
| | | | | | | | | | | | | | 3a | | | | | | | | |
| 17 | Construction | The impact of changes in VAT | VAT changes from the HM Treasury guidance current at date of Tender result in increased costs | Yes | | | 1. Seek appropriate advice from specialists (E&Y)<br>2. Review and monitor potential change and undertake some senario planning | | | | | | 1 | | | | | | | | Paper presented to August ASSB meeting |
| | | | | | | | | | | | | | 2 | | | | | | | | As above |
| | | | | | | | | | | | | | 3 | | | | | | | | As above |
| | | | | | | | | | | | | | 3a | | | | | | | | As above |
| 18 | Construction | The non-realisation of VAT re-claim and introduction of new statutory costs | VAT changes from the HM Treasury guidance current at date of Tender result in increased costs | Yes | | | 1. Seek appropriate advice from specialists<br>2. Review and monitor potential change | | | | | | 1 | | | | | | | | External advisors (Ernst & Young) and Board finance colleagues continuing to identify and reclaim VAT where appropriate |
| | | | | | | | | | | | | | 2 | | | | | | | | As above |
| | | | | | | | | | | | | | 3 | | | | | | | | As above |
| | | | | | | | | | | | | | 3a | | | | | | | | As above |
| | | | If asbestos is identified in existing underground ducts / buildings identified for demolition then | | | | 1. Risk assessments and works procedures to take | | | | | | 1 | | | | | | | | Closed off for Labs Project. |
| | | | | | | | | | | | | | 2 | | | | | | | | |

Board Risk Register

Date Last Reviewed - 14th September 2010

| No | CATEGORY | Issue / requirement | Risk | Primary Owner: Board | Programme | Cost | MITIGATION: RISK CONTROL MEASURE | Post Control: LIKELIHOOD (1 5) | Post Control: COST IMPACT (1 5) | Post Control: PROGRAMME IMPACT (1 5) | Post Control: OVERALL RATING | Stages applicable | Probability | Frequency | Post Control Risk Value per stage £'s: Max | Avg | Min | Owner/ Leader | Action By Date | COMMENTS (Incl. notes on basis of quantification and valuation of risk provision) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| 19 | Construction | Asbestos (unforeseen) | 1. Potential affect on programme if not identified in good time<br>2. Increased costs due to additional work or required upgrade | Yes | | | cognisance of possible environmental hazards<br>2. Effective liaison with GG&C re possible measures required<br>3. Review of site information | | | | | 3 | | | | | | | | May be residual risk re SAS building and duct work under car-park. Demolition survey works completed. |
| | | | | | | | | | | | | 3a | | | | | | | | |
| 20 | Construction | Additional areas of affected Japanese knotweed | If additional areas of Japanese knotweed are identified then potential for additional works, delay, costs, adverse impact upon critical path | Yes | | | 1. Obtain complete SIs, review and undertake additional surveys as appropriate.<br>2. Specialist contractors engaged to eradicate and control JK | | | | | 1 | | | | | | | | Closed off for Labs Project |
| | | | | | | | | | | | | 2 | | | | | | | | |
| | | | | | | | | | | | | 3 | | | | | | | | Residual area of knotweed iden ified on Hospitals construc ion site at perimeter fencing. Board instructed specialist contractor to spray affected area. Ongoing monitoring and potential removal. |
| | | | | | | | | | | | | 3a | | | | | | | | |
| 21 | Engineering | Impact of enabling demolition works on main contract works | If demolition works are not undertaken and completed by stated dates then Stage 3 site handover may not take place as per contract dates. Potential for delayed start, ground clearance in particular, and impact upon overall completion date | Yes | | | 1. Contractor assistance to co-ordinate and programme all interface works within the campus<br>2. Continue effective dialogue with key Stakeholders<br>3. Contractor assistance with interface works<br>4. Engage specialist supply chain for sub station works | | | | | 1 | | | | | | | | Closed off for Labs Project - no impact |
| | | | | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | 3 | | | | | | | | Contractor managing these works. Ongoing |
| | | | | | | | | | | | | | | | | | | | | |
| 22 | Construction | Relocation of orange aerial tower to accommodate land purchase | If third part works to relocate telecommunications mast is not undertaken by due dates then may impact on programme | Yes | | | 1. Engage specialist contractors.<br>2. Manage land purchases | | | | | 1 | | | | | | | | Closed off for Labs Project - no impact |
| | | | | | | | | | | | | 2 | | | | | | | | N/A |
| | | | | | | | | | | | | 3 | | | | | | | | Closed off for Hospitals Project as Orange Tower will not be relocated |
| | | | | | | | | | | | | 3a | | | | | | | | N/A |
| 23 | Design | Planning authority don't comply with statutory response times when in receipt of correctly completed Application | 1. Delay to programme<br>2. Additional costs<br>3. Any inflation/LADs<br>4. Delay to Roads Construction Consent<br>5. Delay in occupying the buildings | Yes | | | 1. Ensure timely & complete submission to planning<br>2. Board apply political influence<br>4. Anticipate changes in planning conditions<br>5. Appropriate wordings in submission | | | | | 1 | | | | | | | | Closed off for Labs Project - no issues |
| | | | | | | | | | | | | 2 | | | | | | | | Close off - All complete |
| | | | | | | | | | | | | 3 | | | | | | | | All timescales met by planners up to June 2010. Final approval anticipated end September 2010. |
| | | | | | | | | | | | | 3a | | | | | | | | |
| 24 | Design | Additional requirements for Police counter terrorism | 1. Delay to programme<br>2. Additional costs due to design development/ clarifications post bid submission | Yes | | | 1. Manage design process with Police involvement<br>2. Appropriate wordings in submission<br>3. Establish appropriate contingency | | | | | 1 | | | | | | | | Ongoing monitoring and discussion. 2 issues raised at recent meeting i.e. a) management of vehicles entering service yard and b) vehicles entering service yard from exit point. |
| | | | | | | | | | | | | 2 | | | | | | | | Impact on BREEAM points to be managed |
| | | | | | | | | | | | | 3 | | | | | | | | BCL and NHS Team to meet to discuss impact for/on hospitals. |
| | | | | | | | | | | | | 3a | | | | | | | | |
| 25 | Design | Unforeseen additional Equipment requirements | Equipment requirements of Board not fully developed and will evolve over time effecting design and procurement | Yes | | | 1. Board to ensure timely issue of equipment with comprehensive details.<br>2. Early involvement with specialist Board staff | | | | | 1 | | | | | | | | Residual risk - ongoing review. |
| | | | | | | | | | | | | 2 | | | | | | | | Being managed hrough the 1:50 process. Also looking at specialist equipment requirement. |
| | | | | | | | | | | | | 3 | | | | | | | | |
| | | | | | | | | | | | | 3a | | | | | | | | |
| 26 | Design | Car Parking strategy changes | If the 3500 spaces is reduced then additional off site public transport contributions may be required | Yes | | | | | | | | 1 | | | | | | | | No applicable to Labs Project |
| | | | | | | | | | | | | 2 | | | | | | | | |
| | | | | | | | | | | | | 3 | | | | | | | | Ongoing monitoring. No plan to change strategy |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | 3a | | | | | | | | |
| 27 | Design | Level of information provided about ICT requirements | If the brief in the Employers Requirements changes the potential for cost movement due to design development/clarifications post bid submission | Yes | | | 1. Manage design process<br>2. Appropriate wordings in submission<br>3. Establish appropriate contingency | | | | | 1 | | | | | | | | Additional infrastructure being requested. Needs to be considered by COO prior to being progressed through Board's Change Control Process. |
| | | | | | | | | | | | | 2 | | | | | | | | |
| | | | | | | | | | | | | 3 | | | | | | | | Requirements in ERs exactly as requested. Confusion over what ICT now require and also in respect to loadings. IT needs to consult COO prior to any work commencing |
| | | | | | | | | | | | | | | | | | | | | |
| 28 | Design | Lifts Strategy (Lab) | If the FM strategy changes post contract award additional lifts in the Labs / FM building may be required. Potential for cost movement due to design development/clarifications post bid submission | Yes | | | 1. Manage design process<br>2. Appropriate wordings in submission<br>3. Establish appropriate contingency | | | | | 1 | | | | | | | | Closed off for Labs Project |
| | | | | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | | | | |
| 29 | Engineering | The Board do not provide a contract programme for the 33kV sub-station by the required date which is when the board approve the stages 1, 2, 3 & 3a | If the Board fail to accept the Contact for the new primary sub-station by the due date then it will not be available for new Labs commissioning | Yes | | | 1. Early dialogue and confirmation of brief<br>2. Robust design<br>3. Possible use an Independent DNO | | | | | 1 | | | | | | | | Procurement of 33KVA Substation being actively managed an on programme. Agreed that Board have accepted contract therefore risk to be closed out. |
| | | | | | | | | | | | | 2 | | | | | | | | |
| | | | | | | | | | | | | 3 | | | | | | | | Maybe an issue re cladding should FBC not be achieved. |
| | | | | | | | | | | | | 3a | | | | | | | | |
| 30 | Engineering | The requirements of site wide engineering strategy change | If Board change Employers Requirements for site wide energy strategy then may be re-design, potential for additional cost | Yes | | | 1. Early dialogue and confirmation of brief<br>2. Effective EWN/CE process, if applicable | | | | | 1 | | | | | | | | |
| | | | | | | | | | | | | 2 | | | | | | | | |
| | | | | | | | | | | | | 3 | | | | | | | | Confirmed strategy in ERs and no changes being requested |
| | | | | | | | | | | | | | | | | | | | | |
| 31 | Legal | Delay to land acquisition to secure the Scottish Water land | 1. Delay to project programme<br>2. Cost impact<br>3. Re-design to accommodate road infrastructure | Yes | | | 1. Ensure all legal agreements are concluded at earliest possible date with SW<br>2. Business case concluded and approved | | | | | 1 | | | | | | | | Closed off for Labs Project - no impact |
| | | | | | | | | | | | | 2 | | | | | | | | District Valuaters valuation received by Board. CLO progressing legal works. Progressing well |
| | | | | | | | | | | | | 3 | | | | | | | | |
| | | | | | | | | | | | | 3a | | | | | | | | |
| 32 | Legal | Delay to land acquisition to secure the Ambulance Service land | 1. Delay to project programme<br>2. Cost impact<br>3. Re-design to accommodate Car park 2 | Yes | | | 1. Ensure all legal agreements are concluded at earliest possible date with SAS<br>2. Business case concluded and approved | | | | | 1 | | | | | | | | Closed off for Labs Project - no impact |
| | | | | | | | | | | | | 2 | | | | | | | | Being progressed by CLO. Progressing well. |
| | | | | | | | | | | | | 3 | | | | | | | | |
| | | | | | | | | | | | | 3a | | | | | | | | |
| | | Potential for impact of legislative or regulatory | Change in law/ regulations gives a potential for | | | | 1. Establish requirement to implement change<br>2. If change required, review with main contractor to | | | | | 1 | | | | | | | | Monitoring BREEAM progress. Building warrants submitted so should "lock-down" Labs Project against future changes |
| | | | | | | | | | | | | 2 | | | | | | | | |

Board Risk Register

Date Last Reviewed - 14th September 2010

| No | CATEGORY | Issue / requirement | Risk | Primary Owner: Board | Programme | Cost | MITIGATION: RISK CONTROL MEASURE | Post Control: LIKELIHOOD (1 5) | Post Control: COST IMPACT (1 5) | Post Control: PROGRAMME IMPACT (1 5) | Post Control: OVERALL RATING | Stages applicable | Probability | Frequency | Post Control Risk Value per stage £'s: Max | Avg | Min | Owner/ Leader | Action By Date | COMMENTS (Incl. notes on basis of quantification and valuation of risk provision) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | | | | | | | | | | | | |
| 33 | Legal | change, e.g.<br>1. Green issues<br>2. Environmental Planning standards | Change in law/ regulations gives a potential for late change, re-design, cost and delay | Yes | | | determine most economic and effect ve means of implementation<br>3. Progress design in line with current environmental<br>4. Design build in line with BREEAM excellent rating | | | | | 3 | | | | | | | | No forthcoming changes identified. Building Warrant will be submitted in due course which will then "lock-down" the design to any forthcoming changes. Continuing to monitor |
| | | | | | | | | | | | | 3a | | | | | | | | |
| 34 | Operational | Impact on construction with day to day operation of existing hospital and interface with facilities manager | 1. Patient care effected.<br>2. Health & safety implications.<br>3. Public perception damaged<br>4. Traffic issues<br>5. Cost & Programme delays | Yes | | | 1. Close liaison between contractor and Board<br>2. Appropriate management procedures in place<br>3. Communication plan for stakeholders<br>4. Key staff involved in planning to reduce disruption | | | | | 1 | | | | | | | | Weekly Construction Interface Group meeting.Key part of planning. |
| | | | | | | | | | | | | 2 | | | | | | | | |
| | | | | | | | | | | | | 3 | | | | | | | | Weekly Construction Interface Group meetings will continue. Regular Logistics Group meetings to be established. |
| | | | | | | | | | | | | 3a | | | | | | | | |
| 35 | Operational | Operation of Helipad during lab construction disrupting works | 1. Delay to Construction Programme resulting from an increase of landings per year above that of the stated 400<br>2. Additional costs due to programme delay | Yes | | | 1. Agree cost allowance.<br>2. Agree management plan to reduce disruption | | | | | 1 | | | | | | | | Helicopter Management Plan working well and regularly reviewed. |
| | | | | | | | | | | | | 2 | | | | | | | | |
| | | | | | | | | | | | | 3 | | | | | | | | Helicopter Management Plan will be reviewed/revised to cover the Adult and Children's Hospital construction site |
| | | | | | | | | | | | | 3a | | | | | | | | |
| 36 | Performance | Any unexpected changes in medical technology causing work changes | If there are changes in medical technology requiring changes to Employers Requirements there may be<br>1. Re-design to accommodate<br>2. Re-work (if already constructed)<br>3. Poss ble adverse impact on programme<br>4. Poss ble cost impact | Yes | | | 1. Flexible building design to accommodate technological change/ advances<br>2. Appropriate supplier and product selection | | | | | 1 | | | | | | | | Procurement risk re track analysers outstanding. Likely to be resolved Feb 2011 |
| | | | | | | | | | | | | 2 | | | | | | | | Any changes will con inue to be explored and where necessary will be dealt with through he Board's Change Control Process. |
| | | | | | | | | | | | | 3 | | | | | | | | As above |
| | | | | | | | | | | | | 3a | | | | | | | | |
| 37 | Programme | Approval process / sign off of equipment plans & RDS if Board don't comply with agreed timescales | 1. Delay to design, construction & procurement, Reviewable Design Data (RDD) process. 2. Increased costs & delay to project. | Yes | | | 1. Contractor and Board to agree and work within the approval and sign-off process<br>2. Good communication plan established | | | | | 1 | | | | | | | | RDS signed off. RDD process due to commence thereafter continual montoring. |
| | | | | | | | | | | | | 2 | | | | | | | | Programmes prepared and regularly reviewed and agreed |
| | | | | | | | | | | | | 3 | | | | | | | | |
| | | | | | | | | | | | | 3a | | | | | | | | |
| 38 | Space | An increased demand for patient services from that agreed | If demand assessment changes there may be an impact on Employers requirements resulting in 1. Departmental brief change<br>2. Extension to or partial closure of the building(s) | Yes | | | 1. Establish requirement to implement change<br>2. If change required, review with main contractor to determine most economic and effective means of implementation | | | | | 1 | | | | | | | | Closed off for Labs Project |
| | | | | | | | | | | | | 2 | | | | | | | | Any changes will con inue to be dealt with through the Board's Change Control Process. |
| | | | | | | | | | | | | 3 | | | | | | | | |
| | | | | | | | | | | | | 3a | | | | | | | | |
| 39 | Use | The non-realisation of existing equipment transfer into new facilities | 1. Costs associated with requirement to order new equipment<br>2. Delay if new equipment is not available within the required timescale | Yes | | | 1. Ongoing monitoring of schedule of equipment to be re-used to confirm continuing availability dates<br>2. Early identification of any additional equipment required as a result of non availability for transfer<br>3. Liaison with main contractor re back stop dates for delivery to site | | | | | 1 | | | | | | | | Ongoing work to identify New vs Newly purchased vs transfer for fume an safety cabinets to be concluded |
| | | | | | | | | | | | | 2 | | | | | | | | Ongoing management through Equipment Group |
| | | | | | | | | | | | | 3 | | | | | | | | |
| | | | | | | | | | | | | 3a | | | | | | | | |
| | | | | | | | 1. Ongoing monitoring of schedule of equipment to | | | | | 1 | | | | | | | | Closed off for Labs Project |

| | | | | | | | | | | | | 3a | | | | | | | | |
| 41 | 3rd Party Works | Potential for delayed completion of enabling works by others, eg:<br>1. Site clearance<br>2. Car Parks<br>3. Substation | Delayed start, ground clearance in particular, and impact upon overall completion date | Yes | | | 1. Liaise with contractor to co-ordinate and programme all interface works within the campus<br>2. Continue effective dialogue with key Stakeholders<br>3. Engage specialist supply chain for sub station works | | | | | 1 | | | | | | | | Closed off |
| | | | | | | | | | | | | 2 | | | | | | | | |
| | | | | | | | | | | | | 3 | | | | | | | | Ongoing site clearance planned for completion October 2010 |
| | | | | | | | | | | | | | | | | | | | | |
| 42 | Space | Gross floor area exceeds 166,958m2 + 0.05% | Gross floor area exceeds 166,958m2 + 0.05%, without change to net area requirement as a result of user input to design development | Yes | | | 1. Manage design process | | | | | 1 | | | | | | | | Design development process managed. 1:50 design review process ongoing. |
| | | | | | | | | | | | | 2 | | | | | | | | Continuing to be managed through ER's and design development and review process. |
| | | | | | | | | | | | | 3 | | | | | | | | |
| | | | | | | | | | | | | | | | | | | | | |

| Risk | | | Response | | | Residual Assessment | | | | Comments |
|---|---|---|---|---|---|---|---|---|---|---|
| **Item** | **Description** | **Risk Effect** | **Risk control measure or action taken to mitigate** | **Action Owner** | **When** | **P 1-5** | **I 1-5** | **PI Score** | **Strategy** | |
| B1 | Advance payments for material orders | Prices decrease; material wastage; storage costs; increased insurance costs | Prudent advance purchase of programme critical and cost sensitive materials for energy centre / equipment / etc | Brookfield | Stage 1 | 1 | 3 | 3 | Acceptable | In principle paper to be submitted to Board. |
| B2 | Availability of suitable labour resource and impact on procurement of various packages | Delay to the project and increased costs. | Ensure that labour resources are planned for through use of labour resource histograms etc. Ensure good relationships with DWP. Consider procurement strategy in order to ensure work load is balanced across the trades and that key packages are split where there is risk of inadequate resource with one Subcontractor. | Brookfield | Stage 1 | 1 | 3 | 3 | Acceptable | Ongoing review of labour resource - no impact at present. Contacts with local employment market continuing to be built upon and maintained. Working well with suppliers. |
| B3 | Calculation of disallowable costs | Project disputes arise and costs increase | Properly manage the supply chain in order to minimise the opportunity for discussion in regard to disallowable costs. | Brookfield | Stage 1 | 1 | 3 | 3 | Acceptable | Managing the supply chain. Carrying out internal audits. First audit complete, report will be circulated. |
| B4 | Change Control and Management of Change protocol by the Contractor through the Supply Chain | Delay to Project and subsequent increase in Defined Cost | Implement Change Control at start of Stage 1 | Brookfield | Stage 1 | 1 | 3 | 3 | Acceptable | Process ongoing and Sypro being used to administer process between Board and BCL. Process working well. |
| B5 | Change in Contractor or Sub-Contractor management personnel | Loss of direction to project. | Ensure suitable management hierarchy in place. | Brookfield | Stage 1 | 1 | 2 | 2 | Acceptable | No issues currently. Onoing review. |
| B6 | Cost escalation given economic climate, prevailing market conditions. Allowance to compensate for movement in component and material costs over and above that which is recoverable against RPI calcs | Increase in Defined costs | Ensure adequate consideration given to risk allowances / procure major works packages early | Brookfield | Stage 1 | 2 | 4 | 8 | Undesirable | Continuing to monitor inflation rate and RPI |
| B7 | Cost of extended warranties e.g. Performance bonds, PCGs etc | Increase in Defined costs | Ensure adequate allowance made within budget at outset. Agree terms with supply chain in advance. Seek to agree key Packages requiring bonds and period of bonds and establish by risk analysis the potential to reduce level of bonds and/or timescale for bonds. Consider other Insurance Products on the Market that may provide more economical solution. Where PCG is available from Subcontractor consider option to provide in lieu of bonds. Commercial Dialogue Meeting no 3 it was confirmed that Contractor Bond expires at Completion of each Stage. | Brookfield | Stage 1 | 0 | 0 | 0 | Acceptable | No current issues. Ongoing monitoring. |
| B8 | Deflation | Presents both opportunity to reduce costs but may have a negative impact on commercial viability of supply chain members. | Brookfield team to ensure supply chain is robust | Brookfield | Stage 1 | 1 | 2 | 2 | Acceptable | Ongoing monitoring. Risk pot being protected. |
| B9 | Delay damages as a result of much tighter programme initiated by the Board | Cost increase | Board confirmed at Commercial meeting No 3 the level of damages: Labs £50k/wk. | Brookfield | Stage 1 | 3 | 4 | 12 | Undesirable | Programme remains on target. Ongoing monitoring of programmes |
| B10 | Design development and scope creep to meet ER's | Increased costs | Ensure effective change control is in place during contract period | Brookfield | Stage 1 | 1 | 3 | 3 | Acceptable | D to E reconcilliation completed. No further scope creep. |
| B11 | Incorrect Level of Pricing in the Contractors tender pricing | Increase in Defined Costs | Benchmarking and market testing of all key elements of Contractor pricing. Peer review and tender settlement meeting. Key Supply Chain input. | Brookfield | Stage 1 | 2 | 4 | 8 | Undesirable | Ongoing review. Overall balancing out. |
| B12 | Infrastructure surrounding Labs impacting on delivery of programme | Cost increase and time delay | To be monitored during construction | Brookfield | Stage 1 | 1 | 3 | 3 | Acceptable | Ongoing monitoring. Potential VIE issue re new Labs Road layout. BCL to provide phasing drawings. |
| B13 | Insolvency of supply chain / suppliers | Increased costs and delay to project | Ensure robust financial checks are undertaken on supply chain prior to appointment and that ownership of materials etc. are managed in accordance with Contract requirements. | Brookfield | Stage 1 | 2 | 4 | 8 | Undesirable | No current issues. Ongoing monitoring of supply chain/suppliers. Internal traiing within team complete, individual identified to review financial information. |
| B14 | Insufficient information to adequately establish defined cost | Cost impact with regard to pain/gain | Robust contract management procedures e.g. change control. Full audits on supply chain | Brookfield | Stage 1 | 1 | 4 | 4 | Acceptable | Ongoing management of supply chain |
| B15 | Insurance excesses not recovered as a consequence of it being a disallowable cost | Cost Increase | Undertake discussions with insurance brokers and supply chain. Subguard. | Brookfield | Stage 1 | 1 | 3 | 3 | Acceptable | No insurance issues to date |
| B16 | Interest rate changes | Costs increase due to inflationary impact | Secure fixed costs for works packages early in procurement process | Brookfield | Stage 1 | 1 | 3 | 3 | Acceptable | Continuous monitoring of inflation |
| B17 | Material off site payments | Failure to transfer title in goods and leads to loss | Ensure correct paperwork and appropriate management procedures are in place. | Brookfield | Stage 1 | 1 | 4 | 4 | Acceptable | In principle paper to be submitted to Board as per B1. |
| B18 | Proper administration of NEC3 contract | Delays to projects, increased costs and damaging to relationships | Set up NEC3 workshops to ensure that it is understood by all and ensure appropriate resources are in place to deliver. | Brookfield | Stage 1 | 1 | 3 | 3 | Acceptable | Administration processes in place. Weekly BCL and NHS joint meeting to discuss EWs,PMIs, CEs. |
| B19 | Scope of packages due to inadequate information | Scope missed and leads to increased costs. Package is too large to manage. | Schedule meeting to list all packages and agree scope and apply standard Brookfield procurement processes. | Brookfield | Stage 1 | 2 | 3 | 6 | Acceptable | Regular package scope meetings in place |
| B20 | Step down agreements with sub-contractors | Supply chain members are unable to meet contractual obligations which leads to project delay | Ensure that terms and conditions are pitched at a level appropriate to the specific package of works. | Brookfield | Stage 1 | 1 | 3 | 3 | Acceptable | Step down arrangements working well. |
| B21 | The impact of incorrect programme and cost estimates for commissioning new building | Increased cost and delay to programme | Commissioning programme and costing to be fully detailed and reviewed. | Brookfield | Stage 1 | 2 | 3 | 6 | Acceptable | Ongoing lookahead. Commissioing groups to be established in due course. Labs Progress Meeting convened, monthly meetings scheduled. |
| B22 | Transparency of tender procurement process and out turn | Loss of trust and negative impact on relationships. Failure to agree contract price delays programme | Operate open book collaborative working throughout supply chain. | Brookfield | Stage 1 | 1 | 3 | 3 | Acceptable | Open book process working well. Ongoing process |
| B23 | Unions and Industrial Relations with regard to construction | Poor relationships could lead to delays in the project and increased costs | Ensure full dialogue and engage with Unions at an early stage. Ensure Community Engagement strategy includes Union/Industrial relations | Brookfield | Stage 1 | 1 | 2 | 2 | Acceptable | No issues thus far. |
| B24 | Area increase to Labs from OBC | Cost increase and time delay | Implement Change Control at start of Stage 1 | Brookfield | Stage 1 | 2 | 2 | 4 | Acceptable | To be closed off as part of Stage D to E reconcilliation |
| B25 | Change Control and Management of Change protocol by the Board | Uncontrolled change leads to increased costs delays to programme. | Implement Change Control at start of Stage 1. Change by Board will be a Compensation Event | Brookfield | Stage 1 | 0 | 0 | 0 | Acceptable | Protocol being operated. Ongoing weekly review of EWs, PMIs and CEs |
| B26 | Cost of discharging planning conditions | Cost increase | Early assessment of planning conditions once received | Brookfield | Stage 1 | 1 | 3 | 3 | Acceptable | Agreed at Commercial Group. |
| C1 | Compliance with CAA Regulations during construction | Impact on helicopter and existing aircraft operations which affect hospital function. | Close liaison with the facilities management team during construction works | Brookfield | Stage 1 | 1 | 2 | 2 | Acceptable | Helicopter Management Plan fully signed off by all stakeholders. Regular review of HMP |
| C2 | Construction noise | Stoppages resulting in increased costs. Methods of working result in increased costs e.g. water bursting methods | Examine construction operational procedures and implement appropriate liaison measures. | Brookfield | Stage 1 | 1 | 3 | 3 | Acceptable | Ongoing local community engagement and liaison. Noise Plan in force. |
| C3 | Damage to existing / 3rd party buildings due to carrying out of the works e.g. subsidence, heave, vibrations etc. | Damage to property, injury, loss of life all resulting in delays to project and increased costs | Review construction methods, ensure adequate protection in place prior to commencement of works and all method statements approved. | Brookfield | Stage 1 | 1 | 2 | 2 | Acceptable | Undertaken dilapidation studies prior to commencing works to allow measurements to be taken. Ongoing visual review |
| C4 | Ground floor slab construction sequencing | Increased costs and programme | Detailed installation plans and methodology to be developed. Costs included in Cost Plan | Brookfield | Stage 1 | 1 | 3 | 3 | Acceptable | Working in accordance to current programme |
| C5 | Delays to procurement of materials | Delays to project and increased costs | Ensure supply chain adequate to suit size of project and that materials are sourced from a competent source. | Brookfield | Stage 1 | 1 | 4 | 4 | Acceptable | Continuing to monitor supply chain and work with supply chain to ensure no delays |
| C6 | De-watering | Impact on construction works, delays progress and increased costs | Ensure adequate de-watering system in place | Brookfield | Stage 1 | 2 | 3 | 6 | Acceptable | Dewatering system currently in place is working well. To be closed |
| C7 | Disposal of excavated material | Unable to locate local tip leads to increased costs | Tip sourced through supply chain | Brookfield | Stage 1 | 1 | 1 | 1 | Acceptable | Ongoing, site waste management plan in place. |
| C8 | Disposal of waste | Unable to identify suitable local tip leads to increased costs. Impact on BREEAM rating for failure to classify correctly | Implement waste segregation and implement schemes e.g. SWMP in accordance with current legislation. | Brookfield | Stage 1 | 1 | 3 | 3 | Acceptable | SWMP in place. Ongoing process. Identified opportunity for SME. |
| C9 | Failure by Contractor to co-ordinate M&E Installations | Project delays and increased costs | Continue early involvement of M&E supply chain, ensure robust programme management and use of 3D modelling. Consider/implement use of off-site pre-fabrication process. | Brookfield | Stage 1 | 1 | 2 | 2 | Acceptable | Early involvement of M&E supply chain. Working with the design team |
| C10 | Failure by Contractor to co-ordinate of M&E services with the building structure | Spatial requirements are inadequate to meet needs of service installations leading to failure of delivery of project | Ensure spatial requirements are agreed and determined early in the programme. | Brookfield | Stage 1 | 2 | 4 | 8 | Undesirable | Good early co-ordination already taken place |
| C11 | Failure to maintain adequate on site security (Project) | Theft, vandalism, fire etc resulting in delays and increased costs | Employ suitable on site security from start of project | Brookfield | Stage 1 | 1 | 3 | 3 | Acceptable | Acceptable security company employed on site with no issues to date. |
| C12 | Inadequacy of O&M Manuals | Complexity in compiling and use | Understanding clients requirements e.g. electronic system and agree appropriate format and content. | Brookfield | Stage 1 | 1 | 4 | 4 | Acceptable | Process put in place to capture all information |
| C13 | Delays due to inclement weather | Additional cost and programme delays | Include allowances for minimal delays in target cost | Brookfield | Stage 1 | 2 | 4 | 8 | Undesirable | High winds continues to be a risk re potential for cranage downtime. |
| C14 | Interfaces between external wall and structure | Lack of air tightness and weather permeability and thus non compliance with Section 6 of Building Regs | Quality control during construction | Brookfield | Stage 1 | 1 | 2 | 2 | Acceptable | Ongoing and will be a focus further down the line |
| C15 | Lack of quality control | Delays to project handover, failure to achieve requisite level | Implement on-site quality control measures and ensure employment of dedicated QA personnel. | Brookfield | Stage 1 | 1 | 2 | 2 | Acceptable | Current quality control measures satisfactory |
| C16 | Proximity of welfare facilities | Reduction in productivity leading to increased costs and time delays | Through logistics plan developed; implement flexible working arrangements to allow coordinated lunch and tea breaks in accordance with Union regulations. | Brookfield | Stage 1 | 1 | 1 | 1 | Acceptable | Onsite canteen replaced. Ongoing liaison with contractors/operatives. Notice Board erected for use by supply chain to allow information sharing between BCL and operatives |
| C17 | Quality of sub-contractors to service large work packages | Delays to the project | Ensure supply chain management procedures are followed; split packages where appropriate | Brookfield | Stage 1 | 1 | 4 | 4 | Acceptable | Working well. 64 packages identified for Labs Project |
| C18 | Site safety (CDM etc.) | Death or injury to persons and damage to property resulting in increased costs, delays to the project, insurance claims and legal proceedings etc. | Robust Health & Safety plans, site inductions for all personnel, tool box talks, PPE, method statements, risk statements, hot works permits etc. Appropriate H&S qualifications e.g. CSCS cards. | Brookfield | Stage 1 | 1 | 5 | 5 | Acceptable | Health an Safety record very good. AK will provide a presentation to Board's H&S Manager at next PSG. |
| C19 | The discovery of latent defects in new building after handover | Disruption to operational use of building and increases client management costs. Damage to public perception | Robust quality control measures, building commissioning procedures and appointment of experienced supervisor all led by good design detailing and specifications. | Brookfield | Stage 1 | 1 | 5 | 5 | Acceptable | Not at this stage |
| C20 | Roosting nesting season/Bat surveys | Delays to programme if timing not appropriate | RFI 146 refers. NHSGG&C to undertake bat survey Sept 2009 and results will be passed to bidder on contract award. None anticipated | Brookfield | Stage 1 | 1 | 1 | 1 | Acceptable | Closed off. Bat Survey confirmed no bats on site |

| Risk | | | Response | | | Residual Assessment | | | | Comments |
|---|---|---|---|---|---|---|---|---|---|---|
| **Item** | **Description** | **Risk Effect** | **Risk control measure or action taken to mitigate** | **Action Owner** | **When** | **P 1-5** | **I 1-5** | **PI Score** | **Strategy** | |
| C21 | Attendance and/or information relating to group 2-4 equipment | Failure to agree who provides what level of attendance impacts installation resulting in delays to the project and increased costs | Early agreement of attendances required | Brookfield | Stage 1 | 2 | 4 | 8 | Undesirable | Equipment list being finalised, Version 5 circulated. |
| C22 | Discovery of unexploded ordinance | Health & Safety implications, time delays and cost increases. Potential impact on existing facilities. | Consideration of probes prior to piling | Brookfield | Stage 1 | 1 | 2 | 2 | Acceptable | Closed off. Piling works completed |
| C23 | Restrictions on oversailing of existing buildings influences construction methods e.g. tower cranes | Increases costs and delays to programme due to possible restricted methods of workings | No oversailing included in logistics | Brookfield | Stage 1 | 1 | 1 | 1 | Acceptable | Closed off. No issues |
| C24 | Damage to works by Employer or any of its Third Party Consultants and Contractors | Cost/Delay | Attendance and management of direct contracts during construction | Brookfield | Stage 1 | 1 | 3 | 3 | Acceptable | No issues so far. Monitoring ongoing |
| C25 | Dilapidation surveys | Disputes over status of existing facilities prior to works commencing | Ensure full joint survey undertaken and agreed with the Client. | Brookfield | Stage 1 | 1 | 1 | 1 | Acceptable | Closed off - Dilapidation Surveys completed |
| C26 | Energy centre - link to retained estate | Interruption to existing facilities | Consider stand-by power generation or review ability to design and construct as part of Stage 1 Works. | Brookfield | Stage 1 | 1 | 4 | 4 | Acceptable | PICKED UP ELSEWHERE |
| C27 | Delays to piling due to obstructions | Additional cost and programme delays | Allow suitable risk allowance based on latest site investigation carried out during Stage 2; Review passing risk to contractor | Brookfield | Stage 3 | 2 | 3 | 6 | Acceptable | Closed off. Piling works completed |
| D1 | Additional Cost of Specialist consultants | Increased Cost | Brookfield management process to be implemented | Brookfield | Stage 1 | 0 | 0 | 0 | Acceptable | Ongoing |
| D2 | Air Tightness | Loss of BREEAM points, impair building operation and performance | Ensure protocols are in place to manage the construction and testing. | Brookfield | Stage 1 | 2 | 3 | 6 | Acceptable | Protocols to be implemented in due course - not at that stage in process |
| D3 | Polyurethane finish to floor and ceilings to mortuary areas - noted as required at last labs dialogue meeting but not included on room data sheets | Additional cost | Determine requirements early during Stage 1 | Brookfield | Stage 1 | 1 | 3 | 3 | Acceptable | Closed off . Part of Stage D to E reconcilliation works |
| D4 | Drainage Discharge consent not achieved | Increased costs, time delay and site functions and operations | Early identification and an understanding of the requirements. Scottish Water | Brookfield | Stage 1 | 2 | 4 | 8 | Undesirable | Nearing completion. Only drainage to be finalised |
| D5 | External detailing of building below expected quality | Client brief not met, delays to building handover, costs increase. | Implement appropriate quality control measures during construction | Brookfield | Stage 1 | 1 | 3 | 3 | Acceptable | Ongoing - Part of the GCC Planning process. |
| D6 | General design quality by Contractor | Client brief not met, delays to building handover, costs increase. | Implement appropriate quality control measures during construction | Brookfield | Stage 1 | 1 | 3 | 3 | Acceptable | Ongoing |
| D7 | Inadequacy of emergency generator provisions | Disruption to hospital services including existing buildings | Identify requirements, liaise with Client's external consultants and include within design. | Brookfield | Stage 1 | 2 | 3 | 6 | Acceptable | No issues so far. Ongoing review |
| D8 | Inadequate Coordination of design due to short pre-construction period | Increased costs and programme delays | Ensure design fully coordinated and reviewed prior to works packages commencing on site | Brookfield | Stage 1 | 2 | 4 | 8 | Undesirable | Ongoing monitoring |
| D9 | Late design information from sub-contractors and designers due to short pre-construction period leading to inadequate procurement times and delays or acceleration | Time delays and cost increases | Ensure good programme management and early appointment of supply chain. | Brookfield | Stage 1 | 3 | 5 | 15 | Unacceptable | Closed off. Completed |
| D10 | Poor Design development and management | Uncontrolled change leads to increased costs delays to programme. | Implement Change Control at start of Stage 1 | Brookfield | Stage 1 | 1 | 2 | 2 | Acceptable | Closed off. Completed |
| D11 | Poorly considered innovative design / materials solutions | Lack of knowledge results in poor construction leading to building failure resulting in increased costs and delay. | Ensure all solutions are fully explored | Brookfield | Stage 1 | 1 | 2 | 2 | Acceptable | Closed off. Completed |
| D12 | Increase to agreed schedule of accommodation: Rooms, circulation, plant rooms, other | Increased costs and time delays | Implement Change Control at start of Stage 1 | Brookfield | Stage 1 | 1 | 2 | 2 | Acceptable | Close off. Completed. |
| D13 | No Group Equipment schedule issued for labs -schedule taken from room data sheets | Increased costs and time delays | Early agreement with novated design team and NSGH Board | Brookfield | Stage 1 | 2 | 4 | 8 | Undesirable | Closed off |
| D14 | External wall service zone strategy requirements unclear from design information issued | Increased costs and time delays | Early agreement of requirements with novated design team | Brookfield | Stage 1 | 2 | 4 | 8 | Undesirable | Closed off |
| D15 | Requirement for vulcathene pipework confirmed at final labs dialogue meeting - URS drawings and design indicate polypropylene | Increased costs and time delays | Early agreement of requirements with novated design team | Brookfield | Stage 1 | 2 | 4 | 8 | Undesirable | Close off. Part of Stage D to E reconcilliation process. |
| D16 | Partition types are noted but no indication of where these are located is included on the drawings or room data sheets | Increased costs and time delays | Early agreement of requirements with novated design team | Brookfield | Stage 1 | 2 | 4 | 8 | Undesirable | Closed off |
| D17 | Brise soleil requirements unclear from drawings | Increased costs and time delays | Early agreement of requirements with novated design team | Brookfield | Stage 1 | 2 | 4 | 8 | Undesirable | Closed off |
| D18 | Interface detailing to external walls - a large number of different cladding types | Increased costs and time delays | Managing of interfaces and package contractors during construction | Brookfield | Stage 1 | 3 | 3 | 9 | Undesirable | Closed off |
| D19 | Implementation of Euro codes and changes to Building Regulations | Increased cost and time | To be considered by Brookfield | Brookfield | Stage 1 | 1 | 2 | 2 | Acceptable | Closed off. Part of Planning |
| D20 | Novated design team fees - adequacy | Cost increase | Review design and scope with novated design team | Brookfield | Stage 1 | 3 | 3 | 9 | Undesirable | Closed - Submitted Building Warrant |
| E1 | Achieving BREEAM Excellent | Increased costs. Failure to meet rating leads to bid rejection | Novated design team to liaise with Brookfield's appointed BREEAM consultant to confirm requirements. BREEAM consultant to carry out BREEAM assessment of design. | Brookfield | Stage 1 | 2 | 4 | 8 | Undesirable | Interim Report 'Very Good' prior to commencement of Energy Centre where 'Excellent' to be achieved. Onoing monitoring. |
| O1 | Delay/Consultation caused by Local Resident's Groups | Opportunity to promote project, Client and Contractor | Brookfield to implement Project Administration Manual, Corporate Social Responsibility Policies e.g. Neighbour notification schemes and appoint liaison manager. | Brookfield | Stage 1 | 1 | 1 | 1 | Acceptable | Neighbourhood notification process going well. Liaison meeting held, no objections raised. Regular communication distributed, Elder Park Communication Centre established, newsletters planned. |
| O2 | Delivery of materials causes disruption to others | Disruption to emergency vehicles, services, patients, visitors, staff. Potential H&S impact. Delays to material deliveries. Potential contamination from construction traffic. Delays to delivery could result in programme delays and increased costs | Implement logistics plan, traffic management plan and engage with Local Authority and Police on best methods. Introduce wheel wash and road cleaning operations. Implement material delivery control e.g. consider "just in time" material delivery. | Brookfield | Stage 1 | 1 | 5 | 5 | Acceptable | Going well |
| O3 | Distribution of materials on-site | Delays to construction, increased labour costs, loss, wastage and damage to materials, all resulting in increased costs. | Consider method of materials handling, storage and distribution in order to reduce wastage, time loss and labour costs, considered within logistics plan. | Brookfield | Stage 1 | 1 | 1 | 1 | Acceptable | Going well |
| O4 | Failure to control dust (Aspergillus) | Patient, staff and public health care affected. Damage to property and damage to public perception. | Implement appropriate control measures e.g. dust suppression, water spraying, wheel washing etc. Managed use of abrasive wheel cutting tools and consider appropriate control e.g. Tents, all as detailed in the logistics plan. | Brookfield | Stage 1 | 1 | 5 | 5 | Acceptable | No issues so far. Continuing to monitor |
| O5 | Obtaining permit to discharge certificate and ramifications thereof | Additional costs and programme | Enter early dialogue with Scottish Water to obatain permit | Brookfield | Stage 1 | 2 | 4 | 8 | Undesirable | Ongoing. Previous issue with SEPA managed. |
| O6 | Highways: Peak periods for access and egress | Disruption to emergency vehicles, services, patients, visitors, staff. Potential H&S impact. Delays to material deliveries. Potential contamination from construction traffic. | Implement traffic management plan, engage with Local Authority and Police on best methods. Introduce wheel wash and road cleaning operations, all as detailed in the logistics plan.. | Brookfield | Stage 1 | 1 | 3 | 3 | Acceptable | In progress - working well |
| O7 | Management / Provision of site facilities | Poor quality facilities may have an impact on productivity, conversely, good quality facilities helps to attract and retain good quality staff | Brookfield to give careful consideration to planning facilities and requirements and liaison with client on their requirements, all as detailed in the logistics plan. | Brookfield | Stage 1 | 1 | 1 | 1 | Acceptable | No issues thus far - continuing to monitor |
| O8 | Off-site parking for construction staff | Further congestion to surrounding area. Increased costs in provision of parking and worker transfer costs | Brookfield to consider renting suitable local premises, all as detailed in the logistics plan. | Brookfield | Stage 1 | 2 | 3 | 6 | Acceptable | BCL finalising proposals for off-site parking. |
| O9 | Delays caused by protester action groups | Delay to project resulting in increased costs | Develop protocols in conjunction with Police, on-site security and Client's security team. | Brookfield | Stage 1 | 1 | 3 | 3 | Acceptable | No issues thus far. Continuing to monitor |
| P1 | The impact of incorrect program and duration by Contractor | Increased costs and delay to project | Brookfield to assess and provide a programme that is able to meet the overall requirements and achieve the Key Dates. | Brookfield | Stage 1 | 1 | 3 | 3 | Acceptable | Programme remains on target. Ongoing monitoring of programme |
| O11 | Compliance with WRAP | Increased costs | Understanding the WRAP requirements, evidencing what we are currently providing, providing a strategy and implementation thereof. | Brookfield | Stage 1 | 1 | 1 | 1 | Acceptable | Ongoing |
| O12 | Payment of £750k Bond in relation to Section 75 works | Mechanisms of implementation of bond (who benefits?) | Include costs in tender submission | Brookfield | Stage 1 | 1 | 1 | 1 | Acceptable | Closed off |

| | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| 1 | Completeness of design from Novated design team for Laboratories and FM building- scope of services, programme and fees | Delay to Project and subsequent increase in Defined Cost | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | 0 | 0 | 0 | Acceptable | |
| 2 | Any other changes in VAT | Cost increase or decrease | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | 0 | 0 | 0 | Acceptable | |

| 4 | Funding availability and cash flow | Additional cost to contractor and possible interest charges | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 5 | Land acquisition(s) for master plan of campus | Failure to acquire on time delays project and will result in re-design | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 6 | Late payments by the Employer | Increased costs in interest charges | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 7 | The impact of "Compensation Events" to the Contractor (variations) | Delays to project and increased costs (beyond those recoverable through CE) | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 8 | The impact of incorrect programme and cost estimates for decanting from existing premises | Delays commissioning and operation of new facility | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 9 | The non realisation of VAT reclaim and the introduction of new Statutory costs | Cost increase or decrease | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 10 | Inflation above the allowance in the contract | Increased cost | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 11 | The introduction and incorporation of changes to Scottish Government Health Department new requirements | Included on NSGH Board Risk Register | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 12 | Potential for impact of legislative or regulatory change, e.g. 1. Green issues 2. Environmental Planning standards | Included on NSGH Board Risk Register | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 13 | Equipment (Group 1 & 2) varies from the information in the ITPD | Included on NSGH Board Risk Register | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 14 | Failure to achieve approvals at key dates and gateways. FBC approval | Delay to project and increased costs | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 15 | Discovery of mine workings | Delay to project and increased costs for grouting etc. | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 16 | Discovery of underground stream / spring | Time delays and cost increases | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 17 | Any unforeseen ground/site conditions under the footprint of existing facilities | Cost increase and delay to project | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 18 | Asbestos | Health & Safety implications. Delays to the site clearance and demolition works and increased costs | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 19 | Asbestos in culvert | Health & Safety implications. Delays to the site clearance and demolition works and increased costs | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 20 | Discovery of existing basements | Delay to project and increased costs. Possible re-design | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 21 | Discovery of existing underground steam mains | Delays to project while dismantled and re-routed resulting in increased costs. Impact on programme e.g. works have to be undertaken during summer months | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 22 | Discovery of Japanese Knotweed | Contamination of other areas within hospital campus. Increased costs and delay to project. | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 23 | Discovery of unknown major services | Cost impact to divert and delay on programme | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 24 | Relocation of orange aerial tower to accommodate land purchase | Included on NSGH Board Risk Register | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 25 | The Board do not provide a contract programme for the 33kV sub-station by the required date which is when the board approve the stages 1, 2, 3 & 3a | Included on NSGH Board Risk Register | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 26 | Any unexpected changes in medical technology | Increased costs, delay to project and impaired functional performance | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 27 | Impact of pre-construction demolition works on design | Failure to implement early site clearance will delay site surveys and affect final design completion. | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 28 | Impact of change in Employers Requirements (space and design standards) | Included on NSGH Board Risk Register | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 29 | Planning authority don't comply with statutory response times when in receipt of correctly completed Application | Included on NSGH Board Risk Register | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 30 | Additional requirements for Police counter terrorism | Included on NSGH Board Risk Register | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 31 | Unforeseen additional Equipment requirements | Included on NSGH Board Risk Register | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 32 | Car Parking strategy changes | Included on NSGH Board Risk Register | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 33 | Level of information provided about ICT requirements | Included on NSGH Board Risk Register | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 34 | Lifts Strategy (Lab) | Included on NSGH Board Risk Register | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 35 | The requirements of site wide engineering strategy change | Included on NSGH Board Risk Register | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 36 | An increased demand for patient services from that agreed | Included on NSGH Board Risk Register | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 37 | The non realisation of existing equipment transfers into new facilities | Increased costs and delay to project as a result of Compensation Event | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 38 | Operation of Helipad during lab construction disrupting works | Included on NSGH Board Risk Register | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 39 | Interaction of construction with day to day operation of existing hospital and interface with facilities managers | Patient care affected. Health & Safety implications. Public perception damaged | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 40 | Archaeology - Impact due to find | Delay to project and increased costs as a result of Compensation Event | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 41 | Impact of delay in contractor gaining access to the site or availability of areas | Increased costs and delay to project | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 42 | Approval process / sign off of equipment plans & RDS if Board don't comply with agreed timescales | Included on NSGH Board Risk Register | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 43 | Potential for delayed completion of enabling works by others, eg: 1. Site clearance 2. Car Parks 3. Substation | Included on NSGH Board Risk Register | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 44 | Inability to secure Planning approval: Labs/FM facility | Delay to project and increased costs | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| 45 | Section 75 Agreements and conclusion thereof | Delay to project and increased costs | Included on NSGH Board Risk Register | NHS GGC | Stage 1 | **0** | **0** | **0** | Acceptable | |
| | | | | | | | | | | |

| D7 | Design | Design development generally | De d ig r u m t e t itio al t base design is at Stage C/D | **4** | **4** | **16** | Unacceptable | Implement Change Control from start of Stage 2 | Brookfiel | Stage 2 | Ongoing |

**Brookfield Risk Register** **Stage 3 - Design & Construction New Hospitals** **Date last reviewed: 14th September 2010**

Brookfield

| Risk | | | | Inherent Assessment | | | | Response | |
|---|---|---|---|---|---|---|---|---|---|
| Item | Category | Description | Risk Effect | P 1-5 | I 1-5 | PI Score | Strategy | Risk control measure or action taken to mitigate | Comments |
| B1 | Business | Availability of suitable labour resource and impact on procurement of various packages | Delay to the project and increased costs. | 3 | 3 | 9 | Undesirable | Ensure that labour resources are planned for through use of labour resource histograms etc. Ensure good relationships with DWP. Consider procurement strategy in orde to ensure work load is balanced across the trades and that key packages are split where there is risk of inadequate resource with one Subcontractor. | On-going discussion No labour resource issues anticipated. BCL to identify the need for highly skilled commissioning personnel for hospitals |
| B2 | Business | Calculation of disallowable costs | Project disputes arise and costs increase | 3 | 4 | 12 | Undesirable | Properly manage the supply chain in order to minimise the opportunity for discussion in regard to disallowable costs. | Ongoing identification of work packages |
| B3 | Business | Change Control and Management of Change protocol by the Contractor through the Supply Chain | Delay to Project and subsequent increase in Defined Cost | 2 | 4 | 8 | Undesirable | Implement Change Control from start of Stage 3 | Change Control Process in place |
| B4 | Business | Change in Contractor or Sub-Contractor management personnel | Loss of direction to project. | 2 | 3 | 6 | Acceptable | Ensure suitable management hierarchy in place. | Ongoing review |
| B5 | Business | Cost escalation given economic climate, prevailing market conditions | Increase in Defined costs | 3 | 4 | 12 | Undesirable | Agree target costs with key supply chain members at end of Stage 2 to mitigate cost increases (85% of works package value let at end of Stage 2) | Continual monitoring of tender price and inflation.<br>Checks undertaken on key supply chain partners |
| B6 | Business | Cost of extended warranties e.g. Performance bonds, PCGs etc | Increase in Defined costs | 1 | 4 | 4 | Acceptable | Include in target cost at end of Stage 2 | Checks undertaken on key supply chain partners. Extended warranties being monitored. |
| B7 | Business | Deflation | Presents both opportunity to reduce costs but may have a negative impact on commercial viability of supply chain members. | 2 | 3 | 6 | Acceptable | Brookfield team to make appropriate assessment. | Continual monitoring. |
| B8 | Business | Delay damages due to tighter programme completion date | Cost increase | 2 | 5 | 10 | Undesirable | To be considered. Board confirmed at Commercial meeting No 3 the level of damages: Adult & Children's £62,500 per week (weeks 1 to 4), £125,000 (weeks 5 to 8), £187,500 (weeks 9 to 12), £250,000 week thereafter | Programme under review. Acceleration discussions will commence when/if necessary as programme prepared at bid stage |
| B9 | Business | Design development and scope creep | Increased costs | 3 | 4 | 12 | Undesirable | Undertake value management and value engineering exercises during preconstruction period. Ensure effective change control is in place during pre-contract period and ensure through dialogue meetings that risk is identified and mitigated by immediate action. | Monitoring through 1:200 and 1:50 process. Process going well. |
| B10 | Business | Incorrect Cost estimates for Adult & Children's' planning approval | Increase in planning fees | 1 | 3 | 3 | Acceptable | Include in target cost at end of Stage 2 | Planning fee discussions concluded |
| B11 | Business | Incorrect insurance rates included in tender | Increase costs | 1 | 3 | 3 | Acceptable | To be considered. | Ongoing review. Overall balancing out so far. |
| B12 | Business | Incorrect Level of Pricing in the Contractors tender pricing | Increase in Defined Costs | 3 | 5 | | Unacceptable | Agree target costs with key supply chain members at end of Stage 2 to mitigate cost increases (85% of works package value let at end of Stage 2) | BCL confident with cost plan. Ongoing monitoring |
| B13 | Business | Insolvency of supply chain / suppliers | Increased costs and delay to project | 3 | 4 | 12 | Undesirable | Ensure robust financial checks are undertaken on supply chain prior to appointment and that ownership of materials etc. are managed in accordance with Contract requirements. | Continuing to monitor and do checks on the supply chain.<br>Continuing to break down the packages into manageable contracts |
| B14 | Business | Insufficient information to adequately establish defined cost | Cost impact with regard to pain/gain | 2 | 4 | 8 | Undesirable | Robust contract management procedures e.g. change control. | Change Control Process in place. Ongoing review of costs. |
| B15 | Business | Insurance excesses not recovered as a consequence of it being a disallowable cost | Cost Increase | 1 | 4 | 4 | Acceptable | Undertake discussions with insurance brokers and supply chain. Subguard. | No issues presently |
| B16 | Business | Interest rate changes | Costs increase due to inflationary impact | 2 | 4 | 8 | Undesirable | Allowance included in Target Cost | Ongoing monitoring |
| B17 | Business | Material off site payments | Failure to transfer title in goods and leads to loss | 2 | 5 | 10 | Undesirable | Ensure correct paperwork and appropriate management procedures are in place. | Paper being prepared re off-site working. Ongoing |
| B18 | Business | Priced activity schedule | Failure to complete activities on time impacts payment | 2 | 5 | 10 | Undesirable | Discuss amending payment provision with NHS GGC. Monthly Valuations with 4 week payment cycles confirmed at Commercial Dialogue meeting | Activity schedule updated on a monthly basis |
| B19 | Business | Proper administration of NEC3 contract | Delays to projects, increased costs and damaging to relationships | 2 | 4 | 8 | Undesirable | Set up NEC3 workshops to ensure that it is understood by all and ensure appropriate resources are in place to deliver. | Ongoing management of NEC3 Process. Regular Early Warning meetings to discuss changes to contract. |
| B20 | Business | Scope of packages not appreciated at time of establishing Target Price due to speed of tender and design information available | Scope missed and leads to increased costs. Package is too large to manage. | 3 | 5 | 15 | Unacceptable | Agree target costs with key supply chain members at end of Stage 2 to mitigate cost increases (85% of works package value let at end of Stage 2) | Packages are being broken down and reviewed. Information on packages being pulled together. |
| B21 | Business | Step down agreements with sub-contractors | Supply chain members are unable to meet contractual obligations which leads to project delay | 2 | 4 | 8 | Undesirable | Ensure that terms and conditions are pitched at a level appropriate to the specific package of works at Stage 2 | Appropriate step-down arrangements being undertaken |
| B22 | Business | The impact of incorrect programme and cost estimates for commissioning new building | Increased cost and delay to programme | 2 | 5 | 10 | Undesirable | Commissioning programme and costing to be fully detailed and reviewed. | Will establish Adult and Children's Hospitals Commissioning Group in due course. |
| B23 | Business | Transparency of tender procurement process and out turn | Loss of trust and negative impact on relationships. Failure to agree contract price delays programme | 2 | 4 | 8 | Undesirable | Operate open book collaborative working throughout supply chain. | Current process working satisfactory and will continue throughout the Adult & Children's project |
| B24 | Business | Unions and Industrial Relations with regard to construction | Poor relationships could lead to delays in the project and increased costs | 2 | 4 | 8 | Undesirable | Ensure full dialogue and engage with Unions at an early stage. Ensure Community Engagement strategy includes Union/Industrial relations | Ongoing engagement |
| B25 | Business | Change Control and Management of Change protocol by the Board | Uncontrolled change leads to increased costs delays to programme. | 3 | 4 | 12 | Undesirable | Implement Change Control from start of Stage 3 | Change Control Process implemented and actively managed. Regular Early Warning meetings in place to discuss changes |
| B26 | Business | Dispute Resolution | Delays to projects, increased costs and damaging to relationships | 3 | 5 | 15 | Unacceptable | Agree tiered dispute resolution process and engender good team working relationships as promoted by NEC3. Consider introduction of informal "high level" director involvement in process before matter goes to formal dispute resolution mechanism. | No issues currently |
| C1 | Construction | Physical site conditions don't reflect site investigation | Time delay and cost increase | 3 | 4 | 12 | Undesirable | Appropriate risk to be calculated | Further SIs undertaken. Report received in September 2010. Report appendices awaited by Board team. |
| C2 | Construction | Compliance with CAA Regulations during construction | Impact on helicopter and existing aircraft operations which affect hospital function. | 2 | 5 | 10 | Undesirable | Timely decision required on location of heli pad and temporary relocation of helicopter facilities. | Ongoing review. Helicopter Management Plan agreed by all stakeholders and under regular review. |
| C3 | Construction | Construction noise | Stoppages resulting in increased costs. Methods of working result in increased costs e.g. water bursting methods | 3 | 3 | 9 | Undesirable | Examine construction operational procedures and implement appropriate liaison measures. | Neighbourhood liaison has commenced and will continue |
| C4 | Construction | Damage to existing / 3rd party buildings due to carrying out of the works e.g. subsidence, heave, vibrations etc. | Damage to property, injury, loss of life all resulting in delays to project and increased costs | 2 | 5 | 10 | Undesirable | Review construction methods, ensure adequate protection in place prior to commencement of works and all method statements approved. | Commenced condition surveys in the areas surrounding the Adult & children's Construction site. Stage 3 area surveys commenced. |
| C5 | Construction | Delays to procurement of materials | Delays to project and increased costs | 3 | 4 | 12 | Undesirable | Ensure supply chain adequate to suit size of project and that materials are sourced from a competent source. | Currently no delays and none anticipated. |
| C6 | Construction | Delays due to inclement weather | Additional cost and programme delays | 3 | 4 | 12 | Undesirable | Include allowances for minimal delays in target cost | No issues.<br>Monitoring ongoing.<br>Lessons learned from Labs Project |
| C7 | Construction | De-watering | Impact on construction works, delays progress and increased costs | 3 | 3 | 9 | Undesirable | Ensure adequate de-watering system in place and that desk top study and/or boreholes are taken to establish level of water table. | No issues.<br>Monitoring ongoing.<br>Lessons learned from Labs Project |
| C8 | Construction | Discovery of unforeseen ground conditions | Time delays and cost increases | 2 | 4 | 8 | Undesirable | Undertake detailed site surveys and site investigations etc. | No issues.<br>Monitoring ongoing.<br>Lessons learned from Labs Project |
| C9 | Construction | Disposal of excavated material | Unable to locate local tip leads to increased costs | 2 | 4 | 8 | Undesirable | Tip sourced through supply chain | No issues.<br>Monitoring ongoing.<br>Lessons learned from Labs Project |
| C10 | Construction | Disposal of waste | Unable to identify suitable local tip leads to increased costs. Impact on BREEAM rating for failure to classify correctly | 2 | 4 | 8 | Undesirable | Implement waste segregation and implement schemes e.g. SWMP in accordance with current legislation. | No issues.<br>Monitoring ongoing.<br>Lessons learned from Labs Project<br>BCL will liaise with WRAP |
| C11 | Construction | Diversion of the existing culvert | Delays to the project and increased costs | 2 | 4 | 8 | Undesirable | Establish location and agree route for diversion. | No issues.<br>Monitoring ongoing.<br>Lessons learned from Labs Project |
| C12 | Construction | Failure by Contractor to co-ordinate M&E Installations | Project delays and increased costs | 2 | 4 | 8 | Undesirable | M&E works package contractor to be responsible for M&E design | M&E works package working well |
| C13 | Construction | Ground floor slab construction sequencing | Increased costs and programme | 2 | 4 | 8 | Undesirable | Detailed installation plans and methodology to be developed. Cost now included in Cost Plan | Programme set-up accordingly |
| C14 | Construction | Failure by Contractor to co-ordinate of M&E services with the building structure | Spatial requirements are inadequate to meet needs of service installations leading to failure of delivery of project | 3 | 4 | 12 | Undesirable | Ensure spatial requirements are agreed and determined early in the programme. | M&E services being co-ordinated |
| C15 | Construction | Failure to maintain adequate on site security (Project) | Theft, vandalism, fire etc resulting in delays and increased costs | 2 | 4 | 8 | Undesirable | Logistics team to advise on best set-up and engage in consultation with local Police. | Will be expanded as and when necessary |
| C16 | Construction | Inadequacy of O&M Manuals | Complexity in compiling and use | 2 | 4 | 8 | Undesirable | Understanding clients requirements e.g. electronic system and agree appropriate format and content. | O&M Manuals will be generated from the start of the Adult and Children's Hospitals Project |
| C17 | Construction | Interfaces between external wall and structure | Lack of air tightness and weather permeability and thus non compliance with Section 6 of Building Regs | 3 | 4 | 12 | Undesirable | Quality control during construction | QA procedures will be implemented |
| C18 | Construction | Lack of quality control | Delays to project handover, failure to achieve requisite level | 2 | 4 | 8 | Undesirable | Implement on-site quality control measures and ensure employment of dedicated QA personnel. | QA procedures will be implemented |
| C19 | Construction | Quality of sub-contractors to service large work packages | Delays to the project | 3 | 4 | 12 | Undesirable | Agree target costs with key supply chain members at end of Stage 2 to mitigate cost increases (85% of works package value let at end of Stage 2) | Work packages broken down into manageable packages |
| C20 | Construction | Site safety (CDM etc.) | Death or injury to persons and damage to property resulting in increased costs, delays to the project, insurance claims and legal proceedings etc. | 1 | 5 | 5 | Acceptable | Robust Health & Safety plans, site inductions for all personnel, tool box talks, PPE, method statements, risk statements, hot works permits etc. Appropriate H&S qualifications e.g. CSCS cards. | Health & Safety Plan in place. Lessons learned from Labs Project carried across to Adult & Children's Project |
| C21 | Construction | The discovery of latent defects in new building after handover | Disruption to operational use of building and increases client management costs. Damage to public perception | 2 | 5 | 10 | Undesirable | Robust quality control measures, building commissioning procedures and appointment of experienced supervisor all led by good design detailing and specifications. | BCL do not anticipate any latent defects in the new building |
| C22 | Construction | Waterproofing of basement | Leaking basements affecting function and operation. | 3 | 4 | 12 | Undesirable | Appropriate quality control during construction works | Ongoing works and lessons learned from Labs Project will be carried across to Adult and Childre's Hospital project |

**Brookfield Risk Register** **Stage 3 - Design & Construction New Hospitals** **Date last reviewed: 14th September 2010**

Brookfield

| Risk | | | | Inherent Assessment | | | | Response | |
|---|---|---|---|---|---|---|---|---|---|
| Item | Category | Description | Risk Effect | P 1-5 | I 1-5 | PI Score | Strategy | Risk control measure or action taken to mitigate | Comments |
| C23 | Construction | Discovery of unexploded ordinance | Health & Safety implications, time delays and cost increases. Potential impact on existing facilities. | 2 | 5 | 10 | Undesirable | Probing in advance of piling works | None anticipated |
| C24 | Construction | Damage to works by Employer or any of its Third Party Consultants and Contractors | Cost/Delay | 2 | 3 | 6 | Acceptable | Attendance and management of direct contracts during construction | No issues thus far |
| C25 | Construction | External detailing of building below expected quality | Client brief not met, delays to building handover, costs increase. | 2 | 4 | 8 | Undesirable | Appropriate quality control measures to be implemented during construction | Being dealt with through consultation with GGC Planning Dept. Discussions ongoing. |
| C26 | Construction | External materials not to required standard | Client brief not met, delays to building handover, materials don't meet life cycle expectations, costs increase. | 2 | 4 | 8 | Undesirable | Appropriate quality control measures to be implemented during construction | BCL continuing to meet expectations thus far |
| C27 | Construction | Failure to meet acoustic requirements of new building | Impact on patient health care and specialist departments | 2 | 5 | 10 | Undesirable | Appropriate quality control measures to be implemented during construction | Accoustics Logic and Astins liaised to identify solutions. Acoustics response to be provided for Board review. |
| C28 | Construction | Damage to completed works e.g. Ceilings, walls, doors, etc | Additional costs | 3 | 3 | 9 | Undesirable | Allow for adequate protection during construction | Damages will be managed accordingly. |
| C29 | Construction | Commissioning: providing adequate programme allowance for test and commissioning | Delays handover of new facility | 3 | 4 | 12 | Undesirable | Ensure sufficient time allowed in programme. Ensure that specialist Commissioning Manager is appointed and reviews all aspects of commissioning at an early stage. | Technical Commissioning Programme to be merged |
| C30 | Construction | Delays to piling due to obstructions | Additional cost and programme delays | 3 | 4 | 12 | Undesirable | Allow suitable risk allowance based on latest site investigation carried out during Stage 2; Review passing risk to contractor | Stage 3 Piling solution identified for tender. Identified that there will be no driven piles. |
| C31 | Construction | Air Tightness | Loss of BREEAM points, impair building operation and performance | 2 | 4 | 8 | Undesirable | Ensure protocols are in place to manage the construction and testing. | Ongoing tests at appropriate time |
| D1 | Design | All departments now detailed during Stage 2 and general design development during Stage 2 now impact on construction cost | Additional cost | 4 | 3 | 12 | Undesirable | Design development resulting from Stage 2 | Ongoing monitoring of design. Nearing completion - no issues so far |
| O1 | Operational | Delay/Consultation caused by Local Resident's Groups | Opportunity to promote project, Client and Contractor | 2 | 2 | 4 | Acceptable | Brookfield to implement Project Administration Manual, Corporate Social Responsibility Policies e.g. Neighbour notification schemes and appoint liaison manager. | Neighbourhood liaison will continue throughout Adult & Children's Hospitals Project. Cognisance taken of lessons learned for Labs Project |
| O2 | Operational | Delivery of materials causes disruption to others | Disruption to emergency vehicles, services, patients, visitors, staff. Potential H&S impact. Delays to material deliveries. Potential contamination from construction traffic. Delays to delivery could result in programme delays and increased costs | 2 | 5 | 10 | Undesirable | Agree delivery strategy at Stage 2 - residual risk only | Delivery management will continue through Adult & children's Project. Cognisance taken of lessons learned through Labs Project. |
| O3 | Operational | Distribution of materials on-site | Delays to construction, increased labour costs, loss, wastage and damage to materials, all resulting in increased costs. | 2 | 4 | 8 | Undesirable | Agree delivery strategy at Stage 2 - residual risk only | Management of the distribution on materials will continue through Adult & children's Project. Cognisance taken of lessons learned through Labs Project. |
| O4 | Operational | Failure to control dust (Aspergillus) | Patient, staff and public health care affected. Damage to property and damage to public perception. | 2 | 5 | 10 | Undesirable | Implement appropriate control measures e.g. dust suppression, water spraying, wheel washing etc. Managed use of abrasive wheel cutting tools and consider appropriate control e.g. Tents, all as detailed in the logistics plan. | Continuing to monitor dust levels. Any issues are reported to the weekly Construction Interface Group |
| O5 | Operational | Highways: Peak periods for access and egress | Disruption to emergency vehicles, services, patients, visitors, staff. Potential H&S impact. Delays to material deliveries. Potential contamination from construction traffic. | 2 | 4 | 8 | Undesirable | Consider outline planning consent conditions, implement traffic management plan, engage with Local Authority and Police on best methods. Introduce wheel wash and road cleaning operations, all as detailed in the logistics plan.. | The next phase of the Logistics Plan will be implemented |
| O6 | Operational | Maintaining blue light route | Delays to patient treatment. H&S implication. | 2 | 5 | 10 | Undesirable | Implement traffic management plan and close liaison with client. | Plans and Programme identified for stage 3 based on end November access to the SAS |
| O7 | Operational | Management / Provision of site facilities | Poor quality facilities may have an impact on productivity, conversely, good quality facilities helps to attract and retain good quality staff | 2 | 3 | 6 | Acceptable | Brookfield to give careful consideration to planning facilities and requirements and liaison with client on their requirements, all as detailed in the logistics plan. | Ongoing monitoring of provision of site facilities. Stage 3 plan prepared. Site facilities will expand as necessary. |
| O8 | Operational | Off-site parking for construction staff | Further congestion to surrounding area. Increased costs in provision of parking and worker transfer costs | 2 | 3 | 6 | Acceptable | Brookfield to consider renting suitable local premises, all as detailed in the logistics plan. | Off-site parking plans being finalised. In discussion to purchase nearby land. |
| O9 | Operational | Operational noise | Impact on patient health care. | 2 | 4 | 8 | Undesirable | Acoustic and vibration consultants to liaise with designers to ensure appropriate design and selection of equipment. | Ongoing monitoring. Noise activities identified in advance and neighbourhood notified accordingly |
| O10 | Operational | Shift working (e.g. noise during certain periods) | Impact on patient care. Potential stoppages resulting in delays and increased costs | 2 | 3 | 6 | Acceptable | Brookfield liaison manager to establish Client's guidelines, monitor and manage accordingly on site | Ongoing monitoring. Noise activities identified in advance and neighbourhood notified accordingly |
| O11 | Operational | Heli Pad: Disruption caused by construction works | Patient care affected by transfer times depending on location | 2 | 5 | 10 | Undesirable | Temporary heli pad located outwith site boundary | Helipad to be off-site March 2011 |
| O12 | Operational | Inadequacy of Security requirements - site wide | Health & Safety, personal security, staff wellbeing, theft, vandalism, fire etc resulting in delays and increased costs | 2 | 4 | 8 | Undesirable | Employ suitable site security throughout construction phase | Suitable security provision identified. Cognisance taken of lessons learnt from Labs Project. Existing contract working well. Contract will be expanded as necessary. |
| O13 | Operational | Disruption to existing facilities at location of links | Disruption to ongoing operation of facility | 3 | 4 | 12 | Undesirable | Robust method statements to be provided and agreed in advance of works commencing. Close liaison with FM | Ensuring that Method Statements are satisfactory. Construction Liasion Group kept fully informed. |
| O14 | Operational | Delays caused by protester action groups | Delay to project resulting in increased costs | 2 | 3 | 6 | Acceptable | Develop protocols in conjunction with Police, on-site security and Client's security team. | Not at this stage |
| P1 | Programme | The impact of incorrect program and duration by Contractor | Increased costs and delay to project | 3 | 3 | 9 | Undesirable | Brookfield to assess and provide a programme that is able to meet the overall requirements and achieve the Key Dates. | Ongoing review of programme |
| P2 | Programme | The impact of delivery due to poor project management | Increased costs and delay to project | 2 | 4 | 8 | Undesirable | Ensure pro-active project management and robust implementation of Project Execution Plan. | Project Management being carried out proactively. |
| P3 | Statutory | Compliance with WRAP | Increased costs | 2 | 2 | 4 | Acceptable | Understanding the WRAP requirements, evidencing what we are currently providing, providing a strategy and implementation thereof. | Ongoing. BCL will continue to comply with WRAP. |
| 1 | Business | The equipment costs exceed equipment budget (Group 1 - Purchased by Brookfield) | Included on NSGH Board Risk Register | 0 | 0 | | Acceptable | Included on NSGH Board Risk Register | |
| 2 | Business | Any other changes in VAT | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 3 | Business | Approvals sign-off (gateways) | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 4 | Business | Funding availability and cash flow | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 5 | Business | Land acquisition(s) for master plan of campus | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 6 | Business | Late payments by the Employer | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 7 | Business | The impact of "Compensation Events" to the Contractor (variations) | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 8 | Business | The impact of incorrect programme and cost estimates for decanting from existing premises | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 9 | Business | The non realisation of VAT reclaim and the introduction of new Statutory costs | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 10 | Business | Failure to achieve approvals at key dates and gateways. FBC approval | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 11 | Business | Inflation above the allowance in the contract | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 12 | Construction | Timing of provision of new sub-station | Installation by PU delays project and results in increased costs | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 13 | Construction | Discovery of existing basements under surgical block | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 14 | Construction | Discovery of mine workings | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 15 | Construction | Discovery of underground stream / spring | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 16 | Construction | Any unforeseen ground/site conditions under the footprint of existing facilities | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 17 | Construction | Asbestos | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 18 | Construction | Asbestos in culvert | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 19 | Construction | Discovery of existing basements | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 20 | Construction | Discovery of existing underground steam mains | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 21 | Construction | Discovery of Japanese Knotweed | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 22 | Construction | Discovery of unknown major services | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 23 | Construction | Relocation of orange aerial tower to accommodate land purchase | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 24 | Construction | Additional requirements for Police counter terrorism | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 25 | Construction | Unforeseen additional Equipment requirements | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 26 | Construction | Car Parking strategy changes | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 27 | Design | Any unexpected changes in medical technology | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 28 | Design | Impact of pre-construction demolition works on design | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 29 | Design | Impact of change in Employers Requirements (space and design standards) | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |

**Brookfield Risk Register** **Stage 3 - Design & Construction New Hospitals** **Date last reviewed: 14th September 2010**

Brookfield

| Risk | | | | Inherent Assessment | | | | Response | |
|---|---|---|---|---|---|---|---|---|---|
| Item | Category | Description | Risk Effect | P 1-5 | I 1-5 | PI Score | Strategy | Risk control measure or action taken to mitigate | Comments |
| 30 | Design | An increased demand for patient services from that agreed | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 31 | Design | Equipment (Group 1 & 2) varies from the information in the ITPD | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 32 | Operational | The non realisation of existing equipment transfers into new facilities | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 33 | Operational | Interaction of construction with day to day operation of existing hospital and interface with facilities managers | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 34 | Programme | Archaeology - Impact due to find | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 35 | Programme | Impact of delay in contractor gaining access to the site or availability of areas | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 36 | Programme | The Board do not provide a contract programme for the 33kV sub-station by the required date which is when the board approve the stages 1, 2, 3 & 3a | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 37 | Programme | Potential for impact of legislative or regulatory change, e.g. 1. Green issues 2. Environmental Planning standards | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 38 | Programme | Approval process / sign off of equipment plans & RDS if Board don't comply with agreed timescales | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 39 | Programme | Potential for delayed completion of enabling works by others, eg: 1. Site clearance 2. Car Parks 3. Substation | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 40 | Statutory | Inability to secure Planning approval: Labs/FM facility | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 41 | Statutory | Section 75 Agreements and conclusion thereof | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 42 | Statutory | The introduction and incorporation of changes to Scottish Government Health Department new requirements | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |
| 43 | Statutory | Planning authority don't comply with statutory response times when in receipt of correctly completed Application | Included on NSGH Board Risk Register | 0 | 0 | 0 | Acceptable | Included on NSGH Board Risk Register | |

The following transferred from Stage 2 Risk

| | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| B1 | Business | Achieving the NHS brief | Proposed final design solution rejected and increased costs and delay to programme for re-design | 1 | 4 | 4 | Acceptable | Ensure brief is understood by the Brookfield team and the Works Information provided by the Contractor and included in the agreed Contract adequately reflects the Boards design brief. Brookfield submission becomes Works Information as clarified in Commercial Dialogue Meeting no 3 | Acheived thus far |
| B2 | Business | Advance payments for material orders prior to FBC | Prices decrease; material wastage; storage costs; increased insurance costs | 2 | 4 | 8 | Undesirable | Prudent advance purchase of programme critical and cost sensitive materials. Schedule to be prepared at start of Stage 2 | |
| B3 | Business | Change Control and Management of Change protocol by the Contractor through the Design Team | Delay to Project and subsequent increase in Defined Cost | 2 | 4 | 8 | Undesirable | Implement Change Control from start of Stage 2 | Change Control Process in place |
| B4 | Business | Change in Contractor or Sub-Contractor management personnel | Loss of direction to project. | 1 | 3 | 3 | Acceptable | Ensure suitable management hierarchy in place. | |
| B5 | Business | Cost escalation given economic climate, prevailing market conditions over and above amount reimbursed by Board through RPI calculations | Increase in Defined costs | 3 | 4 | 12 | Undesirable | Ensure adequate consideration given to allowances at FBC stage. | |
| B6 | Business | Cost of extended warranties e.g. Performance bonds, PCGs etc | Increase in Defined costs | 1 | 4 | 4 | Acceptable | Ensure adequate allowance made within budget at outset. Agree terms with supply chain in advance. Seek to agree key Packages requiring bonds and period of bonds and establish by risk analysis the potential to reduce level of bonds and/or timescale for bonds. Consider other Insurance Products on the Market that may provide more economical solution. Where PCG is available from Subcontractor consider option to provide in lieu of bonds. Commercial Dialogue Meeting no 3 it was confirmed that Contractor Bond expires at Completion of each Stage. | |
| B7 | Business | Deflation | Presents both opportunity to reduce costs but may have a negative impact on commercial viability of supply chain members. | 2 | 3 | 6 | Acceptable | Brookfield team to make appropriate assessment. | Ongoing monitoring |
| B8 | Business | Incorrect Cost estimates for Adult & Children's' planning approval | Increase in planning fees | 1 | 3 | 3 | Acceptable | Ensure accurate estimate is provided. | |
| B9 | Business | Incorrect insurance rates included in tender | Increase costs | 1 | 3 | 3 | Acceptable | To be considered. Agree target price with key supply chain members early | |
| B10 | Business | Incorrect Level of Pricing in the Contractors tender pricing that cannot be managed out in design development process leading up to FBC | Increase in Defined Costs | 3 | 5 | 15 | Unacceptable | Benchmarking and market testing of all key elements of Contractor pricing. Peer review and tender settlement meeting. Key Supply Chain input. | |
| B11 | Business | Insolvency of supply chain / suppliers | Increased costs and delay to project | 3 | 4 | 12 | Undesirable | Ensure robust financial checks are undertaken on supply chain prior to appointment and that ownership of materials etc. are managed in accordance with Contract requirements. | |
| B12 | Business | Interest rate changes | Costs increase due to inflationary impact | 2 | 4 | 8 | Undesirable | Allowance included in Target Cost | |
| B13 | Business | Proper administration of NEC3 contract pre-contract | Delays to projects, increased costs and damaging to relationships | 2 | 4 | 8 | Undesirable | Set up NEC3 workshops to ensure that it is understood by all and ensure appropriate resources are in place to deliver. | |
| B14 | Business | Scope of packages | Scope missed and leads to increased costs. Package is too large to manage. | 2 | 5 | 10 | Undesirable | Robust procurement process to be implemented. Key suppliers already procured via Professional Services Contracts for Stage 2 | |
| B15 | Business | Step down agreements with sub-contractors | Supply chain members are unable to meet contractual obligations which leads to project delay | 2 | 4 | 8 | Undesirable | Ensure that terms and conditions are pitched at a level appropriate to the specific package of works. | |
| B16 | Business | Transparency of tender procurement process and out turn | Loss of trust and negative impact on relationships. Failure to agree contract price delays programme | 2 | 4 | 8 | Undesirable | Operate open book collaborative working throughout supply chain from start of Stage 2 | |
| B17 | Business | Change Control and Management of Change protocol by the Board | Uncontrolled change leads to increased costs delays to programme. | 3 | 4 | 12 | Undesirable | Implement Change Control from start of Stage 2 | Change Control Process in operation |
| B18 | Business | Inadequacy of existing Utilities services | Increased costs and delay to programme. | 3 | 4 | 12 | Undesirable | Identify requirements for new buildings early in Stage 2 design | Currently working with utility suppliers |
| B19 | Business | Cost of discharging planning conditions | Cost increase | 2 | 5 | 10 | Undesirable | Timeous submission of planning application and discussion with planners so conditions can be identified and costed prior to FBC submission | Changes made by Planning Dept |
| B20 | Business | Derogations - agreement and management | Confusion leads to increased costs. | 3 | 4 | 12 | Undesirable | Agree clear schedule of responsibilities and identify and clear derogations required at an early stage. | Derogations being identified at an early stage. Alternative design/derogations will sit alongside appendix K |
| B21 | Business | Additional temporary attenuation requirements until Stage 3A is completed | Additional cost and programme delays | 2 | 4 | 8 | Undesirable | Develop appropriate solution to include in target cost | Monitoring as project progresses |
| D1 | Design | Delays to procurement of materials | Delays to project and increased costs | 3 | 4 | 12 | Undesirable | Ensure supply chain adequate to suit size of project and that materials are sourced from a competent source. | Packages are being identified and broken down into manageable packages. |
| D2 | Design | Failure to provide knock-out panels in floors at columns | Impacts on future use of building | 2 | 4 | 8 | Undesirable | Include requirements within design | A part of design detailing |
| D3 | Design | Interfaces between external wall and structure | Lack of air tightness and weather permeability and thus non compliance with Section 6 of Building Regs | 3 | 4 | 12 | Undesirable | Interfaces to be designed and early dialogue to be undertaken between appropriate disciplines and supply chain members | Ongoing |
| D4 | Design | Kitchen strategy still to be determined | Requirements unclear - if full cooking kitchen is required hot smoke extract requirements will have to be incorporated into the design - additional cost | 1 | 3 | 3 | Acceptable | Requirements to be fully identified and designed during Stage 2 | Finalisation of kitchen strategy detail ongoing. Detail exchange continuing between Board and BCL. |
| D5 | Design | Escape bed lifts - requirements still to be fully defined | Requirements unclear in respect of final lift specification and M&E requirements - additional cost | 3 | 4 | 12 | Undesirable | Requirements to be fully identified and designed during Stage 2 | A part of design detailing - ongoing |
| D6 | Design | Radiation requirements still to be finally determined - location and heights | Additional costs | 3 | 4 | 12 | Undesirable | Final equipment locations to be determined during Stage 2; Proposal for permit to work above ceilings in these locations to be evaluated and agreed during Stage 2 | Final appendix K drawing package awaited by Board. |
| D7 | Design | Design development generally | Detailed design requirements result in additional costs - base design is at Stage C/D | 4 | 4 | 16 | Unacceptable | Implement Change Control from start of Stage 2 | Ongoing |
| D8 | Design | Access requirements for cleaning ETFE roof still to be determined | Additional costs | 2 | 3 | 6 | Acceptable | Identify requirements in conjunction with FM during Stage 2 | A part of design development |
| D9 | Design | 11 nr departments have been detailed - remaining departments have yet to be fully defined | Additional cost and programme implications | 0 | 0 | 0 | Acceptable | Fully determine requirements for all other departments during Stage 2 | Seperceeded by design development. Risk to be closed off |
| D10 | Design | Approval required from Glasgow City Council Roads Department for new foul out-let pipe | Additional cost and programme implications | 2 | 3 | 6 | Acceptable | Stats approvals to be logged early with programme float allowed | Changes to roads in discussion with GCC Planners |
| D11 | Design | Drainage assumes no hazardous / noxious discharges | Additional cost and programme implications | 2 | 4 | 8 | Undesirable | Requirements to be determined during Stage 2 | A part of design development |
| D12 | Design | Current level of geotechnical testing not robust to allow full assessment of design requirements for substructure and sub-soil treatment | Additional cost and programme implications | 2 | 4 | 8 | Undesirable | Carry out full detailed geotechnical and soil testing during Stage 2 to inform design | Further tests being undertaken for contamination |
| D13 | Design | Selection of appropriate piling solutions | Additional cost and programme implications | 3 | 4 | 12 | Undesirable | Confirmation of selected piling solution through Stage 2 design process | Piling solution achieved. Risk to be closed off |
| D14 | Design | Impact on design of flood risk assessment | Additional cost and programme implications | 3 | 3 | 9 | Undesirable | Carry out flood risk assessment during Stage 2 to inform design | Work finalising strategy nearing completion |
| D15 | Design | Impact of Traffic Assessment on design following conclusion of Masterplan | Additional cost and programme implications | 3 | 4 | 12 | Undesirable | Carry out final traffic assessment during Stage 2 | Completed. Risk to be closed off |
| D16 | Design | Failure to obtain approvals for proposed fire strategy solution | Additional cost and programme implications | 2 | 5 | 10 | Undesirable | Early consultation with Local Authority and Fire Officer. Brookfield Fire Engineer already appointed | Verbal agreement with Building Control, Building Standards Agency and Board's Fire Officer. Awaiting formal confirmation and 3rd party review |
| D17 | Design | Proximity of welfare facilities | Reduction in productivity leading to increased costs and time delays | 2 | 3 | 6 | Acceptable | Through logistics plan to be developed during Stage 1 - no risk to Stage 2 | Welfare facilities on-site and will be expanded accordingly. |

**Brookfield Risk Register** **Stage 3 - Design & Construction New Hospitals** **Date last reviewed: 14th September 2010**

Brookfield

| Risk | | | | Inherent Assessment | | | | Response | |
|---|---|---|---|---|---|---|---|---|---|
| Item | Category | Description | Risk Effect | P 1-5 | I 1-5 | PI Score | Strategy | Risk control measure or action taken to mitigate | Comments |
| D18 | Design | Quality of sub-contractors to service large work packages | Delays to the project | 3 | 4 | 12 | Undesirable | Ensure supply chain management procedures followed and as indicated above consider splitting of packages where practical. | |
| D19 | Design | Sustainable Urban Drainage System (SUDS) / attenuation - New Hospitals | Failure to consider leading to additional costs, location and volume - open/closed. To be adopted by Scottish Water? (Potential impact on construction) | 2 | 4 | 8 | Undesirable | Identify requirements and monitor incorporation into design. Early agreement of design principles with Scottish Water and SEPA. | SUDS work and Temporary SUDS works are still on-going. |
| D20 | Design | Waterproofing of basement | Leaking basements affecting function and operation. | 3 | 4 | 12 | Undesirable | Appropriate design and construction solution to be evaluated and within design seek to minimise extent of basement construction. | Design detail ongoing. Lessons learned from Labs Project |
| D21 | Design | Heli Pad: Permanent location (roof top) | Health & Safety, noise, cost, fire engineering and structural impact | 2 | 4 | 8 | Undesirable | Appropriate design solutions to be determined | Ongoing design |
| D22 | Design | Impact of sewage works | Odours impact performance of building in use | 2 | 3 | 6 | Acceptable | Appropriate design solutions to be determined | Ongoing |
| D23 | Design | Relocation of VIE and oil storage tanks within site | Delays to the project, increased costs and impact on existing hospital estate | 3 | 3 | 9 | Undesirable | Appropriate design solutions to be determined | Meeting to discuss final location of VIE will be arranged in due course. |
| D24 | Design | Restrictions on oversailing of existing buildings influences construction methods e.g. tower cranes | Increases costs and delays to programme due to possible restricted methods of workings | 2 | 4 | 8 | Undesirable | Requirements to be fully identified and included in target cost | Restrictors will be utilised on cranes. Lessons learned from Labs Project |
| D25 | Design | Condition and capacity of existing sewage system | Reinforcement works required to main infrastructure and leads to increased costs | 2 | 3 | 6 | Acceptable | Undertake condition surveys to ensure capacity and condition of existing systems and include requirements in design | Ongoing |
| D26 | Design | Dilapidation surveys | Disputes over status of existing facilities prior to works commencing | 2 | 3 | 6 | Acceptable | Ensure full joint survey undertaken and agreed with the Client | Dilapidation surveys completed |
| D27 | Design | Impact of any additional works at links to buildings including any reconfiguration | Links unachievable due to height restrictions. Failure to achieve DDA compliance and Gold Standard Achievements | 3 | 4 | 12 | Undesirable | Robust surveys to be undertaken to identify works required and include in design | A part of design detailing. BCL requested to look at Maternity link |
| D28 | Design | Additional Cost of Specialist consultants | Increased Cost | 2 | 3 | 6 | Acceptable | Brookfield to consider requirements and consider cost effects. | Nearing completion. |
| D29 | Design | Air Tightness | Loss of BREEAM points, impair building operation and performance | 3 | 3 | 9 | Undesirable | Ensure protocols are in place to manage the design | Will ensure design in place to ensure air tightness. |
| D30 | Design | Compliance with CAA Regulations - completed building | Impact on helicopter and existing aircraft operations which affect hospital function. | 3 | 3 | 9 | Undesirable | To be considered in design | |
| D31 | Design | Compliance with design tools | Failure to meet Client's tender submission requirements | 2 | 4 | 8 | Undesirable | Ensure compliance with client requirements and implement design toolkit recommendations. | Ongoing. Using AEDET |
| D32 | Design | Does the design fit on site | Fails to meet gateway approvals leading to programme delays and increased costs. Affects functionality of hospital. | 2 | 5 | 10 | Undesirable | Ensure all appropriate design and impact assessments are undertaken in accordance with Client's requirements and compliance with current outline planning consent conditions. | Design fits on site. Risk to be closed off. |
| D33 | Design | Drainage Discharge consent not achieved | Increased costs, time delay and site functions and operations | 2 | 5 | 10 | Undesirable | Early identification and an understanding of the requirements. Scottish Water | Nearing completion |
| D34 | Design | External detailing of building below expected quality | Client brief not met, delays to building handover, costs increase. | 3 | 4 | 12 | Undesirable | Ensure that Client's brief is met and implement appropriate quality control measures. | Part of the GCC Planning Process |
| D35 | Design | External materials not to required standard | Client brief not met, materials don't meet life cycle expectations, costs increase. | 3 | 4 | 12 | Undesirable | Undertake life cycle cost exercise to establish best solution e.g. higher capital cost, lower maintenance cost. | Part of the GCC Planning Process |
| D36 | Design | Failure to meet acoustic requirements of new building | Impact on patient health care and specialist departments | 2 | 5 | 10 | Undesirable | Acoustic consultant already part of Brookfield team. Hospital requirements v SHTM's. | Process to be implemented in due course. |
| D37 | Design | Fire services - The provision of any additional means of escape | Increased cost and time implications. Spatial impact. | 2 | 5 | 10 | Undesirable | Ensure understanding of requirements and compliance with Building Regulations and NHS fire code. | Part of the Fire Strategy. Links to D16 |
| D38 | Design | General design quality by Contractor | Client brief not met, delays to building handover, costs increase. | 3 | 4 | 12 | Undesirable | Ensure that Client's brief is met and implement appropriate quality control measures. | To be commenced |
| D39 | Design | Inadequacy of emergency generator provisions | Disruption to hospital services including existing buildings | 2 | 4 | 8 | Undesirable | Identify requirements, liaise with Client's external consultants and include within design. | Ongoing design development. |
| D40 | Design | Inadequate Coordination of design | Increased costs and programme delays | 3 | 4 | 12 | Undesirable | Ensure design fully coordinated and review of 3D modelling prior to completion of Stage 2 | Ongoing |
| D41 | Design | Inappropriate selection of plant and equipment | Programme delay / advantage and cost increase / saving | 2 | 4 | 8 | Undesirable | Early dialogue between Brookfield, designers and cost consultants with emphasis on LCC to select 'best methods'. | Ongoing. BCL linking with Board's FM reps |
| D42 | Design | Late design information from sub-contractors | Time delays and cost increases | 3 | 3 | 9 | Undesirable | Ensure good programme management and early appointment of supply chain. Professional Services contracts for key supply chain members during Stage 2 | Ongoing |
| D43 | Design | Design development to pods in atrium | Additional cost | 3 | 4 | 12 | Undesirable | Finalise design requirements during Stage 2 | Ongoing |
| D44 | Design | No catchment survey for drainage system | Additional attenuation. Cost | 1 | 4 | 4 | Acceptable | To be considered during Stage 2 | Ongoing |
| D45 | Design | Poor Design development and management | Uncontrolled change leads to increased costs delays to programme. | 2 | 4 | 8 | Undesirable | Develop appropriate solution to include in target cost | Design development being managed. EW and Change Control processes in operation. Ongoing using AEDET |
| D46 | Design | Poorly considered innovative design / materials solutions | Lack of knowledge results in poor construction leading to building failure resulting in increased costs and delay. | 2 | 4 | 8 | Undesirable | Ensure all solutions are fully explored, including life cycle cost plans. | Good ideas being put forward. Work ongoing |
| D47 | Design | Vibrations in new building causing damage to sensitive equipment | Impact on hospital operations and function. Damage to equipment resulting in increased costs. | 3 | 3 | 9 | Undesirable | Liaison with acoustic and vibration consultants and undertake sensitivity analysis, vibration analysis etc. During FBC Design Stage | Currently not at this stage |
| D48 | Design | Increase to agreed schedule of accommodation: Rooms, circulation, plant rooms, other | Increased costs and time delays | 2 | 4 | 8 | Undesirable | Implement change control with design team from start of Stage 2 | A part of the design review process. SoA will be updated to provide total brief. Risk to be closed out once updated SoA recieved by Board team |
| D49 | Design | The change to and flexibility of the building to meet future clinical delivery | Cost increase & time delay | 2 | 4 | 8 | Undesirable | Identify requirements early in stage 2 | No major changes anticipated |
| D50 | Design | Agreement of building cleaning strategy | Increased costs and time. Impact on building design and performance related to location of heli-pad | 2 | 2 | 4 | Acceptable | Early consideration and understanding of Board operations to ensure compliance with CDM requirements and include in design | To be commenced at an appropriate stage. NHS and BCL to liaise to identify detail of strategy |
| D51 | Design | Compliance with Security / Terrorism issues i.e. Category A prisoners | Safety of patients, staff, visitors. | 2 | 3 | 6 | Acceptable | Understand Client's requirements and agree and implement appropriate design solution. | Part of design development. Ongoing review of requirements. Met with Strathclyde Police. Identified that they wish to utilise 'Secure by Design' |
| D52 | Design | Consideration in Design to prevent cross infection (MRSA and similar infections) | Failure to comply with design requirements leading to FBC rejection and/or increased costs | 2 | 5 | 10 | Undesirable | Comply with HTM and Scottish NHS design guidelines. | Part of design development. |
| D53 | Design | Delays in decisions regarding introduction of Robotics | Increased costs and time delays | 2 | 2 | 4 | Acceptable | Engage with Client and specialist designers to determine requirements and sophistication required early in Stage 2 | Part of design development. |
| D54 | Design | Department of Child and Family Psychiatry ligature free design | Patient healthcare affected, danger to health & safety and non-compliance with design requirements | 2 | 4 | 8 | Undesirable | Incorporation and implementation of recommended design guidance. | Ongoing |
| D55 | Design | Fire services - The provision of any additional fire fighting requirements | Increased cost and time implications | 2 | 3 | 6 | Acceptable | Compliance with Building Regulations and NHS fire code. Fire engineer employed by Brookfield | A part of the Fire Strategy |
| D56 | Design | Implementation of Euro codes and changes to Building Regulations | Increased cost and time | 2 | 3 | 6 | Acceptable | To be considered by Brookfield | A part of design development. Ongoing. |
| D57 | Design | Incorrect vertical transportation strategy | Spatial impact, cost impact, time delays | 2 | 4 | 8 | Undesirable | Cost consultants, design team and supply chain to liaise at an early stage to ensure best solution is selected. Ensure design advanced at an early stage. Ensure chosen manufacturers have available manufacturing capabilities in line with programme requirements. | Work ongoing. Board to review BCL revised lift strategy proposal |
| D58 | Design | Privacy / Dignity issues not adequately addressed | Patient health care and wellbeing impaired. Increased costs and time delays. | 2 | 5 | 10 | Undesirable | Understand and agree design parameters with the Board. | Part of design development/review |
| E1 | Environmental & Sustainability | Achieving BREEAM Excellent | Increased costs. Failure to meet rating leads to bid rejection | 2 | 3 | 6 | Acceptable | Early consideration of requirements and liaison with Brookfield's appointed BREEAM consultant to confirm requirements. BREEAM consultant to carry out initial BREEAM assessment of design. | Ongoing. Regular meeings scheduled. On target to achieve BREEAM Excellent. |
| O1 | Operational | Poor signage - new build | Impact on visitors to hospital | 2 | 3 | 6 | Acceptable | Brookfield to consult with the Board and agree suitable way finding and signage. | Part of wayfinding strategy. Ongoing liaison with Board team |
| O2 | Operational | Protection from roosting birds/bats | Health & Safety | 1 | 2 | 2 | Acceptable | Appropriate design measures to be implemented. | Part of design development |
| P1 | Programme | The impact of incorrect program and duration by Contractor | Increased costs and delay to project | 3 | 3 | 9 | Undesirable | Brookfield to assess and provide a programme that is able to meet the overall requirements and achieve the Key Dates. | Programme developed and continually monitored. |
| P2 | Programme | Approval process/sign off of 1:50 equipment plans and Room Data Sheets (effect of delays to overall design, construction and procurement, Reviewable Design Data (RDD) process) | Increased costs and delay to project | 2 | 4 | 8 | Undesirable | Brookfield and NHS GGC to agree and work within the approval and sign-off process. | Approval and Sign-off process agreed. Process to be commenced in due course. |
| P3 | Programme | The impact of delivery due to poor project management | Increased costs and delay to project | 2 | 4 | 8 | Undesirable | Ensure pro-active project management and robust implementation of Project Execution Plan during preconstruction | Project Management being carried out proactively. |
| S1 | Statutory | Inability to secure Planning approval: Adult and Children's Hospital e.g. Tower height & massing, car park solution, TPO removals | Delay to project and increased costs | 2 | 5 | 10 | Undesirable | Ensure continual liaison with Client and Planning authority to ensure no surprises. | Ongoing liaison with GCC and NHS team. |

# *APPENDIX I*

# *DRAFT COMMISSIONING PLAN*

## *Appendix I*

## *Draft New South Glasgow Hospitals Commissioning and Migration Plan*

### Introduction

The New Builds will comprise an Adult Hospital comprising 1109 in patient beds and a Children's hospital comprising 256 beds. Overall 6000 new rooms will require to be commissioned.

The services moving to the new site are spread over 5 existing locations within 25 separate buildings. Over 5600 staff will be relocated to the new site and will include admin, Allied Health professionals, doctors, managers, nurses, scientific and technical and facilities.

In order to plan and prepare for the migration of services to the new hospitals a robust commissioning structure needs to be established. A proposed format of that structure is found in Appendix 1.

### Commissioning Timescales

It is proposed that the service migration will take place over a five – month period from 1/2/15 – 30/6/15. This is based on the assumption that the hospital will be 'Technically Ready' by 31/1/15

Services will be grouped & moved in the following order:

| | |
|---|---|
| Group A | Adult OPD |
| Group B | Adult Intermediate Care (inc MHU at VIC) |
| Group C | Children's Hospital (subdivided into 2 phases C1 OPD & C2 Inpatients) |
| Group D | SGH Inpatient & Acute Care |
| Group E | VIC Inpatient & Acute Care |
| Group F | WIG Inpatient & Acute Care |

The proposed service migration programme is shown on Appendix 2.

### Group A Mapping Exercise

A mapping exercise has been undertaken to test the Group A transfers. This will comprise the move of the adult Outpatient Department & Therapy Centre, which will be refurbished into offices to accommodate 309 NCH staff. This will facilitate the transfer of the clinical services from Yorkhill to the New Children's Hospital.
Appendix 3 lists the Group A services to transfer and reflects their current locations and where they will locate to in the new building.

### Commissioning Management Structure

The management structure for the Commissioning shown on the attached Consolidated Schedule of Group members and Terms of Reference.

Appendix 1

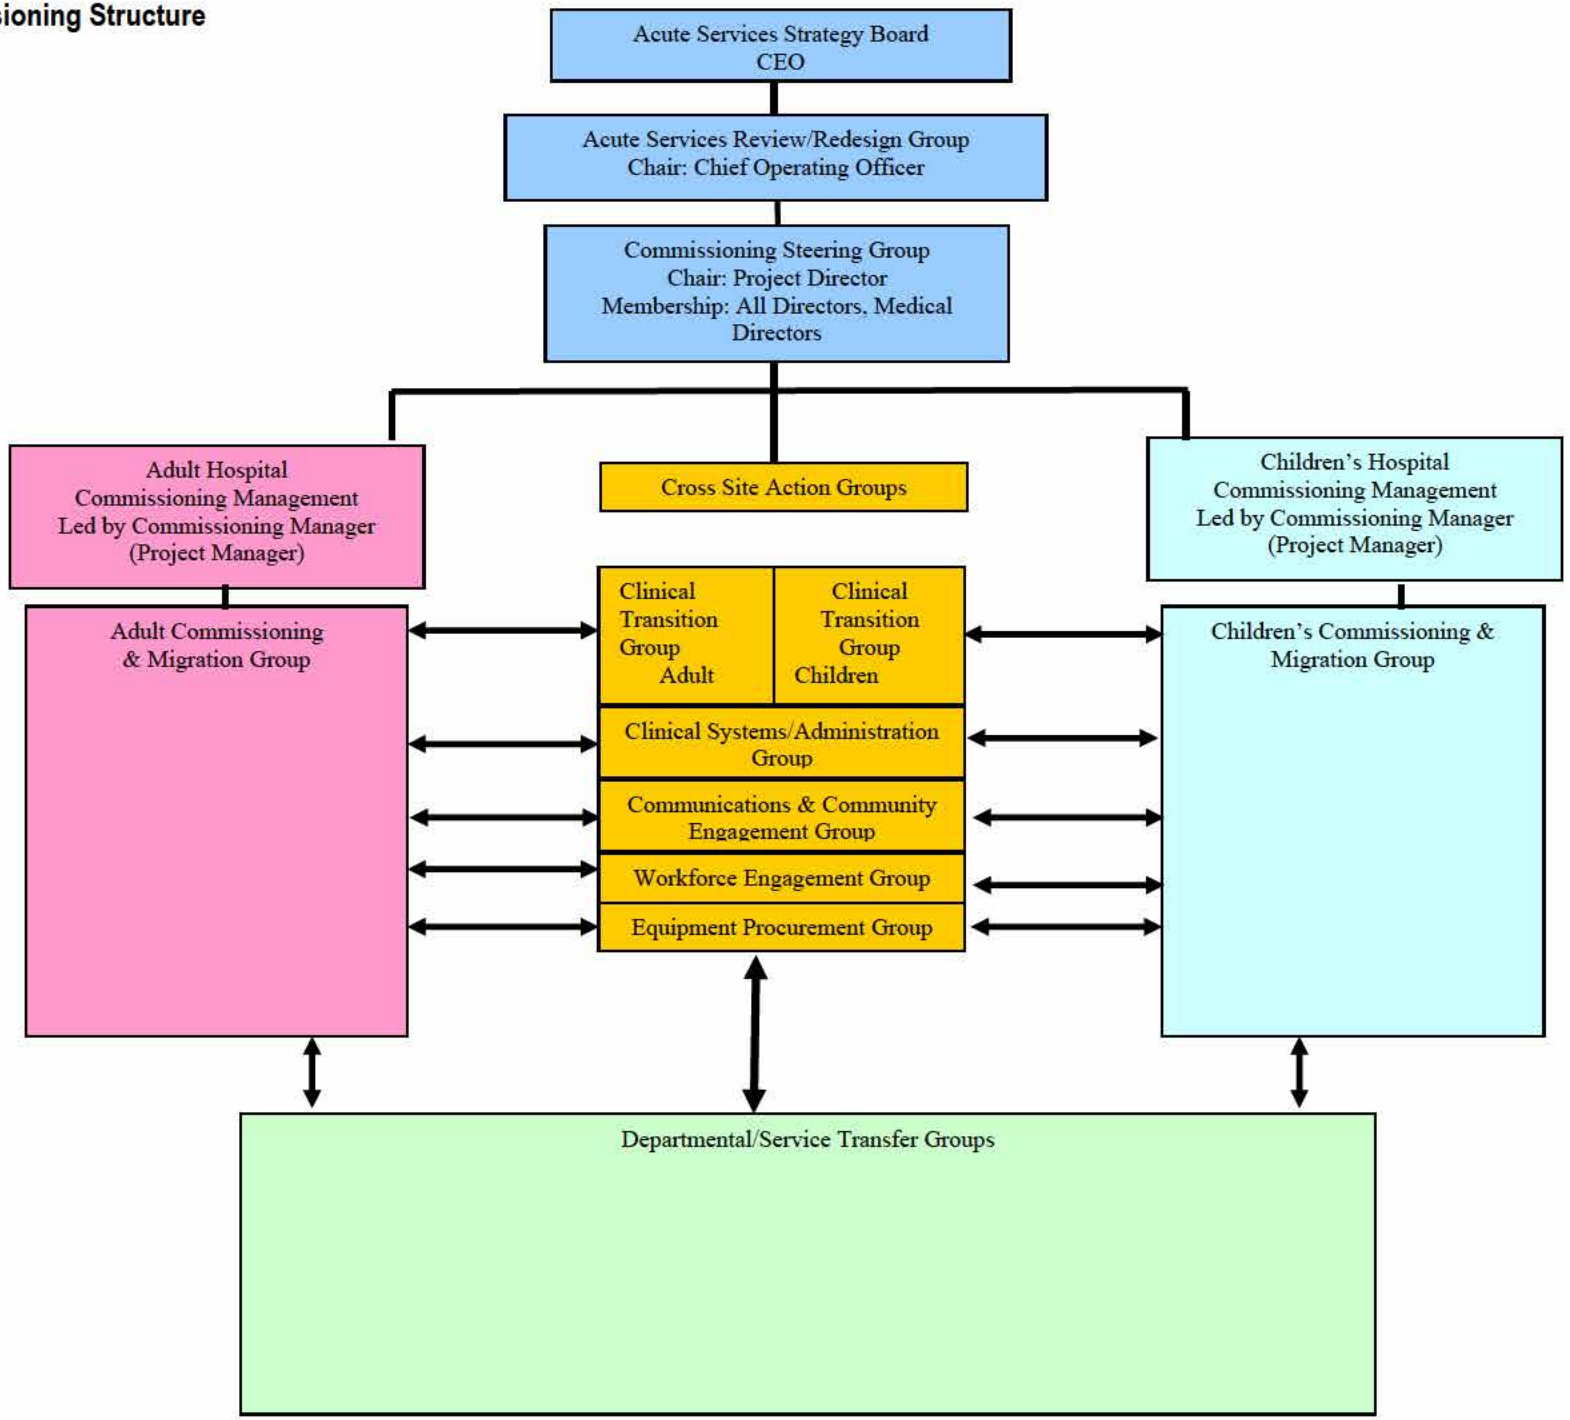
NHS
Greater Glasgow and Clyde

# NSGH COMMISSIONING

## Consolidated Schedule of Group Members and Terms of Reference

**Issue No 1**
**August 2010**

**Commissioning Structure**



| PROJECT: | NSGH COMMISSIONING |
|---|---|

| Group: | Commissioning Steering Group (CSG) | Reporting To: | Acute Services Review Group |
|---|---|---|---|
| Group Leader: | Alan Seabourne | Leader: | Jane Grant |

| Group Members: | Name | Designation | Responsibility/Role |
|---|---|---|---|
| | Alan Seabourne | Project Director, New South Glasgow Hospitals | Project Director |
| | Mairi Macleod | Project Manager, New Children's Hospital | Children's Commissioning Manager |
| | Heather Griffin | Project Manager, New Adult Hospital | Adult's Commissioning Manager |
| | TBA | Staff Partnership Representative | |
| | | | |
| | **Directors to nominate representatives for Membership of Group** | | |

## 1.0 Introduction

The development of these proposals have pursued an integrated approach to master planning, building design and clinical planning for all elements of the new hospital. The goal is a hospital that is a fine piece of architecture- an elegant simple solution to a complex problem.

Hospitals are by virtue of their arrangement and multiplicity of services complex buildings. The big challenge to designers is to create a positive patient environment that also helps staff deliver complex clinical processes in a non-institutional environment. The answer in these proposals is simplicity- a building that can be easily understood by all of its users- both in its form, layout and relationship to the landscape.

Its impact on the local and city urban context is understood and it is hoped that its potential to achieve an iconic status may be realised through the provision of a facility that will offer exemplary healthcare facilities, improve staff retention and create an environment that is much more than an institution.

This document has been compiled to specifically explain the proposals in relation to Matters Specified in Conditions 2. This condition refers to Siting, External Appearance and landscaping. It should be noted that matters relating to Landscape are contained in a separate document which should be read in conjunction with this document.

In addition, it is understood that matters relating to sustainability, transport, artwork integration etc., which are described in separate Matters Specified in Conditions, are addressed in separate documents and are not therefore discussed here.

Aerial view of campus

### 1.1 Outline Planning Permission

In April 2007 the Board lodged an outline planning application with Glasgow City Council which was accompanied by an Environmental Statement. The planning application and ES were the subject of consultation with an extensive range of statutory and non statutory bodies, agencies and the general public. The application was reported to the Council's Development and Regeneration (Development Applications) Sub Committee in January 2008, with a recommendation for approval. The Sub Committee voted to grant outline planning permission subject to 43 planning conditions and the signing of a Section 75 Agreement. The outline planning consent for the New South Glasgow Hospitals project was issued by Glasgow City Council on 30 July 2009.

The consent states that subsequent planning approvals will be dealt with as 'Reserved Matters'. This two-stage approach means that there will be a requirement for reserved matters applications to be scrutinised by the planning authority to determine whether further environmental information and assessment is required to allow the detailed consideration and determination of reserved matters.

The proposed Condition No. 2 of the Outline Planning Consent states that:

*Approval of the details of the siting, design and external appearance of the building(s), the means of access thereto and the landscaping of the site (hereinafter called the reserved matters) shall be obtained in writing from the Planning Authority prior to the start of any work on site. All reserved matters to be submitted for approval within three years of the date of this permission.*

***Reason**: In compliance with Section 59 of the Town and Country Planning (Scotland) Act 1997.*

2007 Campus Development Plan

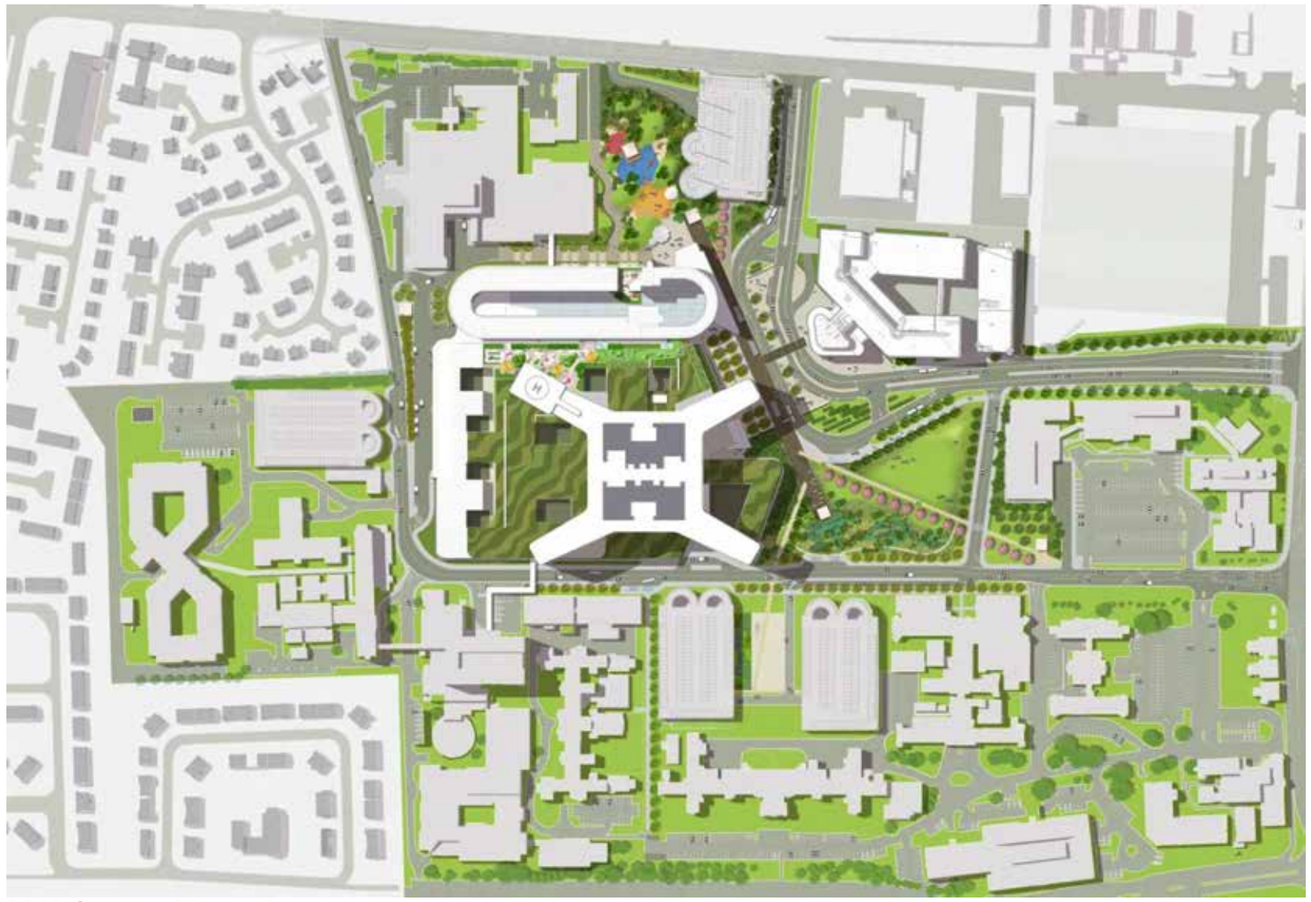
2009 Campus Masterplan

With the implementation of the Development Management component of the Planning Etc. (Scotland) Act 2006 on the 3 August 2009, the submission of 'reserved matters' applications was replaced by the submission of 'Matters specified in Conditions' applications.

### 1.2 Approval of Masterplan

In April 2010, a Matters Specified in Conditions (MSC) application (Ref: 10/00945/DC) was submitted to Glasgow City Council to audit the changes between the indicative campus masterplan and the finalised masterplan, and assess the extent to which the finalised masterplan accords with the ES, as required by Condition No.1 of the Outline Planning Permission. The application outlined the following information.

- Setting the scene
  - Strategic Context
  - 2007 Campus Development Plan
  - 2009 Campus Masterplan
- 2010 Masterplan
  - Site Context
  - Design Vision
  - Masterplan Layout
  - Landscape Framework
  - Elements of the Masterplan
- 2010 Masterplan Strategies
  - Transportation
  - Site Circulation
  - Landscape
  - Drainage
  - Arts and Healthy Environment
  - Sustainability



2010 Campus Masterplan

The MSC application was approved by Glasgow City Council on 24 June

2010, subject to six conditions addressing issues including waste management, surface water, residential amenity, and wind turbines.

### 1.3 Architectural Design Statement

This architectural Design Statement accompanies the 'Matters specified in Conditions' application for the Adult Acute Hospital, the Children's Hospital and the Energy Centre. This Design Statement follows the principles set out in the Scottish Government's Planning Advice Note No. 68 Design Statement published in August 2003. It sets out to explain the scheme in terms of the brief, analysis of context, design development (following consultations) and the final proposals. This statement should be read in conjunction with the relevant submitted application drawings as well as the approved 2010 Campus Masterplan document.

Aerial view of campus viewed from north east

## 2.0 Context

The New South Glasgow Hospitals project is located on the existing 28 hectare Southern General Hospital site, situated on the south side of the River Clyde in the Govan district of Glasgow. The surrounding land uses consist of a mixture of residential to the south and east, industrial and business to the west, hi-tech industry to the north and the Shieldhall Wastewater Treatment Works to the northwest. The area is suburban in character. The local environment is low in quality and most of the built form is industrial in design and poor quality in terms of fabric and finished materials. The existing hospital site dates from 1872 and contains a mix of buildings of varying ages and architectural style and quality. The buildings are arranged in a campus layout with the oldest group of buildings concentrated on the eastern side. The Grade B listed Central medical block provides the most architecturally significant building to be retained within the campus.

Further development took place in the 1900s and 1950s, followed by the Maternity Unit in 1970 and the Institute of Neurological Sciences in 1972. Additions in the last 5 years have included the Department of Medicine for the Elderly, the Westmarc building, extensions to both biochemistry and pathology buildings, and the recently commissioned Neonatal Unit. New structures recently completed and those nearing completion within the site also provide a reference for these proposals. In particular they help to form the basis of a palette of materials and building form. Existing built form varies between four and six storeys and consist of a mix of materials ranging from render, pre-cast concrete panels, stone, brickwork and aluminium panelling.

The importance of recognising and responding to both the local and city context has been emphasised during pre-application consultations which has led to GCC's extension of the Glasgow Urban Model to cover the Govan context and to allow accurate testing of proposals.

Study Images using Photomontages
And Glasgow Urban Model

## 3.0 Design Brief

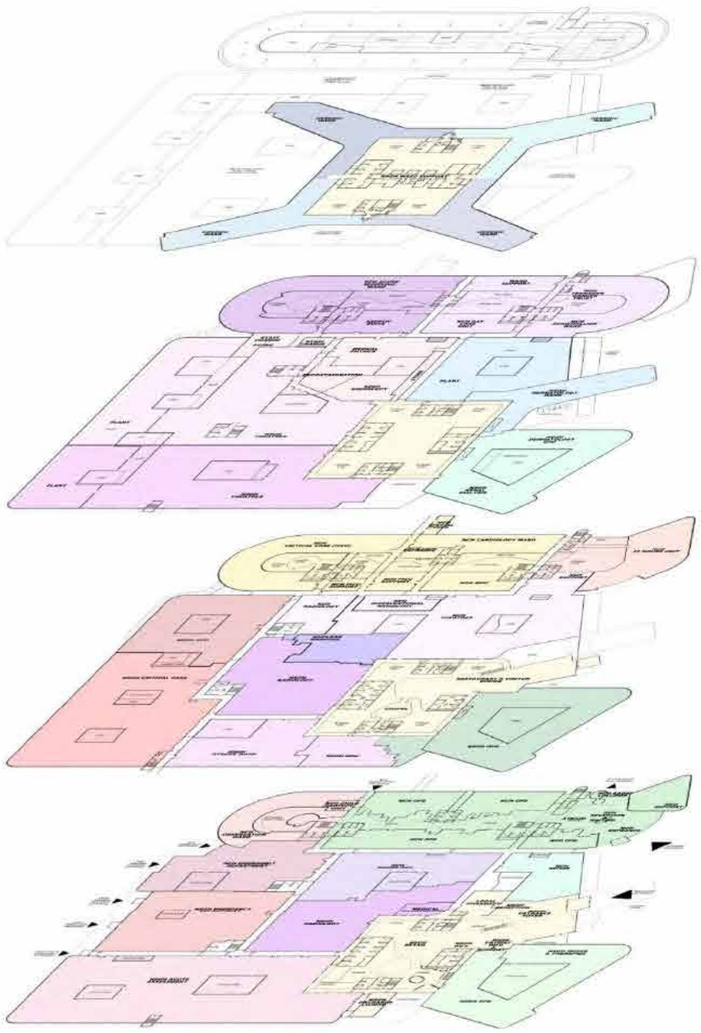
NHS Greater Glasgow and Clyde (The Board) has over the past ten years been developing its Acute Services Review (ASR) to modernise the acute adult health service within its area. The second phase includes the provision of a new Adult Acute Hospital, a new Children's Hospital, laboratory facilities, and associated support areas and other site facilities and infrastructure on the Southern General Hospital site.

The new Adult Hospital will be one of the most advanced acute hospitals in the UK with facilities including 1,109 adult beds, and the biggest critical care complex in Scotland catering for an estimated 110,000 A&E attendances per year. The Adult Hospital is scheduled for completion in early 2015. This will provide some 1,700 beds on campus to meet the healthcare needs of the local, regional and national population that the hospital campus serves. The Adult Hospital will sit alongside and be physically linked to the National Spinal Injuries Unit, the Institute of Neurosciences, and the Maternity and Neonatal Units.

The proposed 244-bed Children's Hospital will be integrated with maternity and adult hospital services to ensure immediate access to specialist services to provide the highest quality and safety standards for mothers, children and babies. The Adult and Children's Hospitals will be built as a single integrated building. The new Laboratories Facility will be detached but physically linked to the new hospitals via a service tunnel. The laboratories block will accommodate haematology, biochemistry, medical genetics, microbiology, and mortuary and post mortem services.

The following requirements have also been specified by the Board in their Employers Requirements as essential factors:

- Development of an integrated adult acute and children's hospital providing the full range of acute health services which functions



Diagrammatic Stacking Diagram of key internal functions

efficiently, effectively and economically optimising the Boards operating costs. The clinical functions must be provided in a high quality care environment which is accessible to the community, welcoming, safe and aesthetically pleasing. The design must also fully reflect the special needs of each patient group it caters for and as a whole should be fully accessible to the widest variety of patient groups possible.

- The development must remain flexible to allow future change and expansion. The buildings must provide spaces that assist patients feeling of belonging and not being intimidated, and which may help with their orientation, mobility, confidence, privacy and ability to socialise. This may be achieved through use of materials, lighting, shape, scale, mass and form.
- The design should respect the local environment and make a contribution to the local context whilst clearly expressing its function both in external and internal appearance. The size, distribution, material and proportion of the design should reflect the clinical function of the building.
- The contractor shall develop building design solutions which create an ordered composition of building elements in a stimulating form that successfully combines good standards of space, height, form, scale and use of materials and colours/images with associated functional requirements and its surroundings.
- The form of the Adult and Children's hospitals, while mutually compatible should have an identifiably distinct character expressed both externally and internally as befits the nature of the patient groups.
- Design should compliment and enhance the quality of the locality in which it is sited. It shall create a welcoming, inclusive and vibrant environment and shall enable easy access by the community. It should be seen as a leading edge community resource reflecting the objectives of the modern NHS in the regeneration of healthcare facilities.

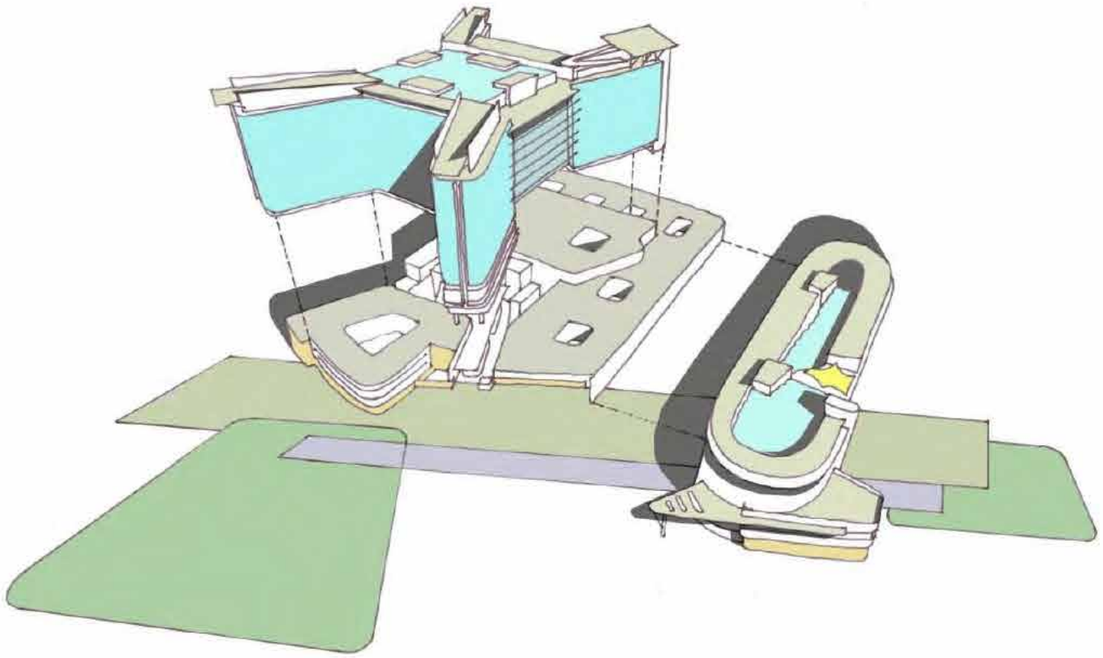
# 4.0 Architectural Design – Concept & Resolution

## 4.1 Introduction

The 2010 Campus Masterplan sought to make the best possible use of the site and the opportunities presented by the requirements of the brief. The arrangement of the buildings, routes and public spaces has been defined to create a user-friendly setting for this significant new landmark healthcare development for Glasgow. The design and layout of the site seeks to underpin very positive experiences of a high quality site for patients, staff and visitors. The masterplan is based upon the establishment of a durable parkland character which will enable the campus to evolve and grow over time in response to healthcare demands and opportunities for redevelopment of particular areas of the existing NHS estate.

The masterplan proposes a strong axial approach from Govan Road to a new plaza/arrival hub from which entrances to all key facilities are accessible and legible. The introduction of two major parks, one for the adult acute facility and one for the children's hospital, is also fundamental to the 2010 masterplan's success in creating a strong framework from which the architectural propositions can emerge. Establishing a strong landscape setting for the building footprint, with foliage proposed immediately adjacent to key area/departments has been a key driver for the landscape element of the masterplan.

The key components of the architectural proposition are given a distinct identity, in accordance with the client's brief, whilst maintaining a considered approach to continuity and hierarchy of material selection. Accordingly, the scheme is conceived as the integration of three distinct elements: the beacon (containing the adult inpatient ward accommodation), the dock (containing the adult acute treatment and diagnostic facilities) and the vessel (the children's hospital). These three elements are given their own architectural character whilst ensuring that



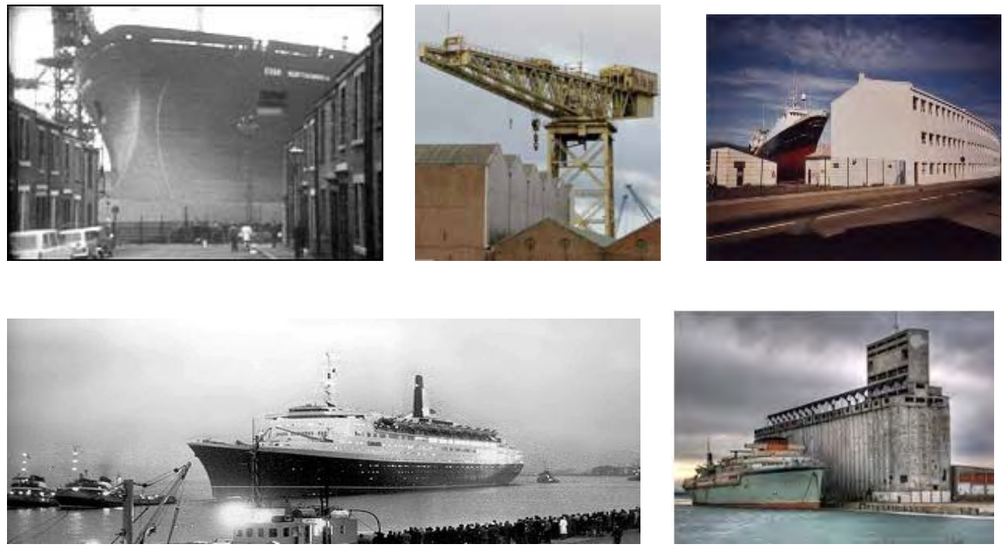
their expression remains within the overall framework suggested by the campus approach to the masterplan recognising the client's existing estate and other planned developments including car-parks and the proposed laboratory facility.

**4.2 Concept & References**

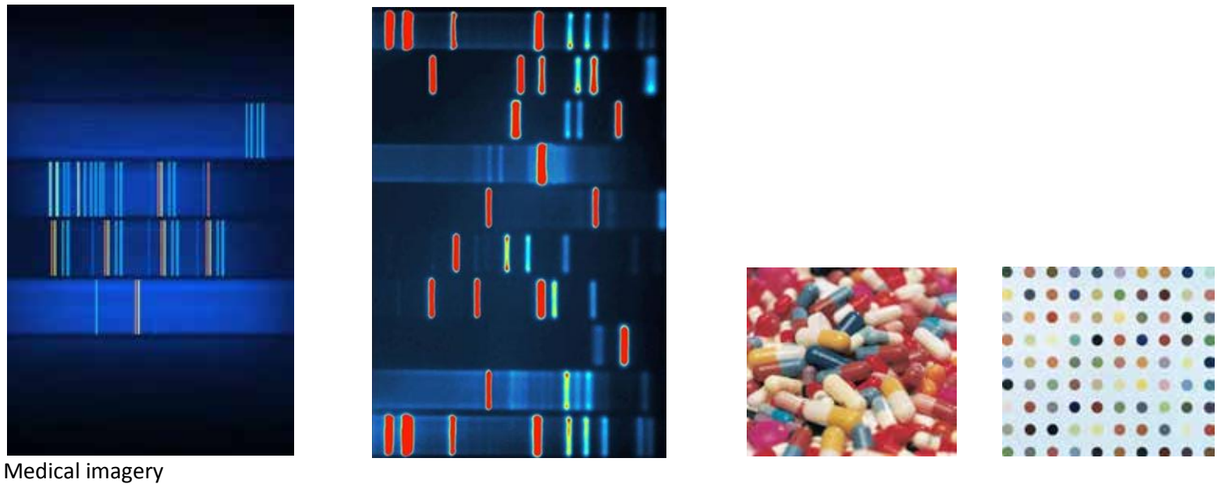
To a large extent, the scheme has been pre-determined by the 2007/2009 exemplar which set fixed parameters for the location of the building and the way in which it connects to existing facilities. The need to ensure that the existing A&E dept continues to operate throughout construction and the requirement to connect in the East and West directions to Neurosciences and Neo-Natal buildings pre-determines the buildings location to the South of the site. In particular the connection to the Neo-Natal building locates the children's hospital to the South West.

These requirements naturally shape the key components of the hospital into a natural grouping of forms consisting of a children's hospital, an accommodation block catering for adult inpatients and a large linking block containing all day, diagnostic emergency and adult outpatient facilities. Given the scale and complexity of the proposed hospital facilities, a simple conceptual approach to these key components has been adopted. Accordingly, and embracing the maritime/ship-yard heritage of the local Govan context, these components have been termed the 'Beacon' (In-patient block) the 'dock' (adult podium upon which the 'beacon' sits) and the 'vessel' (the children's hospital, 'moored' to the 'dock'). This approach assists in dealing with the scale of the building and provides a framework within which the desired architectural identity of each component (in particular the children's hospital) can be expressed.

As well as maritime references, medical imagery has also been a key driver in the conceptual thinking, in particular in relation to facade composition and use of colour. The DNA strand has been adopted as an appropriate reference upon which to build a series of themes that may inform the



Dock/ship yard imagery



Medical imagery

composition of external windows and panel systems.

Adoption of this theme throughout the scheme assists in providing the level of consistency demanded by the campus approach advocated by the master plan whilst subtle use of colour and expression of form ensures that elements are distinct where necessary.

**4.3 Adult Inpatient Block – 'The 'Beacon'**

The adult inpatient facility consists of 1109 single bedrooms, each with en-suite bathroom facilities. Early studies considered whether inpatient facilities could be divided into a series of smaller units, in order to mitigate the scale of the building, however clinical requirements and the need for centralisation has resulted in a single, contiguous block broadly reflecting the design decisions taken in the 2009 Exemplar scheme. The inpatient block consists of 8 floors with four 28 bed wards provided per floor (typically). In order to allow a degree of flexibility of use, and in particular to allow notional departmental boundaries to adjust to meet varying service demands, the plan form of this block is arranged to ensure a continuous 'ribbon' of bedroom accommodation around the perimeter. This approach ensures the optimum response to this requirement and, coupled with the 'internalisation' of fire escape and vertical circulation cores, allows every inpatient bedroom an uninterrupted view with zero overlooking onto other bedrooms. This innovative approach to ward planning also provides the opportunity for each ward to be arranged around a central, covered day-lit atrium. The adult atrium provides a naturally lit, temperate space for provision of day-light to 'internal' spaces and at its base, for orientation, waiting and amenity. The connection of the two proposed 'FM' circulation cores by bridge links at levels 4 to 11 also provides an opportunity for drama through the expression of staff offices as coloured pods linked to the bridge. Although conceived as a continuous ribbon of bedroom accommodation the plan form opens up at the end of each wing through the introduction of a shared 'social space'. This space allows a direct visual link to the outside, exploits elevated panoramic views

View of main arrival space and inpatient block

and provides an appropriate termination to the internal ward corridor axis.

The 'beacon' sits upon the adult podium (dock) and is separated from it by a clearly delineated interstitial plant floor. The interstitial floor is set back from the main facade line wherever possible and is expressed with a continuous ribbon of aluminium ventilation louvers.

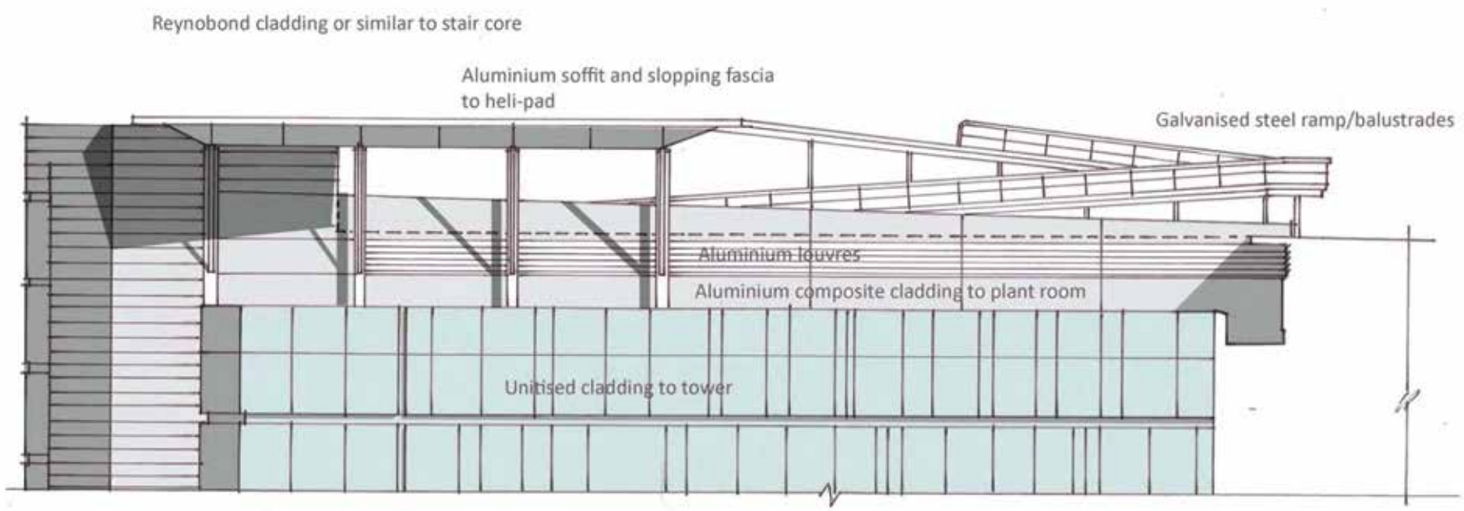
The material strategy for the inpatient 'beacon' is discussed in further detail in section 7 below. The beacon is conceived as essentially glazed with alternate pairs of floors grouped and separated with a horizontal recessed channel. This device mitigates the effects of scale and introduces a strong horizontal emphasis.

**4.4 Heli-Pad**

The provision of a helipad for a proposed hospital of this scale and importance is to be expected and further technical details regarding the potential effects of the proposed pad location have been submitted separately. The pad is located on the roof of South Western wing of the inpatient block in order to provide a direct vertical connection with the emergency departments. Accordingly, given that this 'wing' is the only one where vertical circulation is provided, a different expression is employed compared to the other wings via the use of aluminium panelling. The pad itself must by its nature meet many technical/safety criteria and as such has a minimum size and strict requirements for safety catch-nets, access ramps and fire-fighting equipment. The soffit treatment of the pad and the expression of supporting structure have been considered with the provision of exposed diagonal struts and aluminium panel soffit, lit from below as an architectural feature.

**4.5 The Adult Podium – 'The 'Dock'**

Having located all adult inpatient facilities in the beacon the remaining (OPD, diagnostic, day, emergency, interventional) adult facilities are all contained in the podium (dock).



Partial elevation of proposed heli-pad

The dock consists of three storeys of clinical accommodation (with plant on a fourth floor where necessary) and, given the amount of clinical accommodation required within it (and their adjacencies) fills the available area. Accordingly courtyards and light-wells are inserted into strategic locations to mitigate any 'deep-plan' effects and to ensure adequate access to day light and view.

The dock is treated as a simple architectural element. Horizontal emphasis, through the use of recessed channels aligning with the building floor levels, with full-height vertical panels/windows set within the bands, provides an appropriate back-drop for the more expressive 'Beacon' and 'Vessel'. The adoption of the 'DNA' theme at first and second floor levels ensures a consistency of approach.

Further narrative on the material treatment is contained in section 7.

**4.6 Children's Hospital – 'The 'Vessel'**

The children's hospital, whilst sharing some adult facilities in the podium (theatres) is in effect an additional hospital in its own right. Containing 244 beds, the 'vessel' also provides dedicated facilities for children's OPD, critical care, and mental health. In response to a specific requirement of the brief, i.e. to invest the children's hospital with an identity all of its own, the building is conceived as a more transitory form, 'moored' alongside the 'dock' (adult podium). It is in the 'vessel' that maritime references are most evident. The 'apsed' North and south treatments, whilst a response to the need to maximise the notional flexing of departmental boundaries in the upper inpatient floors, are also intended to provide a clear sense of identity and a link to maritime forms. The building is arranged as a simple linear block on the West side of the site, to connect to existing Neo-Natal block. The block is arranged with a 15m wide atrium separating the East and West sides, providing a large, internal, day-lit, temperate space. The atrium provides a large, covered amenity/waiting space as well as an intuitive

View of children's hospital from the children's park

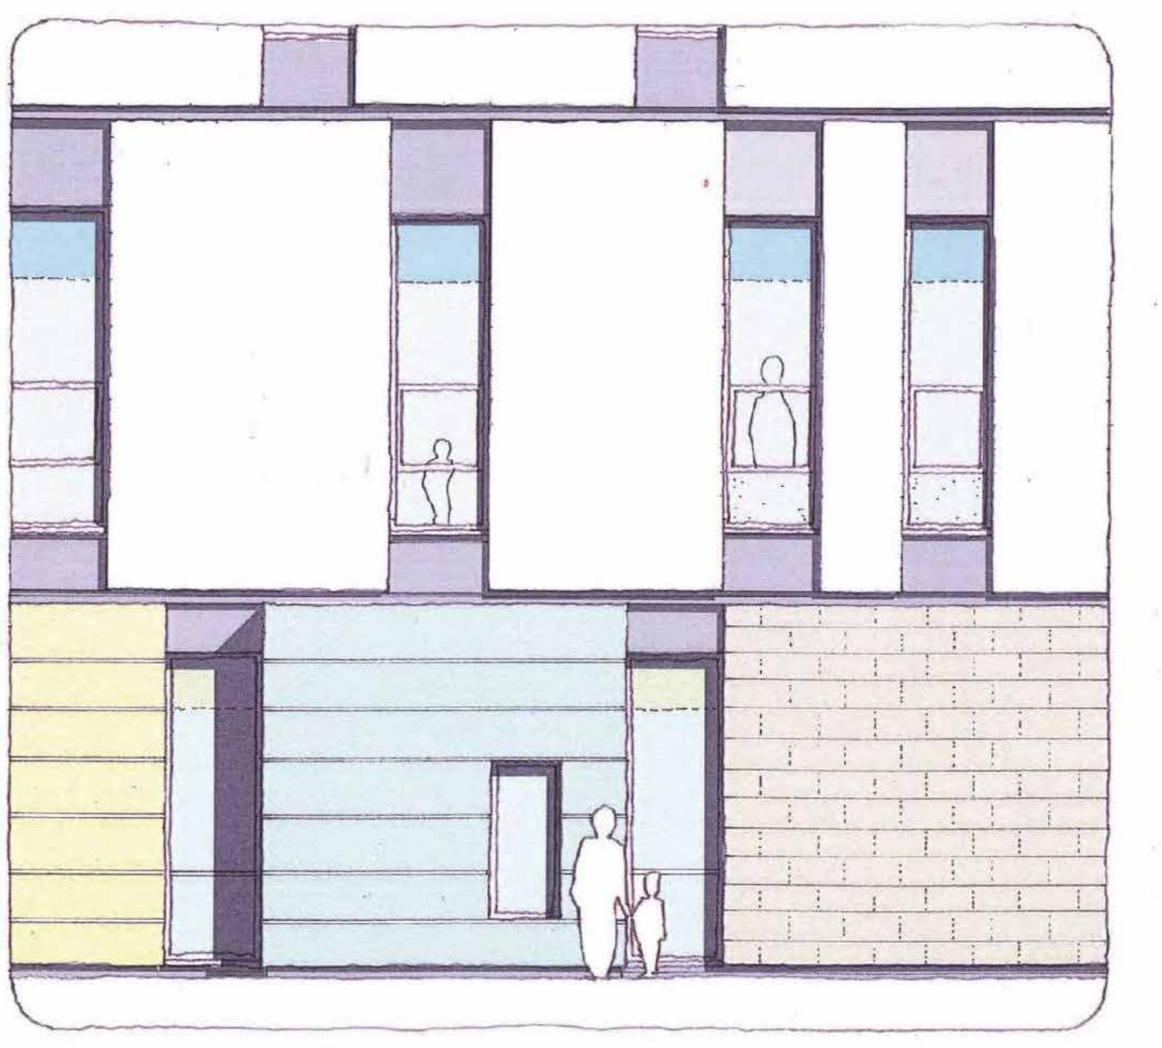
internal way-finding device providing easy access to key vertical circulation cores.

Externally, an emphasis is placed upon the North and North Western facades (facing the arrival space and children's park). As mentioned further in Section 6 below, the main entrance and adjoining facilities at levels 1 and 2 have been developed to ensure response to the diagonal geometry and link between parks, as well as appropriate level of transparency and openness at the entrance.

Further detail on the material treatment is contained in section 7 below. The'DNA' theme is employed in the compositional treatment of the vessels' facades, ensuring a consistent campus approach to the suite of buildings. In this case, in order to express the identity of the children's hospital, and to encourage a degree of 'playfulness', vertical coloured fins are applied radially around the entrance facade and along the West facade, where oblique views when moving North or South along the facade can be exploited. As a further gesture to integration with the children's park the consult/examination suites on the Western facade have been expressed as coloured 'play-boxes'.

**4.7 The Energy Centre**

Part of the suite of buildings that make up these proposals is the energy centre. It will contain the main boilers, absorption chillers, standby generators and switch gear for the whole campus. As such, the energy centre is a critical component in the realisation of the master-plan in that it will provide key services to all the major new buildings featured in it, which include the adult and children's hospitals and the laboratory buildings. Given its relationship to these adjoining facilities, its detailed design and layout of engineering services needs to be informed by the buildings it is serving. The finalised locations of exhausts/ventilation louvers, maintenance requirements and the impact this has upon the façade composition, therefore continues to be refined. Accordingly, and following



Detailed façade study of the children's hospital

discussion with GCC, the illustrative images adjacent which represent the proposed intent will undergo further refinement to the North and East elevations through ongoing dialogue with GCC.

Notwithstanding the above refinements, the submitted proposals do clarify the location, scale and basic form of the energy centre and the following aspects are noted:

The energy centre is located immediately adjacent and to the north of the laboratory building and will consist of three stacked floors of enclosed engineering space with an open roof-top zone of external plant, bounded by screening. Given the size and operational requirements of the equipment, floor-floor heights are (6m approximately) so the overall height of the building is equivalent to five or six standard storeys and is not dissimilar to the adjacent laboratory block.

The energy centre is conceived as a simple cube-like structure which takes its under-lying design direction from the strong context offered by the adjacent laboratories building. The vertical emphasis to fenestration/louvers, use of a masonry base and adoption of a white panelled back-drop to the façade composition are all factors that are intended to be adopted in the energy centre façade composition.

In addition, it will be one of the first buildings encountered upon arrival down the proposed 'boulevard' off Govan Road. The building could therefore function as a gateway to the site and could offer possible opportunities which will be explored through dialogue with GCC.

Energy Centre – development studies. Note – the above images are for information only and are subject to further development and supplementary submissions

## 5.0 Related Planning Approvals

### 5.1 Multi Storey Car Park A1

Three main multi-storey car parks (MSCP) are proposed adjacent to the separate Adult and Children's Hospitals' entrances to reduce walking distances from parking spaces to the main entrances.

Glasgow City Council granted detailed planning permission for Multi Storey Car Park 1A on 15th September 2009 (Ref: 09/00361/DC) . Work commenced in the construction of Car Park 1A in April 2010.

### 5.2 Laboratories Block

In July 2009, NHS-GCC submitted a detailed planning application (Ref: 09/01676/DC) for the provision of some 23,500 sq m of medical laboratory accommodation, including mortuary facilities and facilities management for the new adult and children's hospitals. The planning application was accompanied by the 2009 Campus Masterplan which provided an update of the 2007 Campus Development Plan to reflect the exemplar design to be procured through a Design and Build Contract. Glasgow City Council granted detailed planning permission for the laboratories facilities on 01 December 2009, subject to thirty-two planning conditions addressing a range of issues including materials, roads, trees, landscape design, flooding and drainage.

View of proposals from east and new multi-storey car parks

## 6.0 Consultations & Design Development

### 6.1 Consultation with Glasgow City Council

Since engagement on the implementation of the successful bid proposal in January 2010 a number of detailed workshops, briefings and meetings have been held with Glasgow City Council representatives in order to ensure an adequate level of consultation and collaboration. In relation to the architectural scheme, prior to submission, seven sessions have been held and the submitted proposals have developed over the course of these sessions in response to the discussions held.

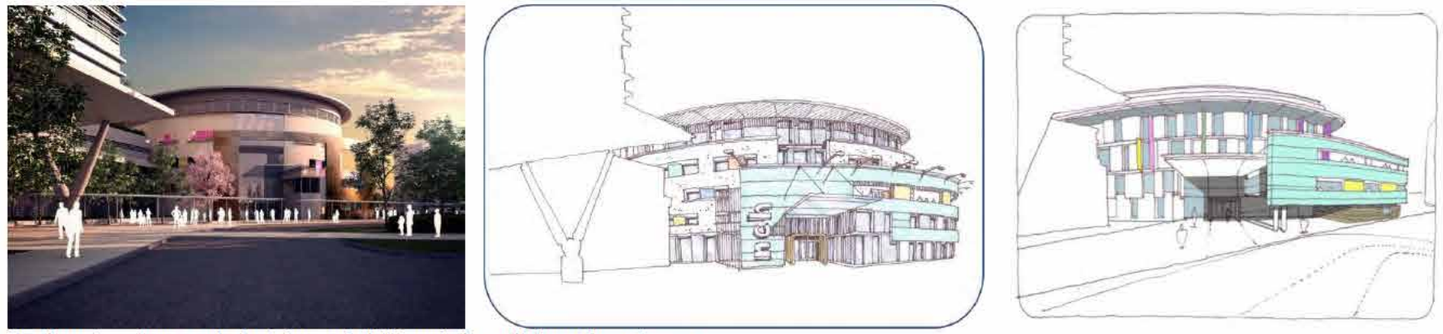
### 6.2 Consultation with Architecture & Design Scotland

In addition, two pre-application engagements with Architecture and Design Scotland (A+DS) have taken place. On 21st April 2010 a pre-application presentation was made to an A+DS review panel, principally to explain the masterplan proposals which were submitted subsequently on 22nd April 2010, but also to gain comments on the direction of the architectural design at that stage. A+Ds recorded their comments in a report dated 10th May 2010.

Following receipt of A+DS's comments a document was issued to A+DS on 24th June 2010 summarising the extent to which the proposals had addressed the feedback recorded in their 10th May report. It is understood that although A+Ds will be formally consulted following submission of the application, a further Design Review Panel presentation will not be necessary, based upon the content of the information submitted on 24th June 2010.

### 6.3 Design Development

The principal areas of design development which emerged are discussed



Design development sketches of children's hospital main entrance

Final proposals for children's hospital main entrance

below and responded to the following key areas of concern as raised by GCC during early workshops:

- The degree to which the two main parks ('Central' park and the children's park) are connected both physically and visually.
- Following the above, the arrangement of architectural elements that made up the main arrival space was deemed too disparate and lacking clarity.
- Material selection – principally the predominant use of render to all elevations at the lower levels of the scheme, including the key public realm interfaces.
- The uniform treatment of the inpatient 'tower' and the lack of consideration of orientation and urban aspect.

Prior to engagement with A&DS on 21st April 2010, the scheme was refined in order to respond to these concerns as follows:

- As discussed extensively in the Master-plan submission, a key development in the genesis of the design was the introduction of the 'dock' element. The dock, a geometrical device for linking the two main parks and providing an organisational mechanism for all elements arranged along the main arrival space, consists of a clearly expressed surface treatment which also imposes a rigour to the whole arrival interface. This new approach specifically introduced a re-working of the lower floors of the children's hospital entrance façade to embody a new geometric emphasis.

- As a response to both the comments received and the requirement for increased internal clinical space, a greater degree of playfulness and engagement with the children's park was introduced through the projection of the consult/examination rooms in a westerly direction and their expression as large 'play-block's through the use of coloured cladding.

Sketch view of 'pedestrian dock'

- Material selection was reviewed with a view to achieving a more hierarchical approach to the differing degrees of public interface across the main facades. Principally, the locations proposed for render was reviewed together with the use of rainscreen cladding panels.

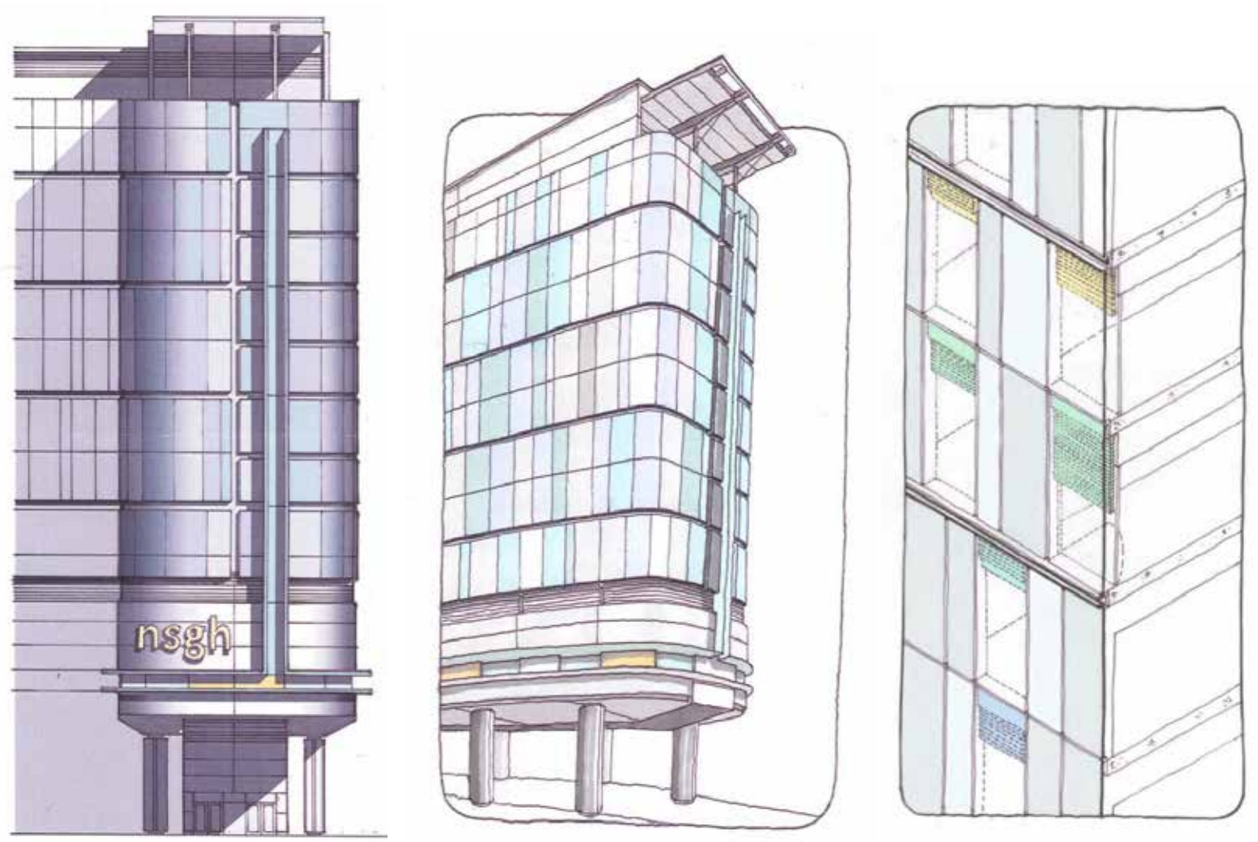
- The inpatient 'tower' and its articulation was reviewed with a view to sub-dividing the form into two recognisable 'halves' arranged either side of an east/west facing central linking element, together with expressing the social spaces introduced into the ends of each tower 'wing'.

Following the receipt of comments from A&DS on 10th May 2010, further refinement was undertaken as follows:

- The report identified the need to further review the articulation of the proposed inpatient block ('the beacon'). Issues identified included the uniform, flat roof-line and the extensive use of glass as a cladding material. In response, the scheme has considered the silhouette of the scheme, through study of the Glasgow Urban Model, and now proposes a more expressive roofline through the emphasis of an extended eaves condition to each wing and sloping parapet walls to the plant rooms.

- A simplified approach to material selection was also suggested in the report. The response suggested a hierarchical approach that emphasised the northern, arrival space facing façade and accepted that elements of the remaining facades could be treated according to their function/location. A detailed description of the proposed material selection is contained in Section 7.

- Following the report's recommendation that the legibility of the entrances facing the main arrival zone should be reviewed, the children's hospital entrance has been re-configured to better



Development sketches of proposed inpatient block

respond to the geometry of the 'dock' and to ensure adequate space is provided between the building edge and the Fastlink drop-off allowing the large amount of foot-fall expected from the western car-park to be adequately catered for.

- Further commentary contained in the report referred to the treatment of courtyards and internal aspects including the main atrium and hospital streets. Further detailed commentary regarding the treatment of courtyards is contained in the Landscape document. The final resolution of the atrium and hospital street spaces is subject to ongoing user engagement.

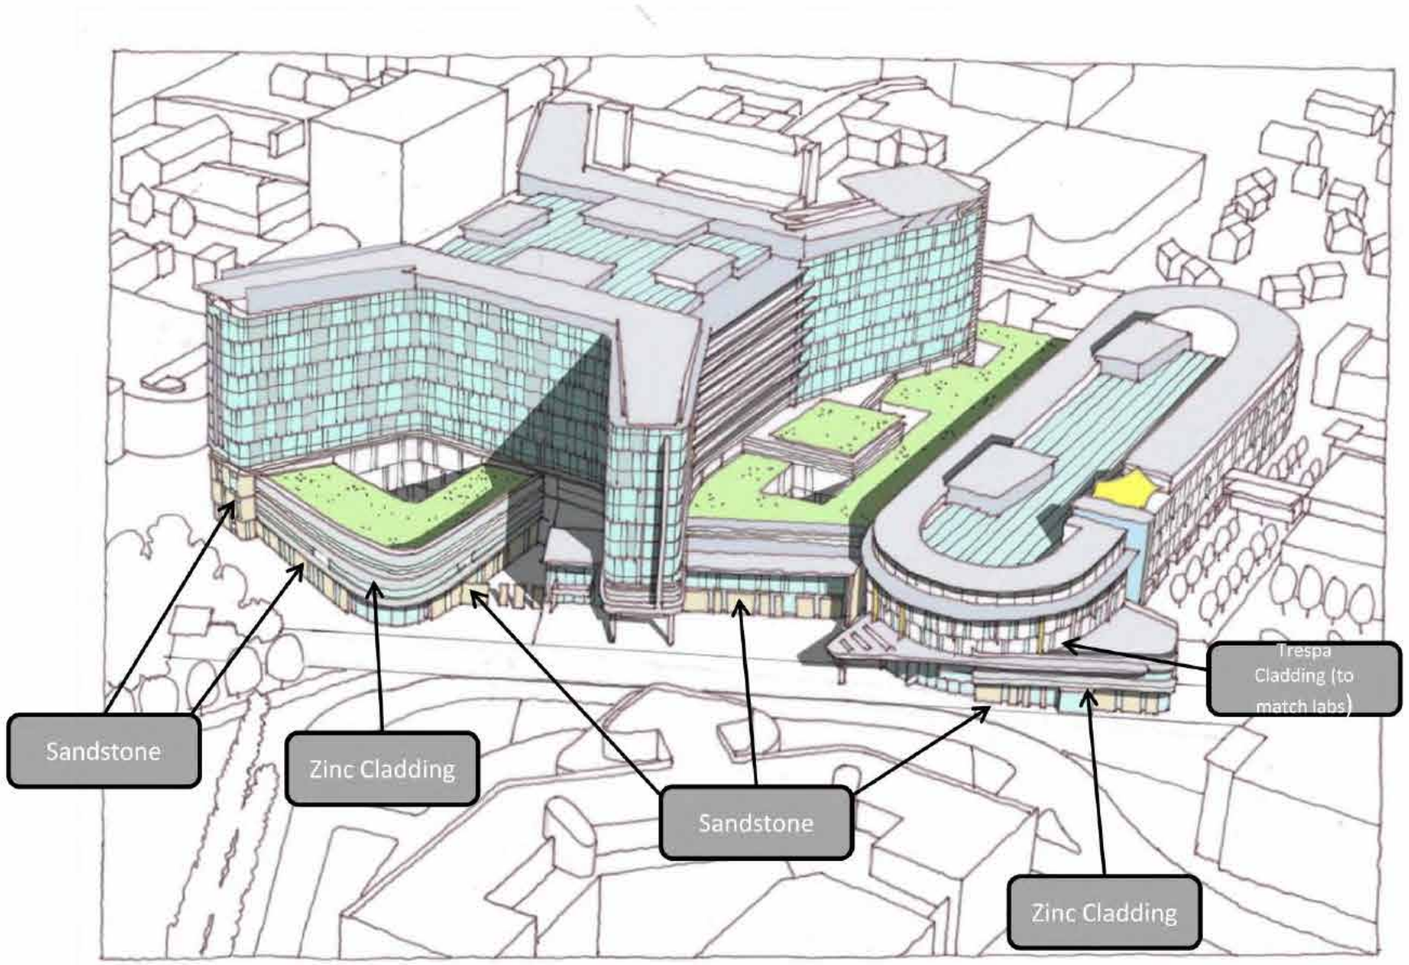
## 7.0 Materials/Finishes Strategy

### 7.1. Hierarchy

Engagement with GCC Planning department has identified the strategy for material selection and the adoption of an 'hierarchical' approach being key issues for discussion and development. It has been recognised that the scheme has a varied degree of public interface with some facades being dominant, due to the presence of main entrances such as the north elevation, and other facades, some of which are more functional such as the south façade where A&E is located, being treated in a more subservient manner. There has been an acceptance therefore that a uniform application of materials is not strictly necessary and that some facades, particularly where the main arrival zone is looked upon, should have an enhanced treatment.

### 7.2. Public Realm - North Elevation/Main Entrances/Public Park

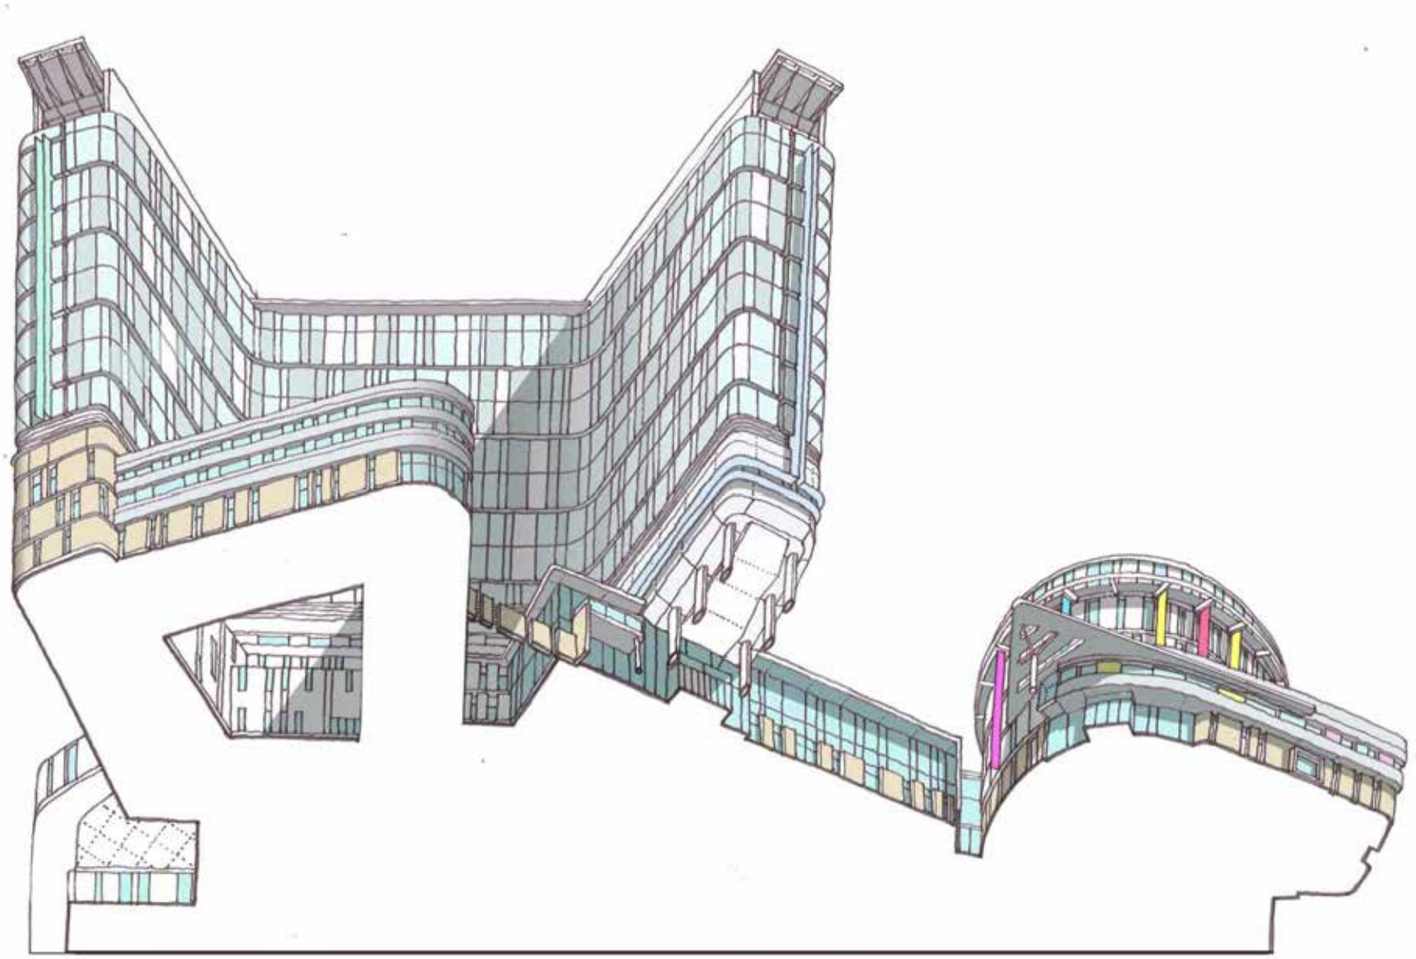
The importance of areas of major public interface has been recognised in material terms, particularly in relation to building facades that face the arrival zone (outside the laboratory block) and the main eastern car-parks/children's park. The north elevation and the return facades opposite, to the east, the main car-parks, and to the west, the children's park, and its reading as the main public face of the building has therefore been focussed upon as an area where the material treatment should be enhanced. Accordingly, high-quality natural materials are intended to be applied to these key areas. Natural sandstone (to match that installed at the existing neo-natal building and proposed car-park structures) is proposed as a plinth with fenestration adopting the 'DNA' patterning advocated in the base concept and used elsewhere. The curvilinear forms of the children's hospital and the outpatient block, which both engage with the diagonal 'pedestrian dock' element indicated in the masterplan, are expressed in zinc panelling with horizontal standing-seam joints. The material link between these two elements will provide the consistency and continuity to the arrival zone



frontage demanded by the masterplan whilst maintaining individual building identities.

Coloured panels are proposed between windows within the horizontal slots to the OPD block and projection to the children's hospital.

Matching the main panel treatment used in the laboratory block, the northern end of the children's hospital has a similar treatment through the use of vertical high-pressure laminate rainscreen panels (Trespa or similar). The base of the inpatient block, elevated above the main entrance to the adult facility, is expressed in aluminium panelling, which continues as a soffit treatment, as indicated in the sketch 'worm's-eye' view which has been generated in order to consider soffit treatments to this key façade.



'Worms Eye' Axonometric View of Northern Facade

### 7.3. Secondary/Tertiary Elevations/Spaces

Other areas of the building also adopt the 'DNA' approach mentioned above with a focus on panels of either masonry blockwork to ground floor areas with upper floors using through-colour render systems. Separation of render panels vertically, via the introduction of horizontal aluminium channels, assists in binding the whole composition together and mitigates against potential workmanship/weathering problems associated with render and the incorporation of movement joints, drips etc. The eastern, southern and western facades follow a treatment which uses a robust plinth (good quality facing blockwork) at ground floor with upper floors in render. Plant floors are treated with insulated aluminium panelling with continuous banks of horizontally laid aluminium ventilation louvers.

### 7.4. Inpatient Block

The inpatient block/beacon is expressed as a consistent glazed form. As discussed, with the expression of the block as two halves separated by a central linking element, the pairs of wings facing either north or south are

arranged in paired horizontal bands, separated by a recessed aluminium channel. The proposed glazing system is a unitised curtain walling system with no visible external transom/mullion caps. Vertical mullion lines are arranged based on a series of module widths. Verticals do not continue beyond paired floors with a staggered vertical effect lessening the uniformity that might otherwise result and enhancing the horizontal emphasis. As well as transparent elements ( a full height panel for each patient bedroom) the inpatient block cladding consists of a range of coloured enamel-backed glazed spandrel panels. These panels have a range of colour treatments with tones ranging from white through several shades of grey to a heather/grey purple colour. The colour is proposed to have a greater intensity on the flat north/south facing facades with a reduction as one moves towards the ends of each wing.

Colour is also proposed to be applied within the interior of each patient bedroom providing a layered approach. Opportunities to exploit the possibilities offered by applying colour to internal bulkheads/reveals and interstitial blinds fitted within a tertiary glazing system are being considered and will add further interest and depth to the glazed façade approach.

The ends of each wing (with the exception of the south western wing accommodating the helipad lifts/stairs) is highlighted with a pair of aluminium fins, located to accord with one of the main perimeter structural columns, and with a coloured central panel intended to be up-lit at night. These fins continue to form horizontal brise soleil elements to the horizontal windows at level 2 on the main entrance wing.

The linking central facades facing east and west are given a different treatment in order to break down the mass of the block, especially when viewed from a distance from the east and west. Rather than continuing the fully glazed treatment, this section is expressed as a more solid element through the use of aluminium panelling with a darker grey colour.

# Introduction

## Introduction

This document is part two of the Design Statement which has been prepared to discharge a number of conditions contained in the formal Matters Specified in Condition for the New South Glasgow Hospitals project. Part one presents the design intent for the architectural proposals. Part two (this document) relates to the external environment. The conditions are summarised below. This document is primarily concerned with Condition 2 – Site design, external appearance and landscaping but also responds to:

- No. 5 Tree Survey and Arboricultural Report,
- No. 8 Tree Protection Method,
- No. 26 Pedestrian and Cycle Routes,
- No. 28 Cycle Parking Provision .

## Structure of this Document

The first section places the MSC into the planning context for the project and describes in outline the process related to the consented 2010 Campus Masterplan. Section two presents the design proposals for the landscape and public realm. As such, it describes the designed places which together form the external environment of the hospitals, including primary arrival spaces, parks, internal courtyards, green roofs and roof gardens. These individual places are described in terms of their form, their function and their design. Each place is explained and presented in plan form, with additional supporting visualisations to communicate intentions related to appearance and character.

The third section presents the more detailed design intent for the campus environment. This illustrates how the design of the main places is to be realised in terms of materials and treatments, furniture and lighting. Through the use of a simple, consistent and robust palette of materials, the individual places will be drawn together to create a cohesive and legible campus environment. The Masterplan submission described the ambition for a landmark healthcare campus with a strong identity and an enduring legacy. This section describes how this is to be achieved.

It is intended that the design will support two strands of identity for the campus. The first is the high level brand and identity for the new campus as a whole, based upon the landmark character of the new hospitals. The second strand is the finer grain of identity which is to be created for each of the identifiable places within the campus  an aid to legibility.

## Ongoing Design Activity

An outline strategy for signage within the campus has been included and more detailed design development related to the design and appearance of the coordinated suite of signs is to be undertaken as the design is developed.

A number of elements which will form part of the final scheme are being developed by the project team, in response to the consent which has been secured for the Masterplan. This landmark within the process has enabled certain intentions to be fixed as a platform for more detailed consideration. Some components have not been sufficiently developed at this point to support a detailed application. This reflects the complex and multi-faceted nature of the design process for a complex hospital environment. An example related to the external environment is the design of the courtyards within the footprint of the hospital. The design concept for these areas has been established, but resolution of the design at a more detailed level in each space will require further collaboration within the team and resolution of clinical programming and functions for adjacent room types at each level of the building.

A number of additional elements have been included as supporting appendices to reinforce the submission. These include management and maintenance proposals, plus the campus-wide strategy for pedestrian movements and facilities for cycling.

## 2.1
## Outline Planning Consent

In April 2007 the Board lodged an outline planning application with Glasgow City Council which was accompanied by an Environmental Statement. The planning application and ES were the subject of consultation with an extensive range of statutory and non statutory bodies, agencies and the general public. The application was reported to the Council's Development and Regeneration (Development Applications) Sub Committee in January 2008, with a recommendation for approval. The Sub Committee voted to grant outline planning permission subject to 43 planning conditions and the signing of a Section 75 Agreement. The outline planning consent for the New South Glasgow Hospitals project was issued by Glasgow City Council on 30 July 2009.

The consent states that subsequent planning approvals will be dealt with as 'Reserved Matters'. This two-stage approach means that there will be a requirement for reserved matters applications to be scrutinised by the planning authority to determine whether further environmental information and assessment is required to allow the detailed consideration and determination of reserved matters.

The proposed Condition No. 2 of the Outline Planning Consent states that:

Approval of the details of the siting, design and external appearance of the building(s), the means of access thereto and the landscaping of the site (hereinafter called the reserved matters) shall be obtained in writing from the Planning Authority prior to the start of any work on site. All reserved matters to be submitted for approval within three years of the date of this permission.

Reason: In compliance with Section 59 of the Town and Country Planning (Scotland) Act 1997.

With the implementation of the Development Management component of the Planning Etc. (Scotland) Act 2006 on the 3 August 2009, the submission of 'reserved matters' applications was replaced by the submission of 'Matters specified in Conditions' applications.

## 2.2
## Masterplan Consent

In April 2010, a Matters Specified in Conditions (MSC) application (Ref: 10/00945/DC) was submitted to Glasgow City Council to audit the changes between the indicative campus masterplan and the finalised masterplan, and assess the extent to which the finalised masterplan accords with the ES, as required by Condition No.1 of the Outline Planning Permission. The application outlined the following information.

- Setting the scene
- Strategic Context
- 2007 Campus Development Plan
- 2009 Campus Masterplan
- 2010 Masterplan
- Site Context
- Design Vision
- Masterplan Layout
- Landscape Framework
- Elements of the Masterplan
- 2010 Masterplan Strategies
- Transportation
- Site Circulation
- Landscape
- Drainage
- Arts and Healthy Environment
- Sustainability

The MSC application was approved by Glasgow City Council on 24 June 2010, subject to six conditions addressing issues including waste management, surface water, residential amenity, and wind turbines.

This Document represents the next stage in the planning process and is accompanied by a set of drawings which complete the submission

2007 Campus Masterplan

Existing Site. River Clyde to the North

# 3.0
# 2010 Campus Masterplan

## 3.1
## Introduction

The 2010 Campus Masterplan updated the previous stages of the development process for the campus. The Masterplan document explained the extension of the proposal and the rationale for the design intent. It also explains the fictional characteristics of the site and made clear the relationship between the retained estate and the new buildings. This document is part of the planning process and follows a logical design sequence. This document should be read in conjunction with the 2010 Campus Masterplan and an understanding of this earlier document is required to complete the picture

## 3.2
## City Context

The New South Glasgow Hospitals project is located on the existing 28 hectare Southern General Hospital site, situated on the south side of the River Clyde in the Govan district of Glasgow. The surrounding land uses consist of a mixture of residential to the south and east, industrial and business to the west, hi-tech industry to the north and the Shieldhall Wastewater Treatment Works to the northwest. The area is suburban in character. The local environment is low in quality and most of the built form is industrial in design and poor quality in terms of fabric and finished materials.

The existing hospital site dates from 1872. Further expansion commenced in the 1900s and 1950s, followed by the Maternity Unit in 1970 and the Institute of Neurological Sciences in 1972. Additions in the last 5 years have included the Department of Medicine for the Elderly, the Westmarc building, extensions to both biochemistry and pathology buildings, and the recently commissioned Neonatal Unit.

## 3.3
# Masterplan Principles and Design Development

### Design Vision

This section reaffirms the vision for the New South Glasgow Hospitals Project based upon design work by the appointed contractor and design team. The vision is based upon the creation of a landmark healthcare campus environment with emphasis upon a green character as an influential setting for state of the art hospital facilities. It is intended that the design of the external environment should be an appropriate response to the scale, significance and profile of the project.

The setting of the new buildings within a designed sequence of public spaces is intended to de-institutionalise the hospital environment as far as possible and to create an engaging environment with a variety of designed external spaces. The structure of the campus has been defined in response to function, clarity and ease of access and circulation. The 2010 Campus Masterplan has sought to make the best possible use of the site and the opportunities presented by the scale of the campus redevelopment. The design includes an arrival space which functions as a transport hub, an enhanced central park, a further Children's park dedicated to the new Children's hospital and a new entrance boulevard.

These primary spaces are complemented with additional primarily functional areas associated with Accident and Emergency and the creation of clear and direct routes for emergency vehicles. Different entrances and exits are located around the base of the podium to respond to the complex internal layout of the building. Simple functional access points will be clearly identifiable for visitors and patients.

The clear external way-finding continues within the buildings and the setting of entrances and buildings has been defined to optimise orientation and create an identifiable entrance area for the new public buildings. It is intended that the hospital buildings will be set within a green environment which is scaled in response to those buildings and to provide an extensive and influential green carpet. In this way other site buildings will also benefit from the enhanced green setting. Clear links to surrounding areas are proposed for pedestrians and cyclists and routes will be provided to create links through the large campus site. The Masterplan is intended to create a lasting green legacy for the site and the surrounding communities.

### Key Objectives:

- Maintaining the current and future operation of the site
- Intuitive way-finding throughout the site
- The creation of an approachable and compelling green healthcare campus
- A landmark design of appropriate quality
- The creation of a lasting legacy for Govan and Glasgow

### Design for the Future

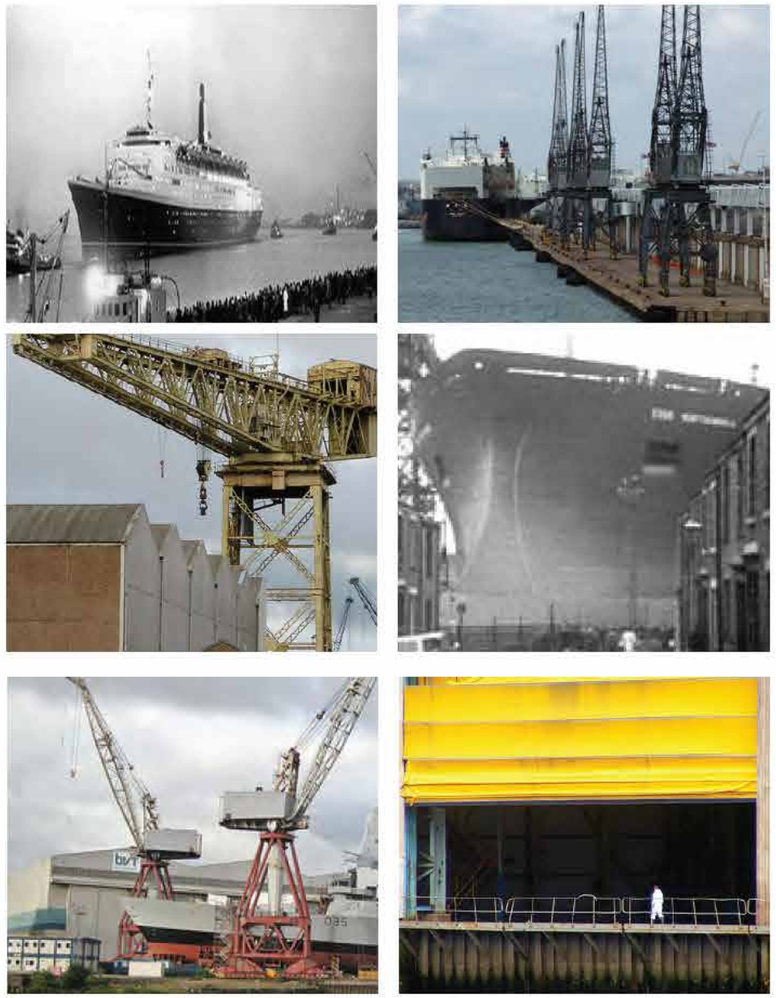
The design approach for the project has taken account of the location, the site context and the rich heritage of the River Clyde corridor. A creative response to this heritage has informed aspects of the design concept for the Masterplan and the buildings and it is intended that a creative approach to the healthcare environment is embedded within the ongoing design process. This is to be achieved through the extensive public art strategy, the activity of the Board's healthy living and environment teams and the creative response of the design team. Whilst heritage is an important point of reference, this project is of regional significance and is to be forward-looking to create a powerful legacy and regional landmark.

### Design Concept

At this stage, simple ship-building references have been used to describe some of the characteristics of the building forms and the functional characteristics of the masterplan scheme. The project is large and complex and a simplified conceptual approach to exploring the forms and their relationships can assist in explaining the design. The design concept is also useful as a means of exploring the intended character and 'personality' of important parts of the project.

The ship-building concept applies to the conceptual form and character of the new hospital buildings, which have been defined as a Dock (the broad podium), a Landmark Beacon (the ward tower located on the podium) and a vessel anchored alongside the dock (the Children's hospital). This captures the coming together of the primary components of the new hospital buildings and bridge links to maternity and neurosciences are referred to as anchor points for the new hospital buildings to connect appropriately with the existing site.

The Masterplan has been refined to enhance the intuitive way-finding and make clear the location of entrances and important destinations. The arrival square at the heart of the new green campus has been explored in simple functional terms as a dock edge where people are delivered by a variety of means (buses seen conceptually as ships coming and going). Visitors, staff and patients then move along a linear dock edge towards their destinations, which are positioned to relate to the layout of the dock.

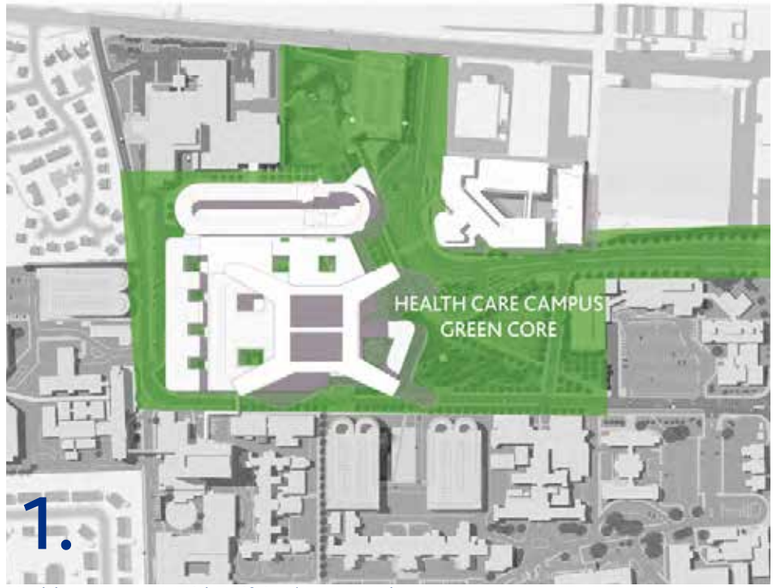


The Clyde corridor has a rich industrial heritage of large structures and big buildings

## Spatial Character

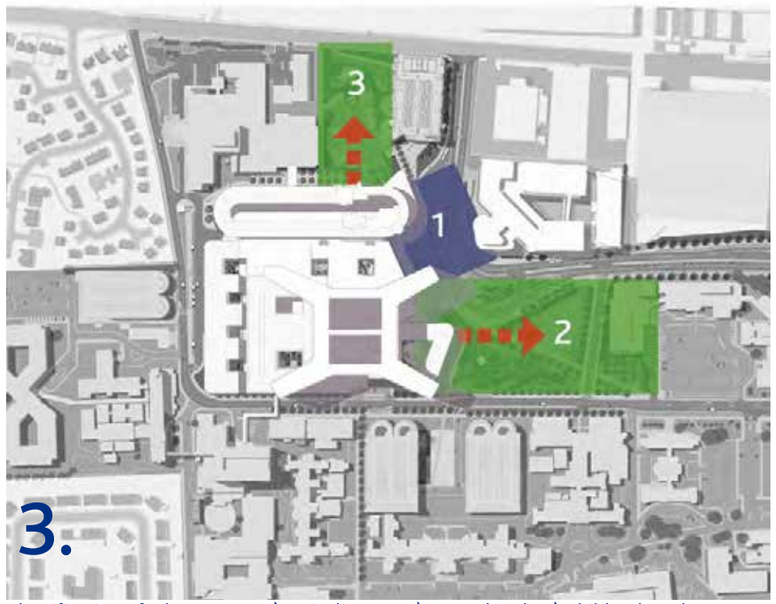
The following diagrams identify the key spatial concepts for the masterplan, which are then subdivided into smaller character areas responding to their immediate context whilst not losing sight of the over arching principle - that of the campus being essentially green at its core. The campus landscape functions to stitch the new and old architecture together through a consistent approach to the design language.

The process of establishing a hierarchy of spaces identifies an opportunity to link the 3 key spaces through the Arrival Space.



Healthcare campus with unifying 'green core'

Clear distinction between children's and adults/acute hospitals helps to inform adjacent landscape character



Identification of 3 key spaces: 1) Arrival Space 2) Central Park 3) Children's Park
The parks have direct connection to the respective buildings they serve

Establish connection between the two parks through the Arrival Space

# 4.0
# MSC - Landscape & Public Realm
## 4.1
## Matters specified in condition

The grant of outline planning permission for the New South Glasgow Hospitals project was issued by Glasgow City Council on 30 July 2009 (Ref: 07/01158/DC). In terms of landscape issues, the outline consent was granted subject to the six conditions which are listed below. These planning conditions form part of a comprehensive 'Matters Specified in Conditions' application lodged with Glasgow City Council in mid July 2010 for consideration and determination by autumn 2010 prior to the lodging of the Final Business Case with NHS – Greater Glasgow and Clyde.

### No. 2 Site Design, External Appearance and Landscaping

Approval of the details of the siting, design and external appearance of the building(s), the means of access thereto and the landscaping of the site (hereinafter called the reserved matters) shall be obtained in writing from the Planning Authority prior to the start of any work on site. All reserved matters to be submitted for approval within three years of the date of this permission.

Reason: In compliance with Section 59 of the Town and Country Planning (Scotland) Act 1997.

### No. 5 Tree Survey and Arboricultural Report

A detailed tree survey and arboricultural report shall be submitted a part of the landscape framework required under condition 3. This should show the exact location of all existing trees on site including a note of height, species, base level and extent of canopy or branch spread. The plan should indicate those trees it is proposed to retain and those which the applicant intends to remove. No trees on the site shall be lopped, topped, felled or removed without the prior written approval of the Planning Authority. Any tree removed under the terms of the written approval shall be replaced by a tree of similar species and appropriate size at the locus.

Reasons: (1) The site is currently the subject of Tree Preservation Order (TP0) GDC 052 1995 affecting those trees listed in its schedule protection under the Town and Country Planning (Scotland) Act 1997. (2) The tree cover on the site currently provides and contributes to wildlife habitat provision, visual amenity and diversity along with screening to external traffic.

### No. 8 Tree Protection Method

All retained trees on site shall be protected by a satisfactory method to be agreed in writing with the Planning Authority before any work commences on site. The agreed method of protection (as set out in BS5837/2005) shall be maintained on site until completion of all works in the vicinity of the trees.

Reasons: (1) To enable the Planning Authority to consider this/these aspect(s) in detail.
(2) In order to protect the trees on site and visual amenity of the surrounding area.

### No. 26 Pedestrian and Cycle Routes

A network of internal pedestrian and cycle routes shall be formed within the site to link the new hospital buildings with existing buildings, public transport hub and external pedestrians and cycle routes. Detailed proposals of these proposed pedestrian and cycle routes shall be submitted to the Planning Authority for approval.

Reasons: (1) In the interest of traffic safety at the locus and to ensure satisfactory traffic circulation within the site. (2) In the interests of pedestrian safety.

### No. 28 Cycle Parking Provision

Appropriate levels of safe, secure and sheltered cycle parking shall be provided for staff and visitors in accordance with Policy TRANS 6 of the Glasgow City Plan. The cycle parking shall be evenly distributed around the site, serving all new buildings within the site and suitably linked to internal and external cycle routes. Appropriate shower and changing / locker facilities should be provided for staff cycling to work.

Reasons: (1) In the interest of traffic safety and to safeguard the amenity of the surrounding area. (2) To enable the Planning Authority to consider this/these aspect(s) in detail.

No. 38 Landscape Framework and Management Plan Compliance with Advice Note 3

The 'detailed landscape framework and management plan' required under the provisions of condition 3 above must comply with Advice Note 3 'Potential Bird Hazards from Amenity Landscaping and Building Design'; (available at www.caa.co.uk/srg/aerodrome) unless otherwise agreed in writing by the Planning Authority. These details shall include:
(i) grassed areas,
(ii) the species, number and spacing of trees and shrubs and
(iii) details of any water features.

Reason: To avoid endangering the safe movement of aircraft and the operation of Glasgow Airport through the attraction of birds and an increase in the bird hazard risk of the application site.

4.2

## Ongoing design development and phased packages to follow

The detailed landscape drawings for the internal courtyards for the Adult Hospital are in preparation and will be submitted to Glasgow City Council when complete. In addition, the following planning conditions attached to the outline planning consent will be purified by a subsequent MSC application in August 2010:

No. 20 Ground Contamination Assessment
No. 37 Proposed SUDS Scheme
No. 39 Surface Water Disposal
No. 24 Compliance with GCC Roads Standards

## 5.1
## Introduction

The consented 2010 Campus Masterplan described the general character and distribution of public spaces within the landscape and open space strategy for the site. This was based upon the development of an expansive green heart to the campus and a connected network of high quality spaces. The landscape framework illustrated the character and form of the various components of the campus design by reference to the types of landscapes to be created. This begins with a summary and update of the structure of the external environment. This section of the design statement now explains the design intent in greater detail and provides an overview of the design process for each discrete place within the structure of the landscape.

Illustrative Campus Aerial View

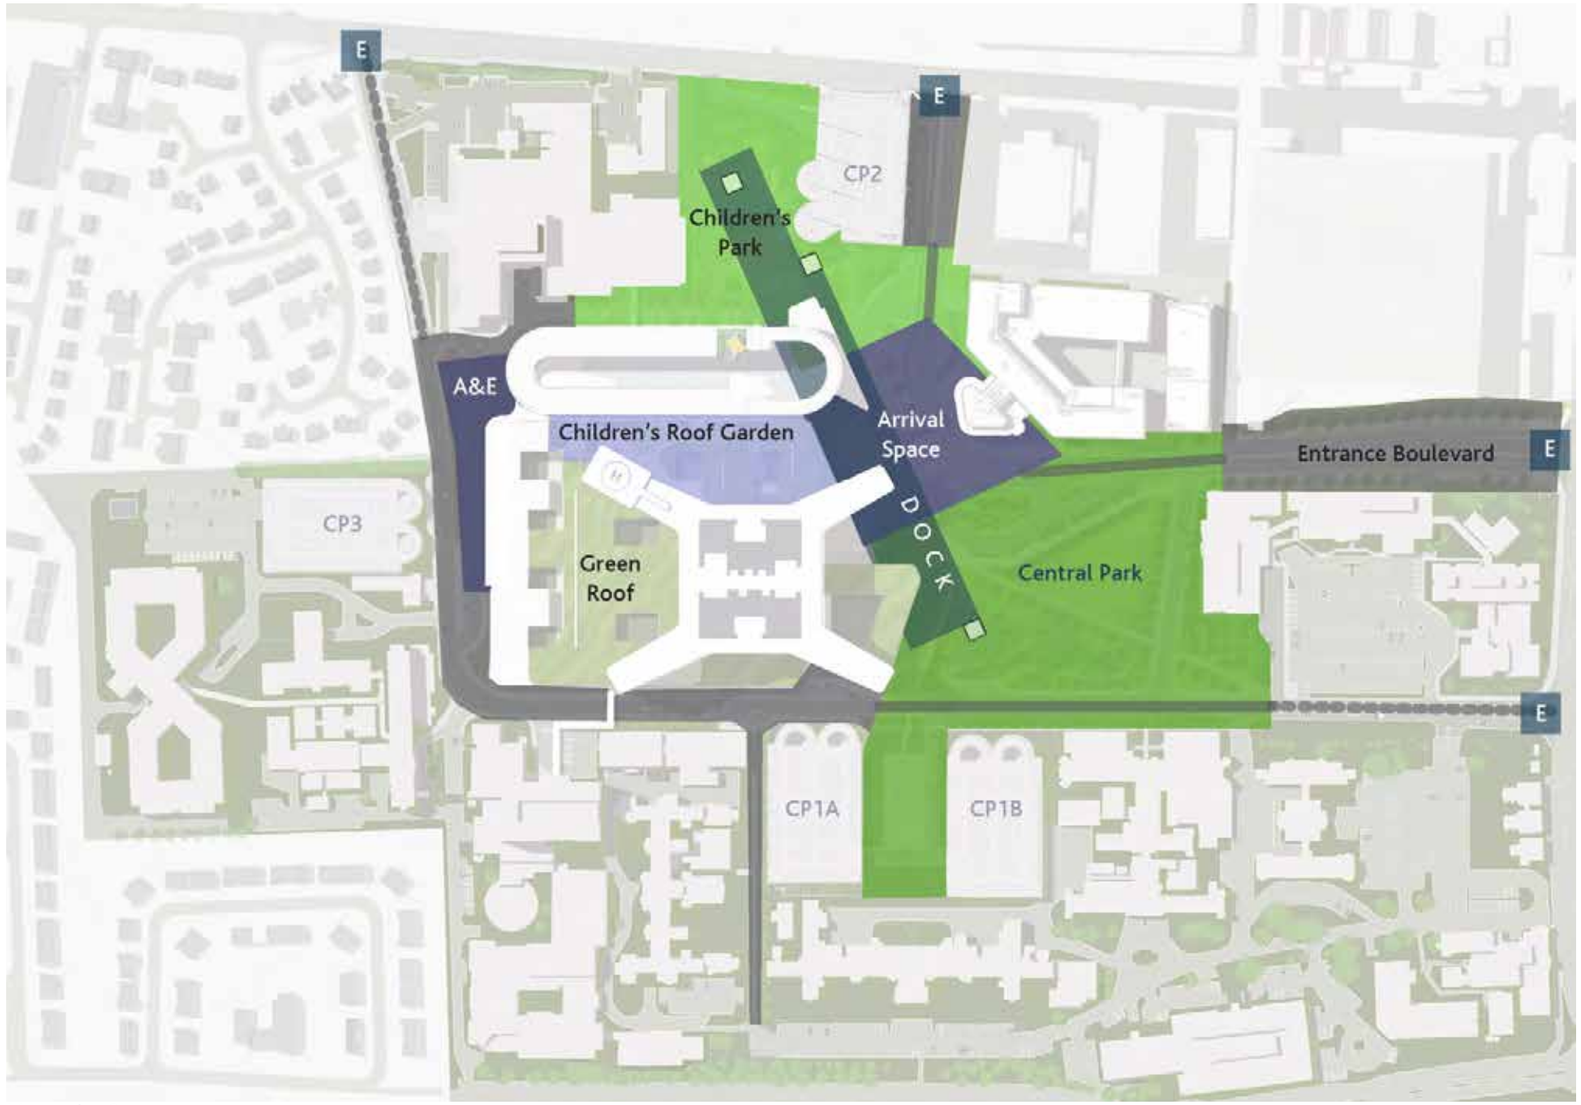
## 5.2
# Masterplan Structure

The layout of the new campus heart has been structured in response to the functional requirements of the hospital site. The hospital has three main entrances. The new entrance boulevard from Govan/Renfrew Road is aligned with the main entrance to the Acute Hospital. The layout has been arranged to aid way-finding and legibility through the placement of key destinations in visible locations. The main entrance is also visible from the Hardgate Road entrance to the site, on approach from the vehicular route and the pedestrian path from the main car park.

An arrival space has been defined to accommodate this main entrance and the entrance to the Children's Hospital. A public transport hub is located within this area to provide a high quality experience for bus users. The extent of the arrival space also encapsulates the entrance to the new laboratories building.

A separate blue light route for ambulances provides a second main route through the campus and this gives direct access to accident and emergency to the south of the building. This route is also used by buses within the campus and for access to the two eastern car parks which frame the listed clock tower and surgical block.

The network of vehicular routes within the campus has been defined in response to two key objectives. The first was to ensure the functional integrity of emergency routes from entry points and within the site. The second was to create a character which would not be dominated by vehicular movements around the extensive campus. Part of this second objective has included the creation of a green park-side setting for the hospital buildings, with direct pedestrian access to and from significant areas of park. This reflects the established intent to provide car parking within multi-storey car parks, thereby reducing the impact of car parking demands upon the layout of the campus.



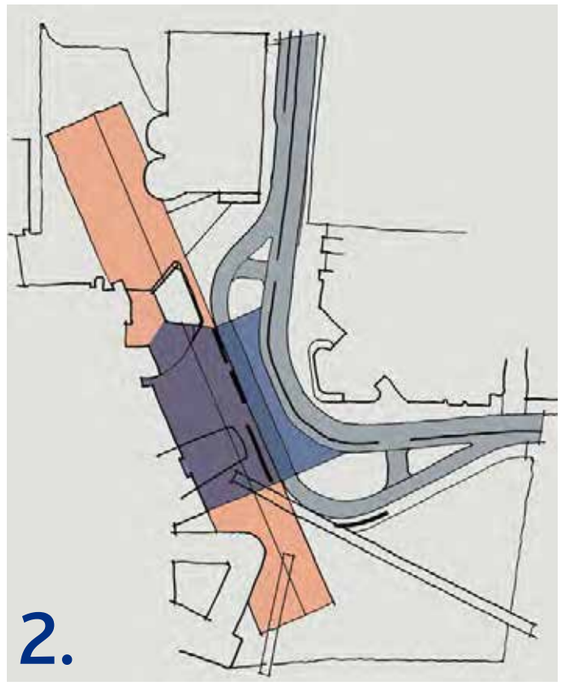
Masterplan Structure

A4993412285

## Dock Geometry

A link between the two parks through the arrival space was defined through realignment of the highway layout to create a meaningful relationship with the form of the hospital entrances. This strong rectilinear feature forms an organisational function within the design and function of the campus. The linear form resembles a dock edge - a passing reference to Glasgow's recent industrial past.

Road and Dock concept
Vehicles draw alongside dock
Movement along dock links hospitals and parks
Focus for desire lines



Road and dock geometry combined with arrival space as a legible focal point combining main entrances

Road and dock located within a broad green campus environment

Geometry retained within a refined park setting to define a sequence of character areas within a clear and identifiable hierarchy of public spaces

A4983422285

# 6.0
# Designed Places
## 6.1
## Arrival Space

### Structure

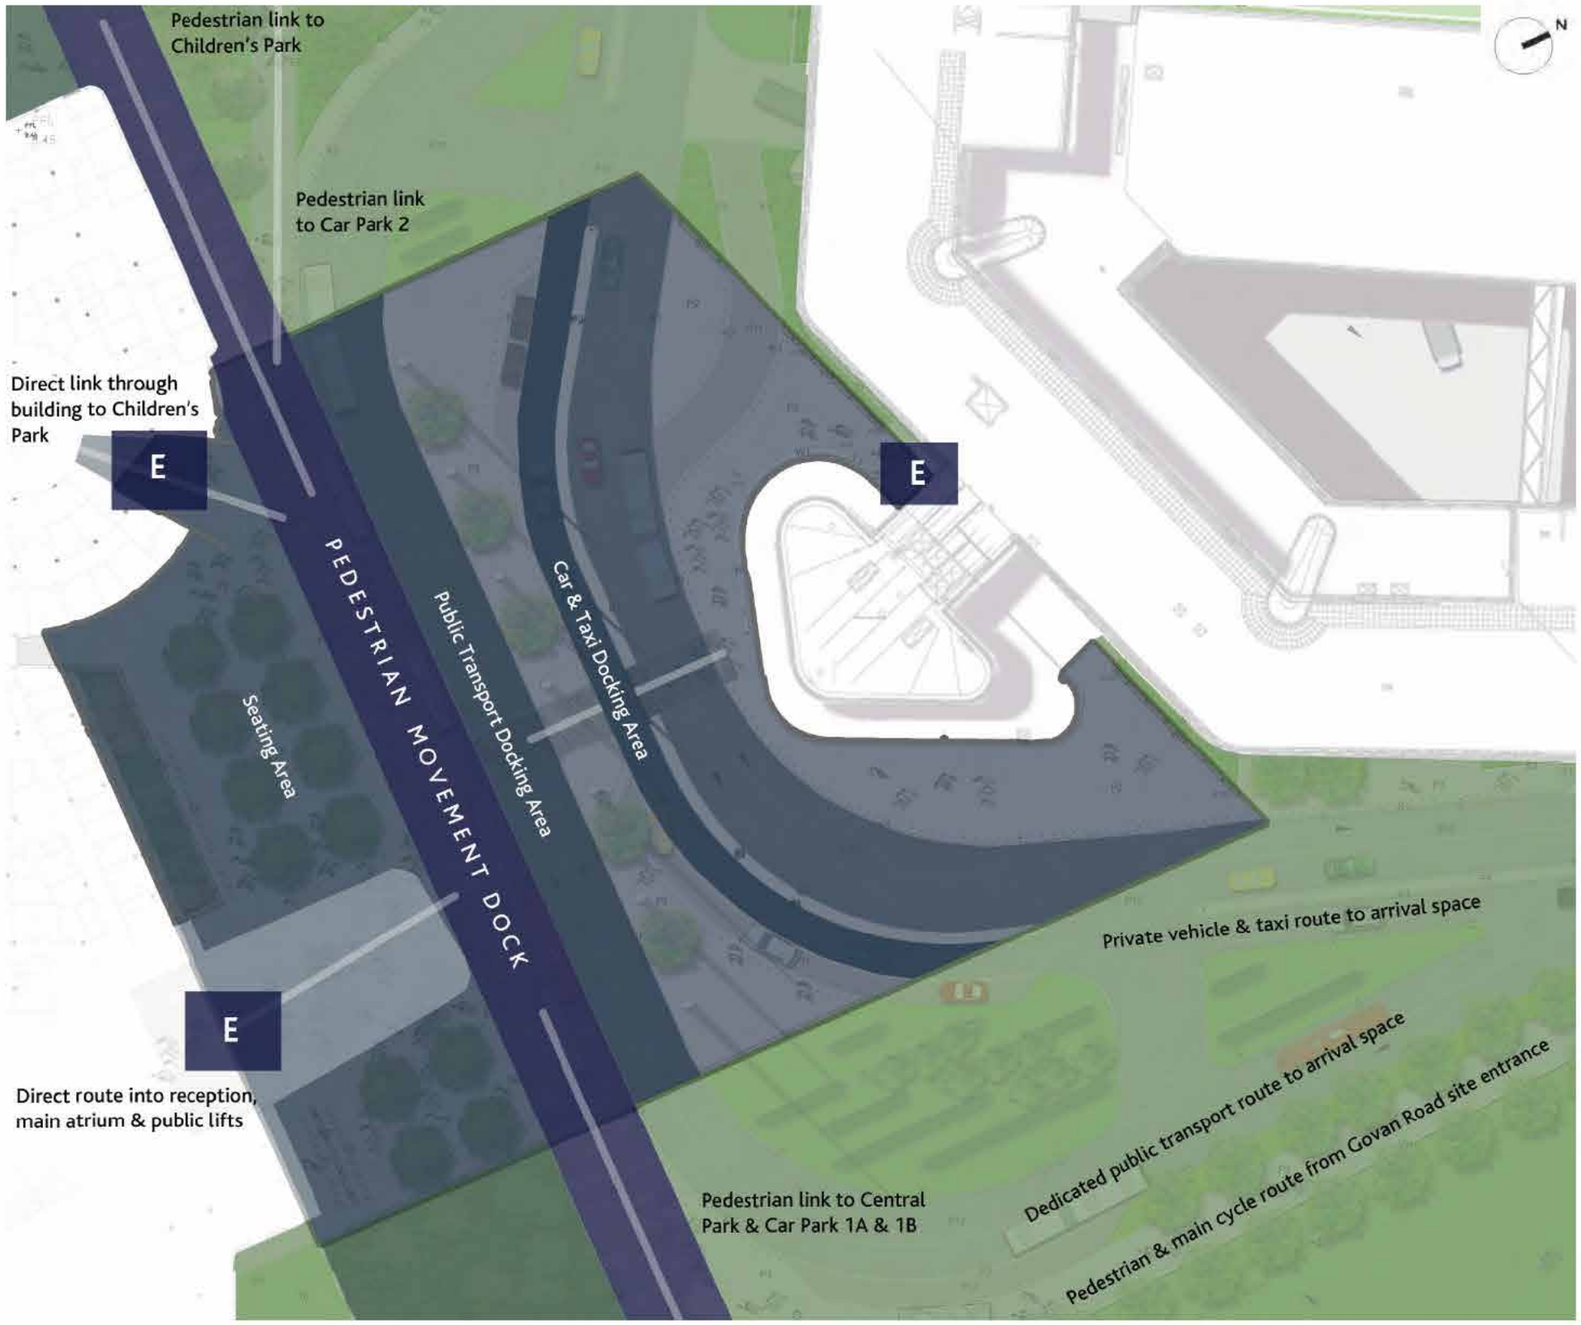
The arrival space has been defined by the arrangement of the built form around . The process of masterplanning the site was addressed collaboratively within the design team to establish purposeful relationships between the buildings and their setting. Built edges to the arrival space were placed to create an area of an appropriate scale for the significant functional demands placed upon this civic front door to the hospital. Building locations were defined in response to appropriate distances from roads to support pedestrian circulation. Entrances were located to make circulation and access as clear and logical as possible for hospital users.

The Acute and Children's Hospitals form the southern boundary to the arrival space, with the entrance areas overhanging to create shelter and clear points of entry. The northern edge is defined by the form of the new laboratories building and the east façade of car park 2 defines a more remote western edge. Open boundaries to the east and west are designed to connect the two parks and provide a clear structure which is reinforced by feature light columns. The threshold of the space is marked by a low wall with integrated lighting.

### Function

The arrival space is a functional point of arrival within the campus. The physical form is defined by the intention for this to serve as something of a 'welcome mat' for the primary buildings within the new campus heart. This is a destination for the majority of hospital staff and visitors, whether arriving by bus, car, bike or on foot. This is a high quality civic space with generous proportions related to the scale of the built surroundings.

The space is defined by a low informal seating wall with a sandstone capping to match the sandstone façade treatment of the acute hospital entrance. The wall is illuminated with a simple concealed LED strip light to provide a distinctive civic quality within the space by night. Feature light masts approximately 20 metres tall within the arrival space establish a scale, significance and personality for the space in response to the character and scale of the surrounding buildings.



Arrival Space Functional Plan

The functional arrival area has additional space for orientation, sitting and meeting. Mature standard trees are placed within a grid on both sides of the entrance to the Acute Hospital. The geometry of the space is defined in response to the main entrance and also reflects the general alignment of the River Clyde to the north of the site. The alignment of the main entrance is perpendicular to this and the public space extends into the building to lead visitors into the internal public atrium space. This organisational geometry is reflected in the structure of the roads within the space and a significant 'public dock' extends east and west, parallel with the linear geometry, to provide a link between the two parks.

The Public Dock is a significant designed element within the public realm of the hospital. This granite-paved feature makes informal reference to the industrial ship-building heritage of the Govan setting, but also performs a pivotal function for all pedestrian movements. This is the pedestrian arrival point from all directions and this generously proportioned space provides clear movement between entrances and access to the new laboratories building over the entrance road.

## Structures along the Dock

The pedestrian  Dock is a significant part of the organisational structure of the primary public spaces. It provides the link between the arrival space and the parks and connects with all the primary pedestrian and cycle routes. To support this function it contains a range of functional structures along its length, including seating and shelters. These have been designed in response to the character of the dock as a feature area and the interface with other public spaces.

Landmark pavilions are located at both ends of the Dock. To the east is a seating pavilion overlooking the reed beds and ecologically rich informal environment of the parkland swale. The integration of functional elements such as water management has enabled opportunities to be realised for the positive enhancement of the parkland environment as a valuable resource for the campus, providing an attractive setting and ecological variety.

To the west, the landmark takes the form of an elevated play stage and events pavilion within the heart of the children's park. It is intended that artist commissions will inform the design of the pavilion structures as part of the ongoing design development process and the embedded public art programming. An intermediate pavilion provides functional bike parking adjacent to the Car Park 2.

Illustrative Arrival Space aerial view

A4907412285

The Pedestrian Dock is the setting for shelters and waiting areas associated with Fastlink and bus services to the heart of the campus. The design of these structures will also be considered as part of the artist commissions to ensure that a coordinated design language and an appropriate palette of materials is delivered without visual clutter or physical obstructions.

Buses draw up alongside the Dock to deliver and collect their passengers and public transport access is prioritised over other vehicular modes. Private cars and taxis drop passengers adjacent to the dock and access to the entrances and parks is via a crossing which acts like a gangplank.

## 6.2
# Central Park

### Structure

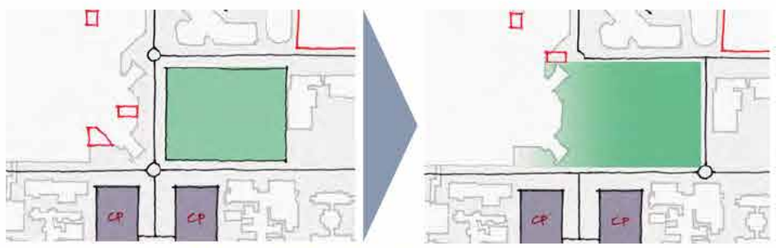
The Central Park has been designed as a new green heart to the campus. The influence of the green park character is intended to extend into other areas to create an extensive setting for the new project and set the tone for future developments. The new public park is intended as a valuable recreational opportunity for staff, hospital users and local residents.

The highway network within the campus has been defined to create a direct pedestrian link between the park and adult hospital. Roads have been pushed as far as possible from the centre of the park to create a critical mass of green space to deliver a park of appropriate scale. The park is bordered by the new boulevard and arrival space to the west and the blue light route through the site to the east. The northern edge is defined by the link road connecting the two, with the position of this having been set by the location of retained buildings (currently A&E) to the north

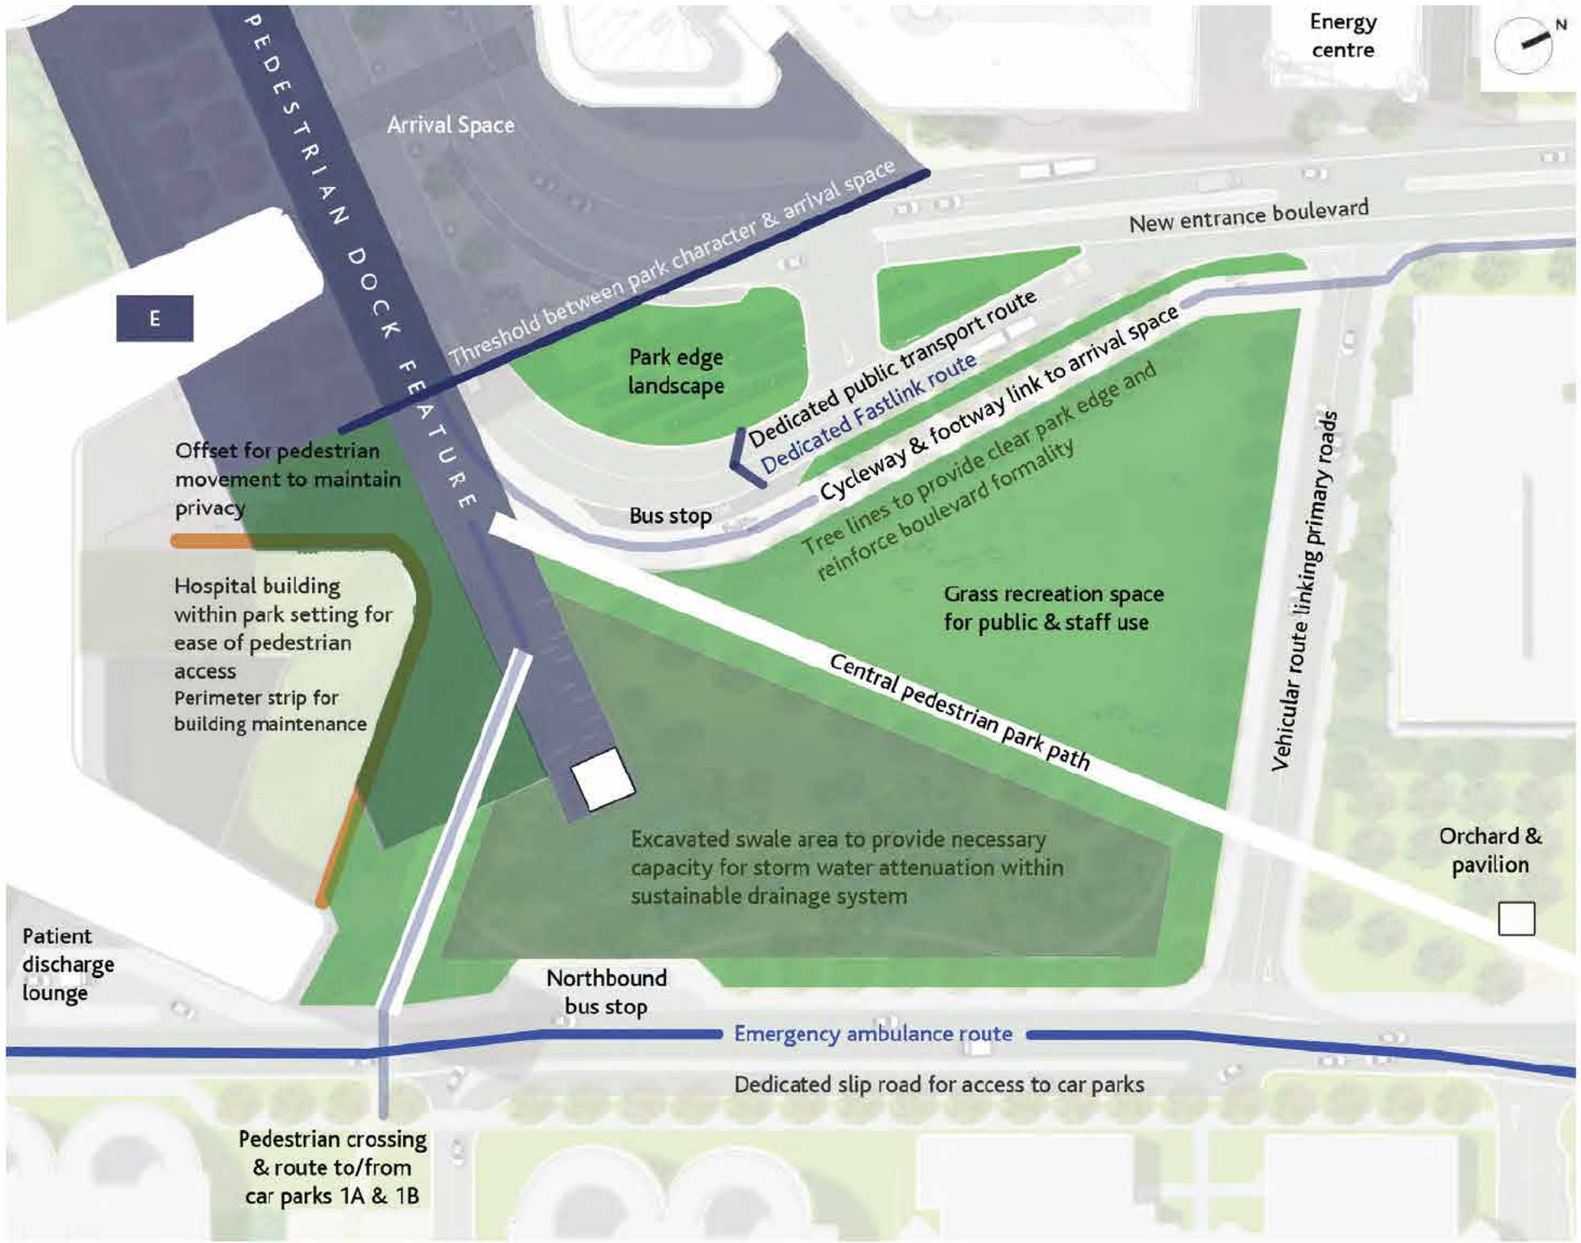
### Function

The park functions as a significant green setting for the new hospital buildings. The principal access routes also pass alongside or through the park to provide an informal and less institutional character for hospital approaches. There are numerous seating opportunities, including covered seating for contemplation. The park provides a useful contrast to the intensive and emotionally charged environment of a large hospital.

In addition to this 'humanising' function the park also forms part of the extensive water management network for the site, including storm water storage, flow attenuation and filtration. The park provides valuable ecological diversity and is intended to be a durable legacy for the future through the placement of new trees and durable materials.



Design concept sketch- hospital with park setting



Central Park Functional Plan

## Design

The design of the park is led by functional desire lines. These include the placement of a primary lit park route as a designed diagonal line to connect the entrances and arrival space to other approaches and northern and eastern areas of the campus. This clear route divides the park between the larger area of open and slightly undulating grassland from the eastern ecological swale area. The swale area is a designed and engineered depression within the park to accommodate storm water in extreme events and to manage the day to day treatment of rain water. The majority of the recessed area is therefore designed as a gentle grassed or planted slope.

The landmark pavilion the east end of the Dock has been located to provide a good view over this area. The sheltered pavilion commands and elevated position over the reed beds and a planted and terraced edge creates a characterful planted setting. The extension of the pedestrian Dock into the park is intended to encourage use and occupation of the park throughout the years.

The open grassed area also includes informal seating opportunities, which are intended to be provided in part by sandstone blocks reclaimed from existing buildings which will be demolished.

The Park edge is defined be lines of semi-mature standard tree to create visual containment and a strong identity for the park from surrounding roads. Trees are also used to aid the definition of the primary routes.

## 6.3
# Children's Park

### Structure

The establishment of the park was the result of modifications to the footprint and alignment of car park 2, which originally had a north to south alignment. Rotation of the car park through ninety degrees and an increased height provided the space for a park to be created as a focal point for the new Children's Hospital and to create a unifying setting for this and the existing maternity and neo-natal buildings.

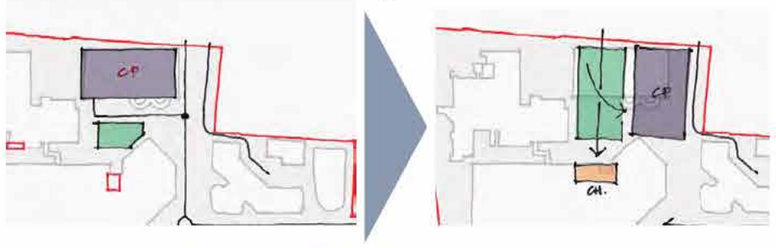
The form of the children's park is therefore defined by the built edges of the maternity building, the new hospital and the car park. The western edge is defined by the vehicular route into car park 2. The design of the new hospital building has responded to this opportunity to create a park-side façade with direct pedestrian access to the park and extensive views from within the building.

The park footprint is intended to be extensive and the character and quality of the green space extends to the surrounding areas and the threshold with the arrival space. The buildings define the park edges.

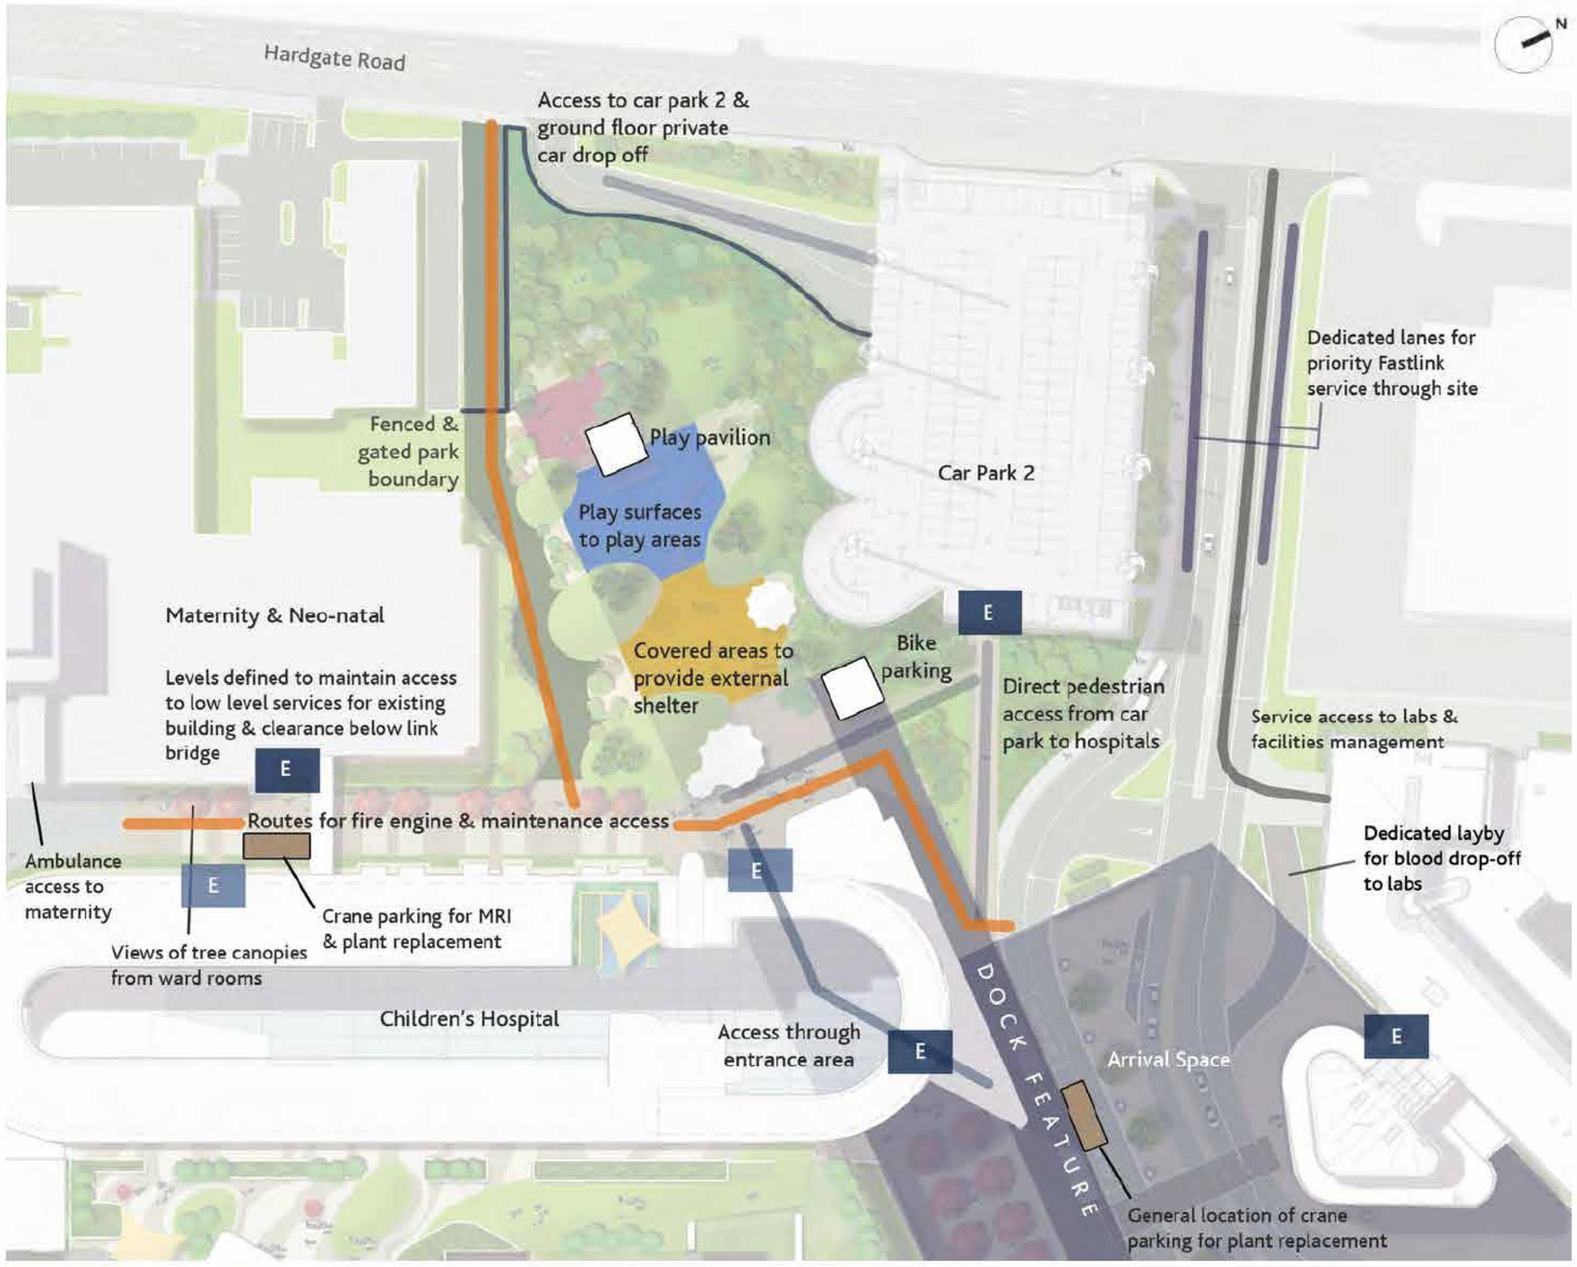
### Function

Through the co-location of hospital functions, the new park functions as an identifiable setting for services for families and children within the campus. This identifies the children's hospital as something more than a new building. The park provides a flexible open-air resource for staff, visitors and families and the play area can also be used by local residents. Covered seating areas are provided to make the space functional throughout the year.

The park provides seating, undulating landforms, play areas and new trees within a green planted character. The park provides an enhanced green setting for the new neo-natal building.



Design concept sketch-creation of Childrens Park



Children's Park Functional Plan

The functional demands upon the extensive park are defined by the operational requirements of the hospital. A vehicular route from the south through the park to the arrival space and also connecting with Hardgate Road provides access for fire engines, servicing and maintenance. Servicing requirements also include provision for plant replacement by crane (including generators from the elevated plant rooms of the children's hospital and MRI equipment from a temporary gantry beside the link bridge). General maintenance routes are also provided and access to existing buildings for servicing and emergencies is also maintained.

The western edge of the park is fenced to provide a secure environment for play and to prevent access by children onto the car park access road. A gate provides access for pedestrians and cyclists onto Hardgate Road as part of the permeable route network throughout the site.

## Design

The design of the park is intended to create an informal, attractive and playful environment with access for all. The hospital building has been designed in parallel with this to create a well grounded and friendly building as a contrast to the more stressful aspects of the hospital environment.

The park geometry relates to the pedestrian Dock rather than the grid of the internal hospital structure. The design includes undulating grassed mounds to create an engaging and playful landscape with interesting areas for exploration. A semi-natural wooded landscape is proposed along the facade of the car park, to create ecological and habitat diversity and to screen this structure with a green park edge. The green border creates a sense of enclosure within a substantial park setting.

Play surfaces provide a safe and colourful ground plane adjacent to accessible play structures and the landscape is intended to be a playful environment, with flexibility for future enhancement and changes in response to opportunities for alternative uses and features.

The levels fall slightly towards the west. An elevated covered play stage & pavilion is a central landmark feature for the park. This marks the western extent of the pedestrian dock and creates opportunities for imaginative play and outdoor events – including music, drama and other arts activity. This is intended as an external resource for the hospital, for staff and for events.

## 6.4
# Entrance Boulevard

The entrance boulevard sets up an appropriately scaled high quality approach to the new hospital building by its conscious orientation towards the main entrance tower, which is reinforced with lines of semi-mature tree planting. It is intended that this gateway character will create a significant campus entry feature.

The width of the boulevard has been designed to accommodate the required bus and car circulation. In addition a shared pedestrian/cycle path is provided on the east side of the boulevard (to connect directly with the main entrance) and a further footpath is provided on the west side to serve the labs building and energy centre. Lighting columns will be used to create an appropriately formed character for the route. Swales are also incorporated to treat water runoff from the road.

A4993412285

## 6.5
# Accident and Emergency

### Structure

Accident and Emergency is the second main façade to the hospital buildings. Direct access to accident and emergency is a clear priority for the effective function of the hospital. A&E has direct access along the existing spine road through the site. The effectiveness of this route has been enhanced through the creation of the new entrance boulevard, which – whilst providing a high quality approach route - will carry a proportion of the site traffic and direct this away from the blue light emergency route.

The blue light route has priority through the site and pedestrian crossings over this do not have raised tables, to ensure the smooth passage of emergency vehicles. Access to car parks 1A and 1B (to the east of the site) is via a dedicated slip road, which provides queuing capacity for cars. This ensures that delays associated with car park entry are unlikely to impact upon emergency vehicles.

The function of the A&E zone is supported by a large area of tarmac to enable ambulances and other vehicles to manoeuvre with ease and for stretchers to be wheeled over a smooth surface into A&E. A level change between this raised terrace and the adjacent road is achieved using a retaining wall against the footway at lower level.

A pavilion structure provides bike parking adjacent to the A&E entrances. This is to be designed as part of the consistent suite of external structures for the site. Car Park 3 provides parking adjacent to A&E for hospital visitors.

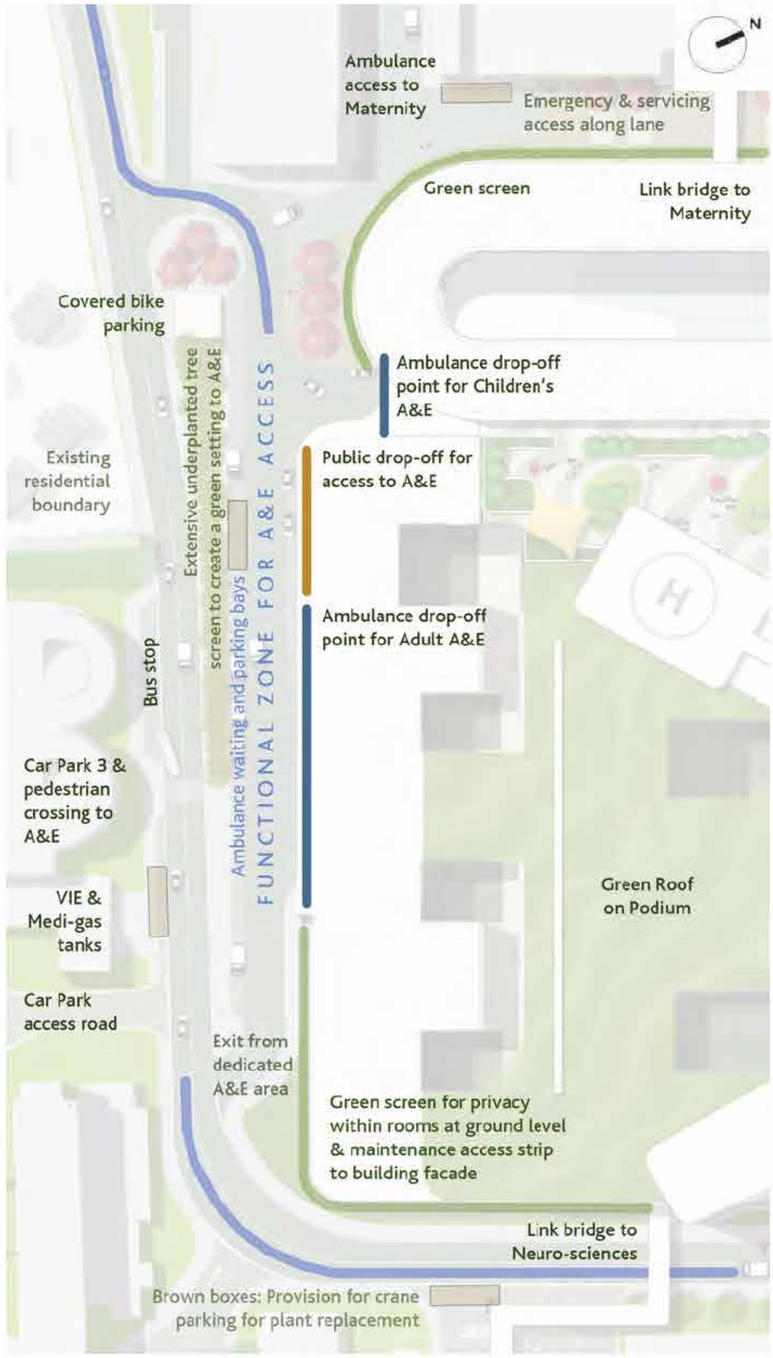
③ BIRCH TREE PLANTING SCREEN

④ RETAINING WALL

⑤ RETENTION OF EXISTING TRESS

⑥ VIE TANKS

⑦ PEDESTRIAN CROSSING



Accident And Emergency Functional Plan

Accident and Emergency Plan

## Design

The design of the A&E zone of the hospital externally is primarily functional, but this is also an area of considerable stress for hospital visitors. It is therefore intended that greening of the zone is achieved within the available space.

The tapering island between the blue light route and the ambulance bays is to be planted with a dense block of birch trees to create a visible block of planting on exit from the buildings and to create some effective green screening between A&E and the residential boundary. A planted perimeter around the southern corners of the new hospital buildings will provide an offset for pedestrians.

Illustrative Accident and Emergency Aerial View

Illustrative Accident and Emergency View

A4934212285

## 6.6
# Children's Roof Garden

The roof garden has been introduced in response to the opportunity to create a physical link between the upper level of the children's ward rooms within the hospital with the flat roof of the adjacent hospital podium. The result is an extensive outdoor garden environment for the children's hospital. This provides a significant extension to the hospital environment and a secure area for families, for play, for education and for relaxation and occupational therapy. The roof garden has been defined as a valuable part of the healing environment for the hospital and as an aid to treatment and recovery.

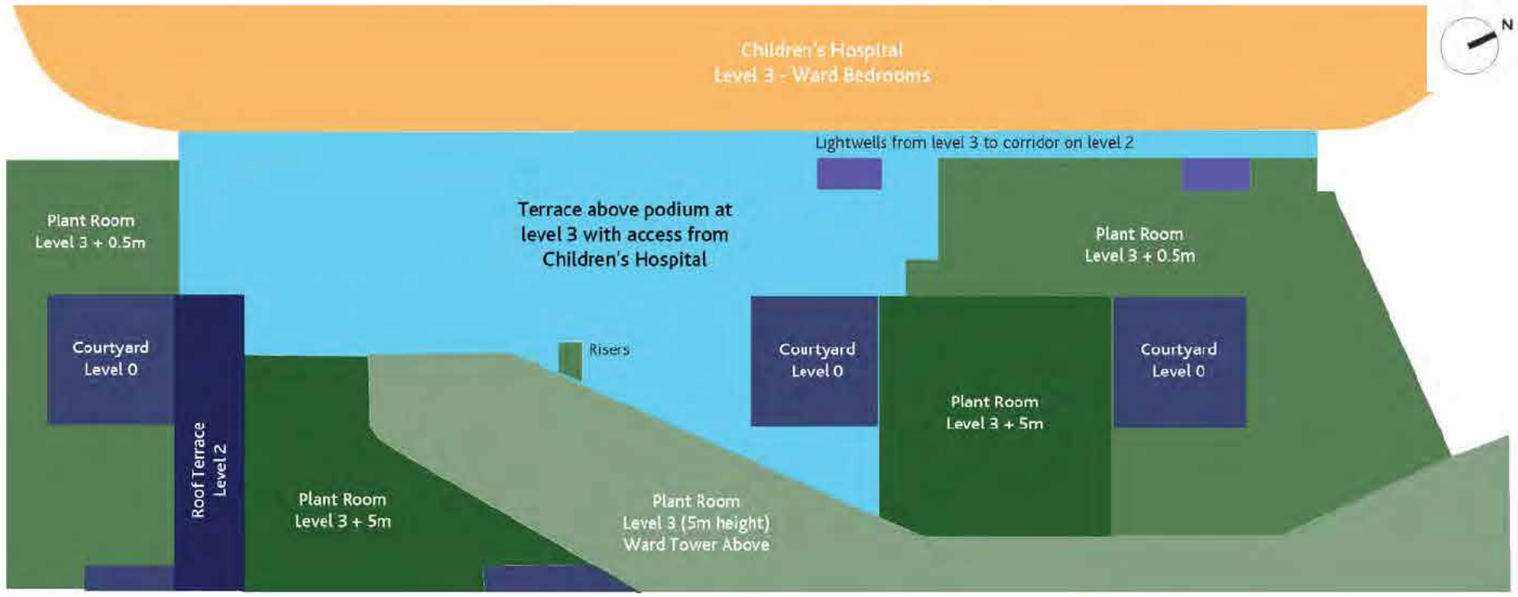
## Structure

The form of the garden is defined by the various components of the hospital buildings and the garden simply occupies the gap between the adult ward towers and the eastern edge of the children's hospital. Non-clinical plant rooms are located in and around this area and they have been screened or accommodated where possible to enhance the garden setting of this valuable space. The footprint of the roof garden includes a number of courtyard voids to provide light into areas of the podium levels below. A low planter runs along the western edge of the roof garden to provide an offset from windows for privacy and to give a clear access route between the three sets of access doors for maximum flexibility.

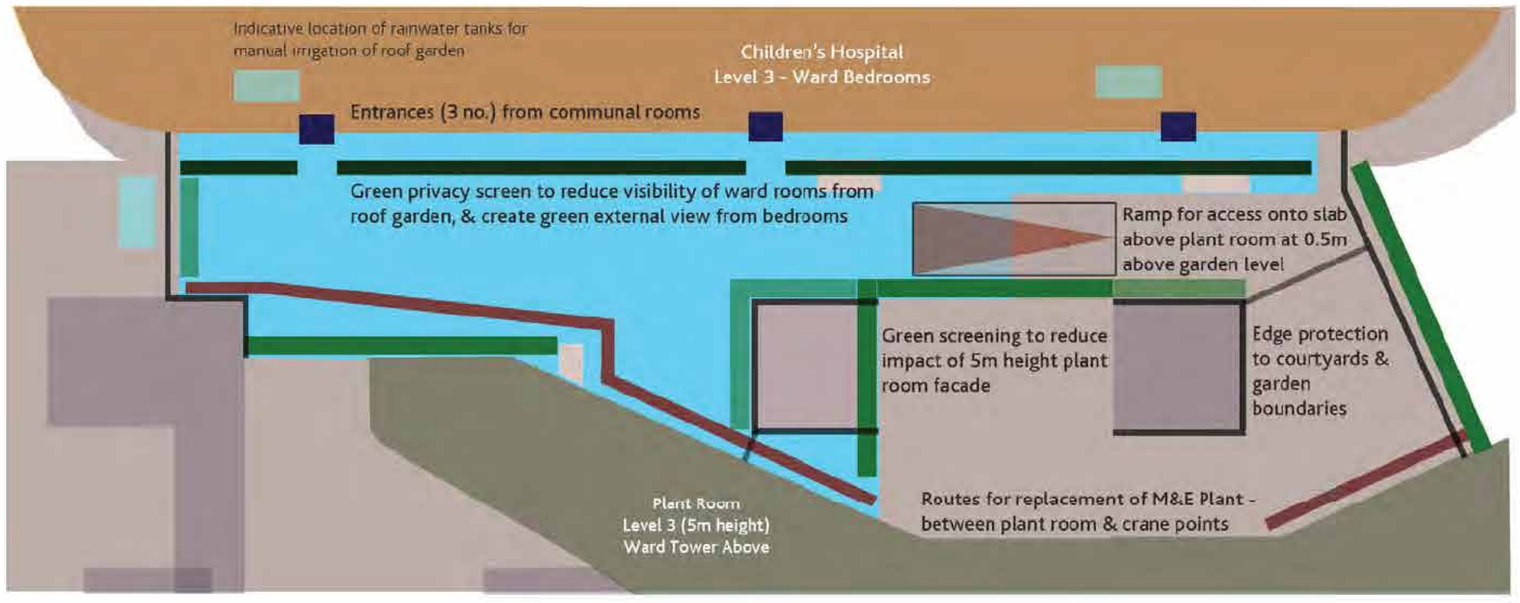
## Function

The roof garden is intended to provide a series of functional spaces which can be accessed by staff and patients from the upper ward floor of the children's hospital, including access for beds and wheelchairs. The more passive function of the garden is based upon providing views from windows facing towards the adult tower, and screening for views back in. Covered areas within the roof garden are intended to provide shelter from sun and rain, but also to provide a level of privacy for those using the gardens.

The plant rooms are a significant presence in this area of the hospital, providing mechanical and electrical services to clinical areas on the levels below. Access is required within the layout of the roof garden to transfer redundant or defective plant equipment from plant rooms to crane points for removal. These routes have been designed into the arrangement of the spaces.



Children's Roof Garden Structure Plan



Children's Roof Garden Function Plan

These plant rooms define the form of the structures surrounding the roof garden and also define the step in the ground plane towards the north. The step is addressed with a gentle slope to achieve the level change as a grassed area to extend the coverage of the roof garden to enhance flexibility and provide an area of informal meadow.

Screening has been proposed to reduce the visual impact of the more significant plant room facades, which are typically faced with louvres for ventilation. Edge protection is provided along all open edges and the height of this takes account of adjacent structures which could be climbed.

Taps are provided for maintenance and irrigation of the raised garden areas from rainwater tanks located within plant zones above the children's hospital. A maintenance compound is provided for the storage of necessary gardening equipment.

## Design

The design of the roof garden is divided between an area of grassland to the north and an area of play surfacing to the south. The active play area includes accessible grassed mounds with interactive play equipment and trees. The mounds are intended to provide a greater depth of topsoil to support trees and maintain healthy grass. The mounds create a contrast to the formal and regular built character of the hospital interior.

The perimeter of the southern end of the garden is defined with a variety of raised sensory gardens and growing areas which are intended to be planted and cultivated by patients, subject to opportunities, and to create a less institutional character for the hospital environment. External play space is seen as a significant benefit for many of the patients. These garden areas include pergola structures to define bays for use by families or to create quiet spaces.

The garden includes lighting to create a distinctive character for the roof garden by night and to enhance views for ward rooms and the communal socialisation spaces which are the location for the three access points.

## 6.7
# Courtyards & Roof Terraces

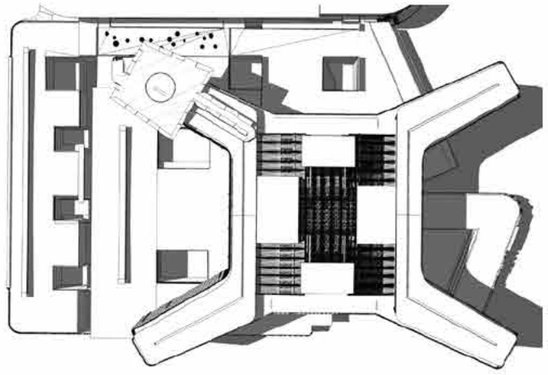
The podium level of the new hospital buildings includes a number of courtyards and light wells which have been located to enable natural light to penetrate the lower levels of the building. The podium provides a significant amount of accommodation and the deep form of the building combined with the height of the tower above significantly reduces the amount of direct sunlight at lower levels.

## Design

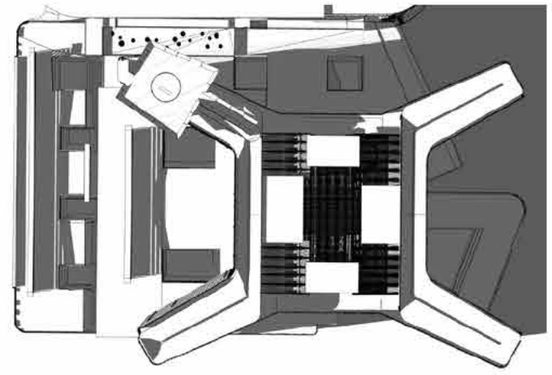
Design intent for the courtyards is based upon an offset irregular grid geometry which provides a deliberate contrast with the regular internal grid of the hospital. The grid for the courtyards is derived from the alignment of the pedestrian dock in the arrival space. The offset grid is proposed as the platform for the establishment of a variety of courtyard spaces which respond to opportunities presented by their scale, potential uses and potential for views and access. The access arrangements are intended to provide an appropriate amount of flexibility for future use.

The irregular nature of the grid is a mechanism for achieving the required maintenance access and window cleaning in relatively confined spaces, without maintenance and access ultimately defining the character of the courtyard.

The design of the courtyards on this basis is to be developed in response to the sign off for room types and adjacencies.



June (13:30)-some direct sun in summer months



December (13:30)- limited direct natural light into courtyards

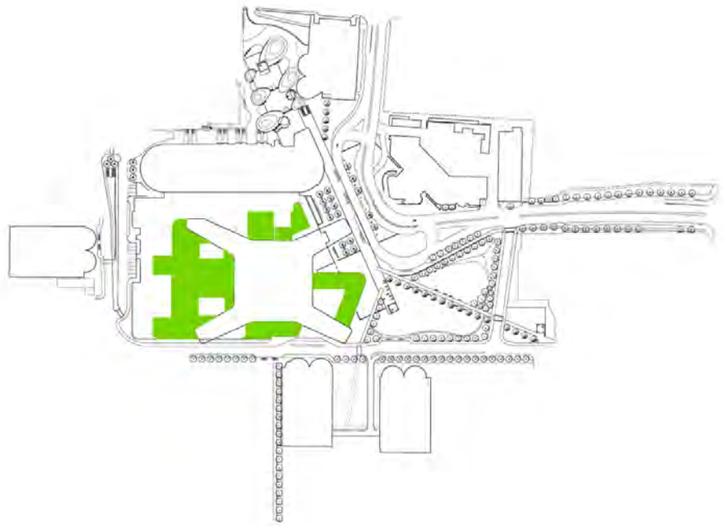
Concept sketches

## 6.8
# Green Roofs



A large area of the Adult's hospital is proposed an extensive green roof.

Green roof design is a rapidly developing technology, and many advances have been made with regards to species selection and provision of biodiversity within the low maintenance requirements of a green roof system.

The Adults hospital green roof will take full advantage of this latest thinking, and will be made up of approximately 70% plug planted sedum species and 30% plug planted perennials. In order to create a subtle roof pattern and to provide a greater number of habitats, the roof substrate depth will vary from approximately 80mm to 120mm. This enables sedum and perennial species to thrive. Opportunities to vary the substrate material will also be explored to provide further scope for roof pattern design.

Perennials suitable for inclusion with Sedum species (plug planted into substrate)

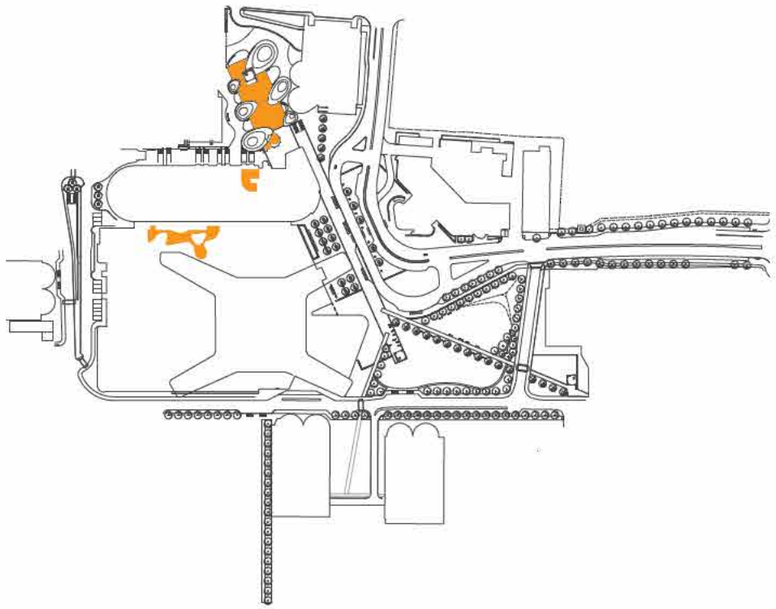
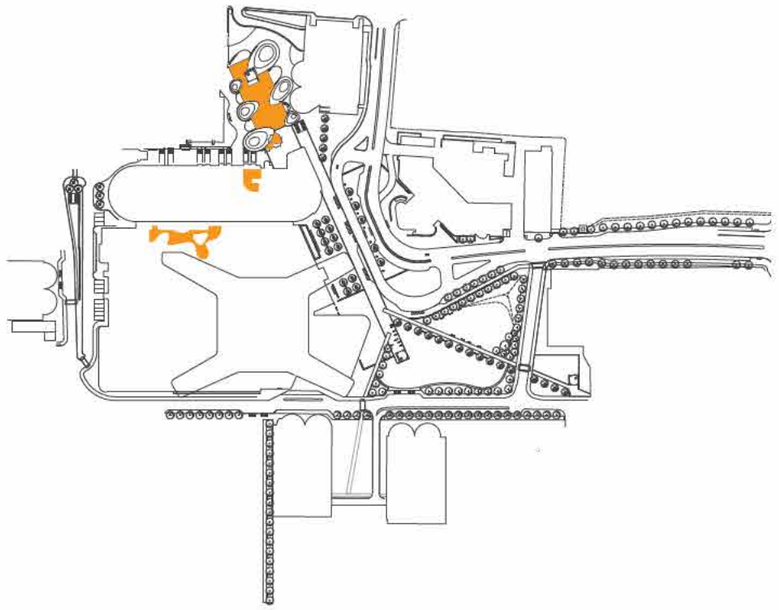
## Children's Park Play Equipment



Play equipment is placed primarily on the linear softplay surface and occasionally in the seating bays that flank the softplay surface (where they will be surrounded with bark chippings).

Equipment has been chosen to provide a range of play experience within a pirate ship/sea faring/discovery theme. Equipment is constructed from treated and durable wood.

Timber ship wreck



Bespoke Play
A bespoke play feature is proposed as park of the arts strategy to encourage children to interact. This will be developed further as part of the arts strategy, but might feature moving/sliding elements as illustrated.

Natural Play
As per best practise guidelines such as Play England's "Design for Play: A guide to creating successful play spaces", opportunities will be sought to introduce natural elements and elements of risk and challenge within play provision, which are appropriate to the needs of different age groups, while balancing safety and maintenance needs.
Locally sourced logs and boulders placed in the parks provide an opportunity for children to play in a more natural context, and encourage basic jumping, climbing and balancing skills.

Inclusive Play
Consultation has shown that the provision of wheelchair friendly play equipment is key to inclusive play park design, and is all the more important in the context of a new children's hospital play space.

Bespoke play feature

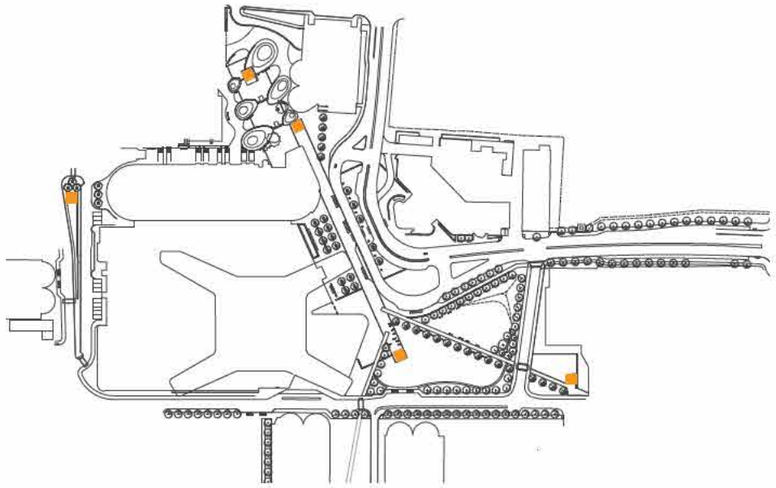
## 7.2
# Pavilions



### Shelter Structures

The pavilions are designed as 8 x 8m square modular structures. The solid and robust uprights are designed to portray strength and solidity -characteristics that are well suited to Glasgow's ship building legacy. The structure makes reference to the base of a crane, and could be constructed from cor10 steel to add a warm and timeless character. Each pavilion has a glazed roof with integrated lighting and drainage. Side panels are either glazed or made from perforated metal panels depending on intended function.  It is our intention that the pavilions will be further developed as part of the arts strategy -therefore illustrations shown in this report form the brief for further artistic interpretation. The artist will use lighting, glass manifestations, panel design and other techniques to add richness and fine detailing appropriate to the landscape setting for each of the pavilions.

There are three park pavilions: One at the eastern end of the dock feature that overlooks the central park, one situated on a raised timber stage in the children's park and a third located within the community orchard. All three pavilions provide shelter and seating. The children's park pavilion has a further function to provide a flexible performance space for role playing, story telling, music and other small scale family events.

There are 2 pavilions that are adapted to provide a secure location for cycle storage. These are located at the western end of the dock feature and by the A&E entrance. The side panels and door will be constructed from perforated metal panelling to provide extra security.

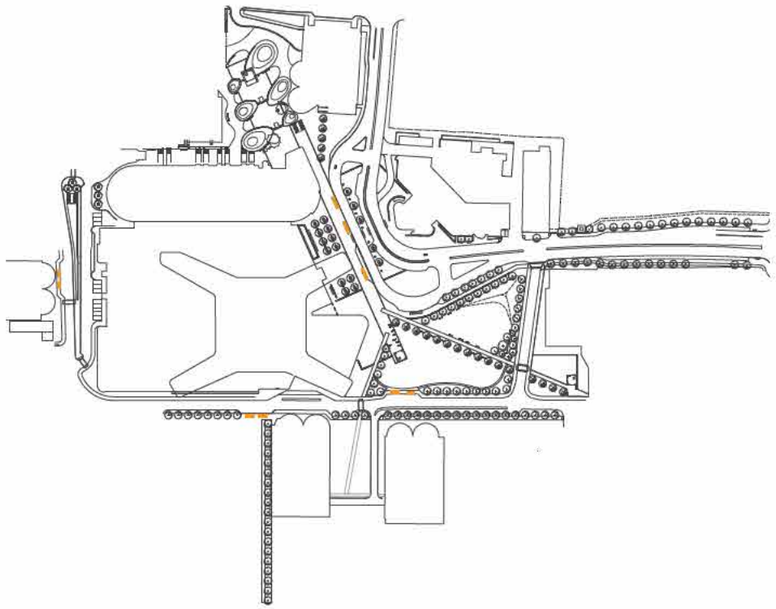
Illustrative Children's Park pavilion and stage from above

Illustrative Children's Park pavilion and stage showing back drop of park landscape

Illustrative Children's Park pavilion and stage aerial view

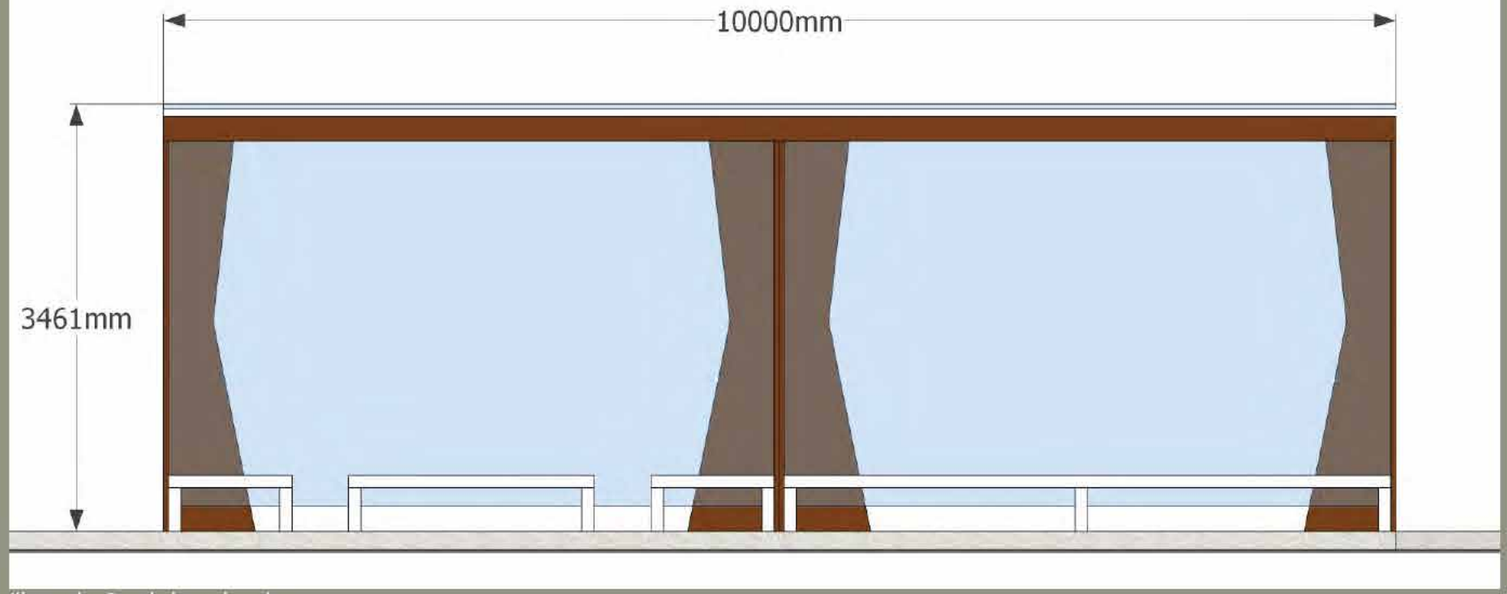
Illustrative Children's Park tensile shade structure

## 7.3
## Bus Shelters



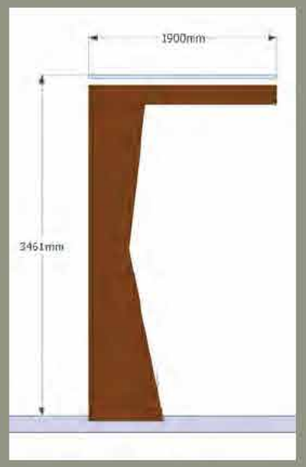
Bus shelters are illustrated to coordinate with the bold and simple industrial aesthetic of the pavilion structures. The tapered shelter supports provide a degree of side protection for the user and a glazed back ensures the shelter does not overly obstruct views of the main entrance. The shelter will include integrated lighting and drainage.

The shelter concept illustrated will be developed further as part of the arts strategy and in order to satisfy the requirements of Fastlink and GCC highways department.



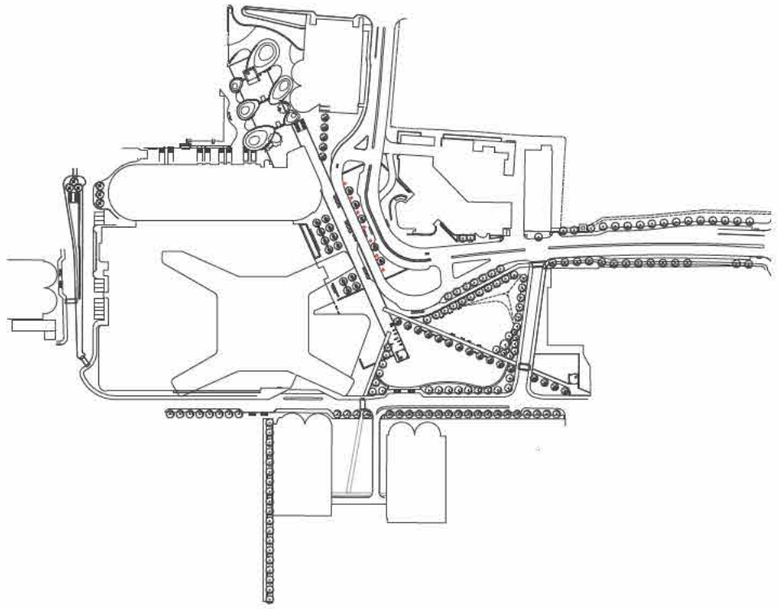
Illustrative Bus sheltter elevation

Illustrative Bus sheltter section

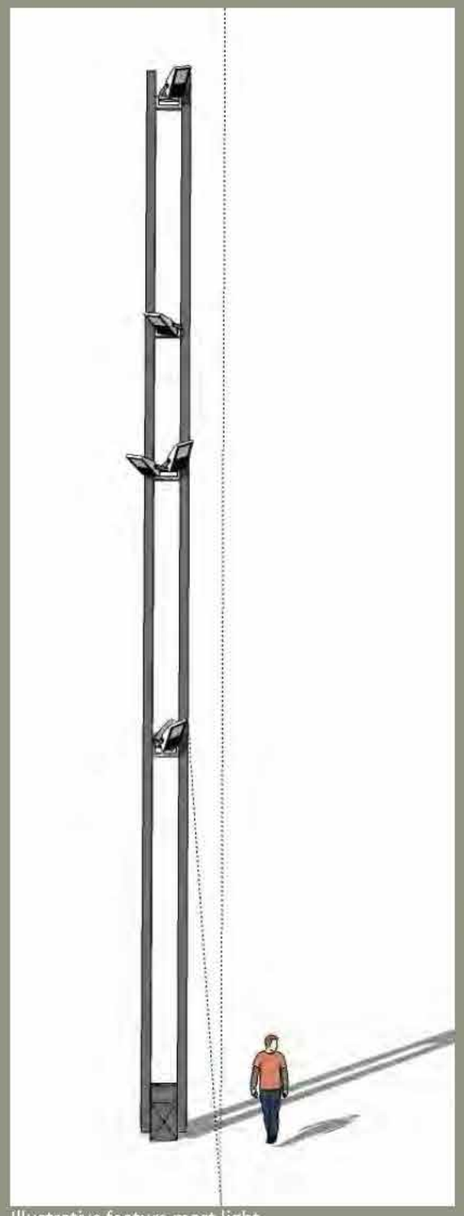


Illustrative Bus shelter perspective view

## 7.4
# Lighting masts



Bespoke 20m high steel lighting masts provide an iconic vertical statement in the arrival square. These will instil a sense of arrival and are sized to moderate between human scale and the 14 story Adults hospital. Design style again makes reference to industrial structures -in this case a steel girder form.  The rungs provide a series of heights from which to mount light fixtures necessary to illuminate the arrival space. The illustrated image is indicative of the scale and character envisioned.

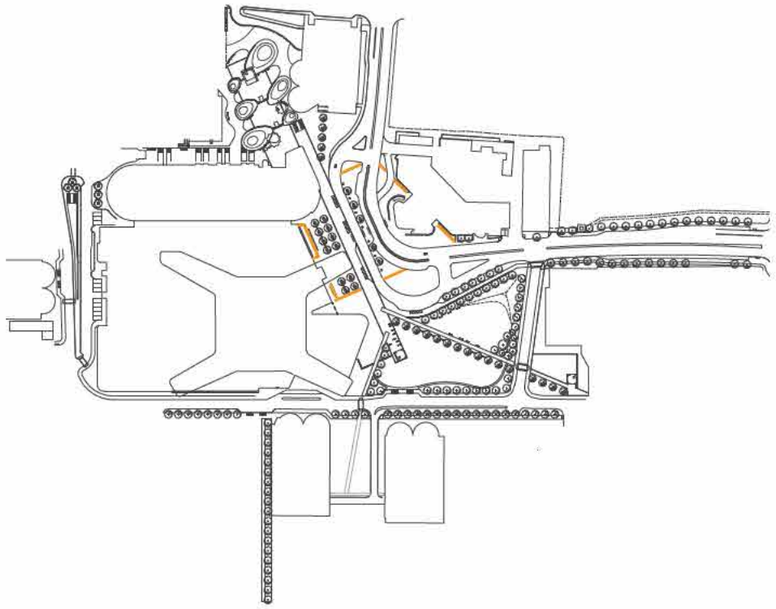


Illustrative feature mast light

Illustrative image of feature mast lights arranged along the Arrival Space central island

A4983422285

# 7.5
# Walls



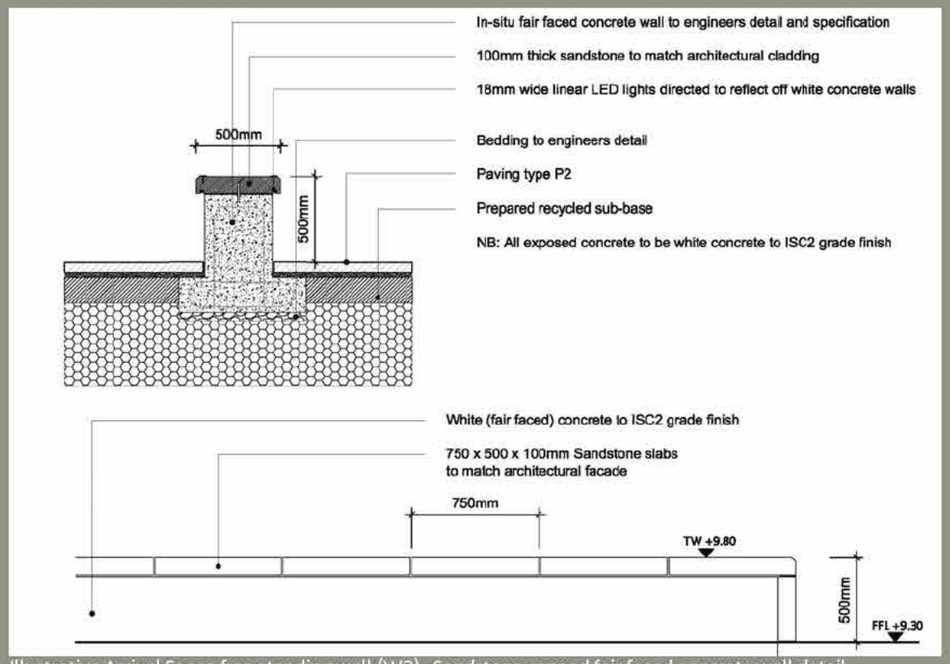
## General

Low walls are proposed in a number of locations to provide edge definition, lighting opportunities and to assist wayfinding. With the exception of wall type W3 (insitu wall not illustrated), they are all to be precast concrete with a white fair faced finish. The various configurations are described below.

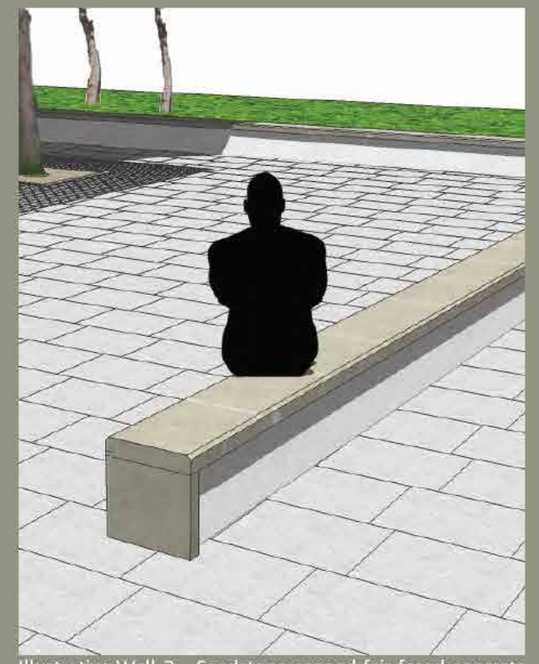
## Arrival space walls

A 500mm high x 500mm wide wall is proposed in the arrival space to provide the user with a clear sense of arrival and a feeling of entering a high quality robust space appropriate to the high level of activity expected. The wall is capped with a sandstone coping to match the proposed architectural cladding. LED strip lighting housed within the stone capping will wash a field of light down the white face of the wall. In order to fully contain the arrival space the wall is designed in two configurations: as a free standing wall and as a retaining wall for the planters adjacent to the building facades. Both walls are lit on the side facing inwards only.

The Labs building also includes a 700mm precast free standing wall that forms the threshold to the building entrance (not illustrated).

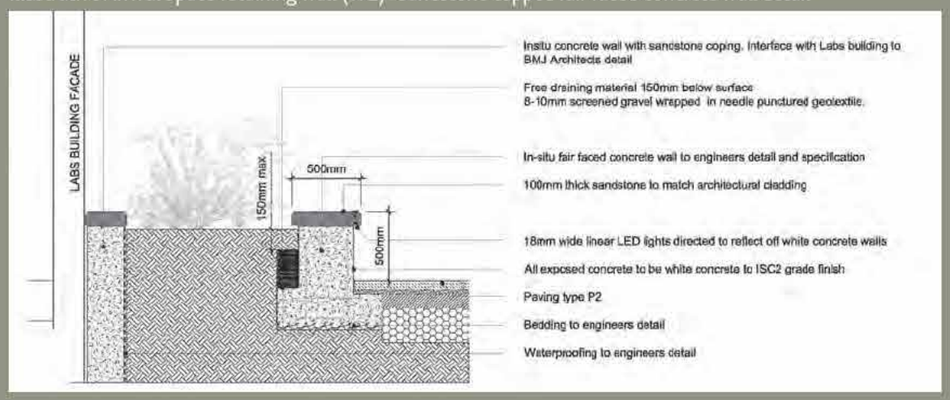


Illustrative Arrival Space free standing wall (W2)- Sandstone capped fair faced concrete wall detail

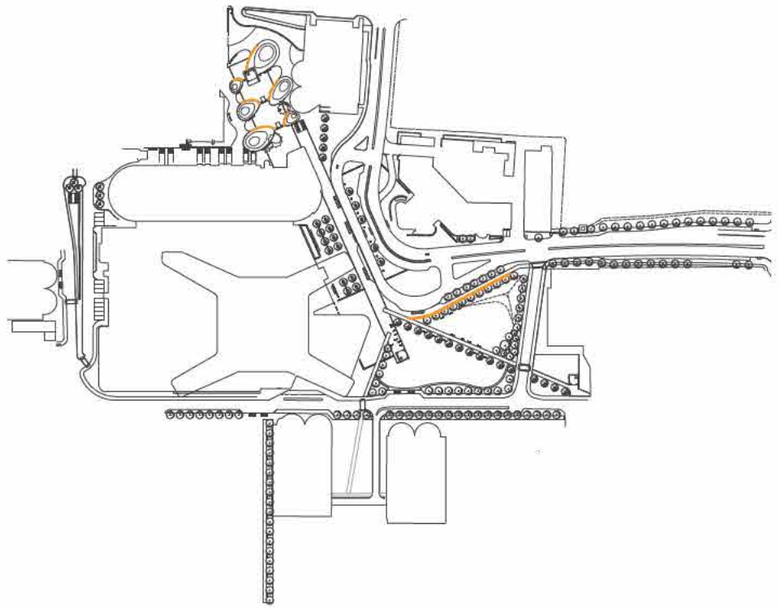


Illustrative Wall 2 - Sandstone capped fair faced concrete wall elevated view

Illustrative Arrival Space retaining wall (W2)- Sandstone capped fair faced concrete wall detail



Indicative lit wall to Arrival Space



## Walls Outside Arrival Space

Outside the arrival space there are also a number of precast walls. In the Children's park a 400mm wide wall retains the western side of the grass mounds. This is set at 300mm high to absorb the level changes and to provide a low informal seating edge for small children.

A 500mm wide free standing wall runs along the western edge of the central park to direct pedestrians towards the entrance, define the park edge and provide informal shaded seating edge under the Oak trees.

A4984228

# 8.0
# Hardworks Strategy
## 8.1
## Introduction

A palette of hard materials has been identified for the new development within the campus. This palette ranges from high quality natural materials in primary public spaces, to a more functional range of treatments in less significant areas.

The palette of hard landscape materials will create a cohesive and legible public realm to define a campus character which responds to the hierarchy of designed places. The design of a sequence of clearly identifiable places will enhance wayfinding and circulation. It will achieve this through the use of a range of surfacing materials which reinforce the character of particular areas. Hardscape treatments will act to differentiate as well as unify destination hubs and transition zones, responding to the environmental conditions, be it by providing pedestrian, shared or vehicular surfaces.

Variety is desirable and will ensure visual interest and richness as well as providing a clear hierarchy of spaces and a sense of arrival. Level transitions, pedestrian ramps and service covers are carefully considered to avoid clumsy transitions between surfaces at the point of construction.

## Functional Palette of Materials

The hardscape environment has been designed with regard to the environmental impact, function and sustainability of the materials. Permeable gravel surfaces permit surface water infiltration, whilst hard wearing surfaces delay the need for replacement materials and are used where the greatest level of activity is anticipated. Sustainable drainage systems are accommodated with surface run off being directed towards surface level drainage which is filtrated through a reed bed system. All materials will accord with the relevant British Standards and the palette has been configured to meet BREEAM standards for ‘Excellence’.

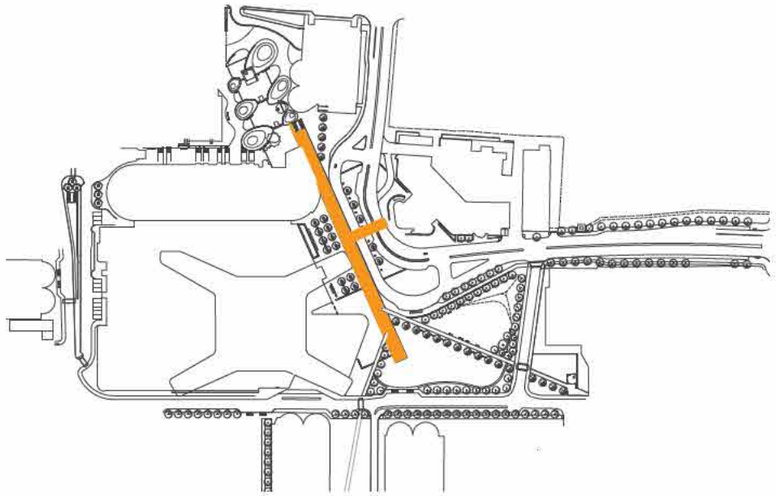
## 8.2
# Granite Dock Feature Paving (P1)



The dock feature is to be paved with a high quality palette of warm colour granite setts. The colour pallet will reference the rich and distinctive granite streets found in Glasgow City centre, such as Buchanan Street and Candleriggs.

The slim paving module size has been chosen specifically to emphasise the linear dock geometry. The paving feature is further enhanced by a stainless steel edge that contains the granite within. The setts are to be laid on a rigid subbase with mortar joints in order to provide the necessary robustness for the expected level of foot fall and vehicular overrun. The bus stop bay incorporated within this paving will be constructed using shorter lengths of the same granite to increase rigidity.

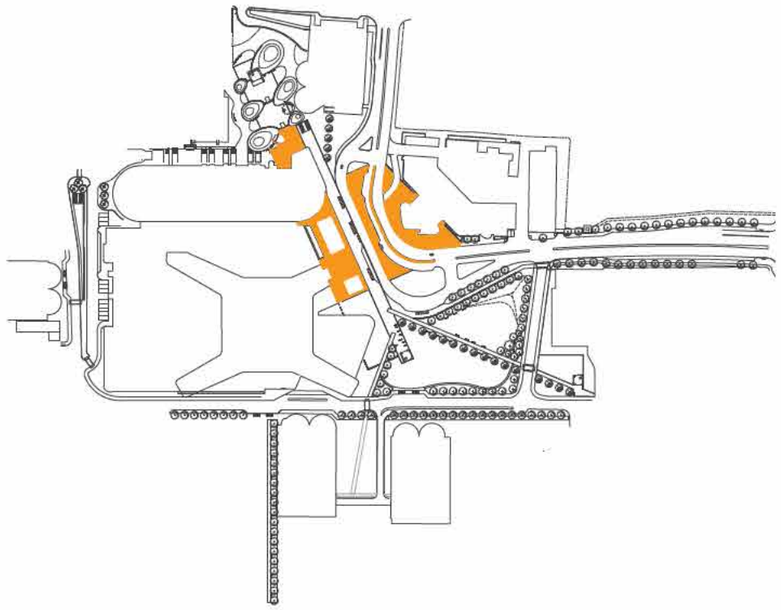
Plan view

## 8.3
# Arrival Space Flag Paving (P2)



The arrival space is to be paved with a high quality exposed aggregate concrete paver. The large module size was chosen to provide a clear contrast with surrounding materials. This is necessary to strengthen the character and provide a sense of arrival for this space.

The material is a clean and contemporary silver grey colour, with a quantity of granite aggregate that provides a sparkle to the product. The light colour will lift the space which is in shadow much of the year. The paving extends between the Adults and Children's hospitals (including the islands crossings) and is bound by the low lit walls which further serve to mark the central arrival space as an area of high quality and significance of the scheme.

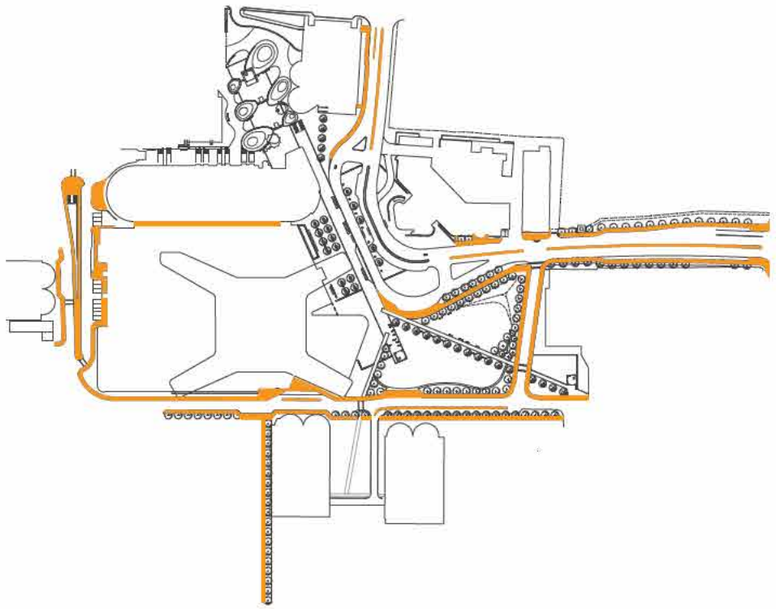
## 8.4
# Footpath Paving (P3)



All footpaths leading up to the arrival space (excluding the parks) are to be paved in a small square mid/light grey concrete paving module. The 400mm x 400mm module is deliberately smaller to contrast with the arrival space paving and to suit the narrower pavement widths associated with areas outside of the hub. The paver will also feature a recycled content in its make up.

|---|---|
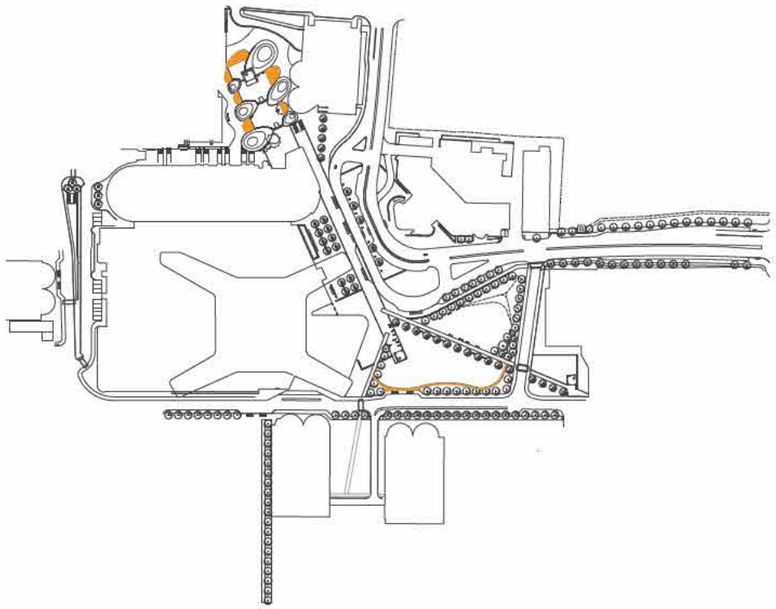
| LOCATION | CENTRAL PARK |
| DIMENSIONS (mm) | NA |
| COLOUR | BUFF |
| FINISH | TEXTURED ROLLED IN |

Natural aggregate finished surface

A4984228

## 8.6
## Self binding gravel (P6)



A secondary hard material to the parks will be a self binding gravel, which is proposed to the informal path/jogging track in the central park.

Self binding gravel is also proposed in the bays that flank the soft play surface in the Children's park. This softer material creates a softer surround to the boulders and logs placed in the bays. Where play equipment occurs the self binding gravel will be replaced with bark chippings locally to provide a safety zone

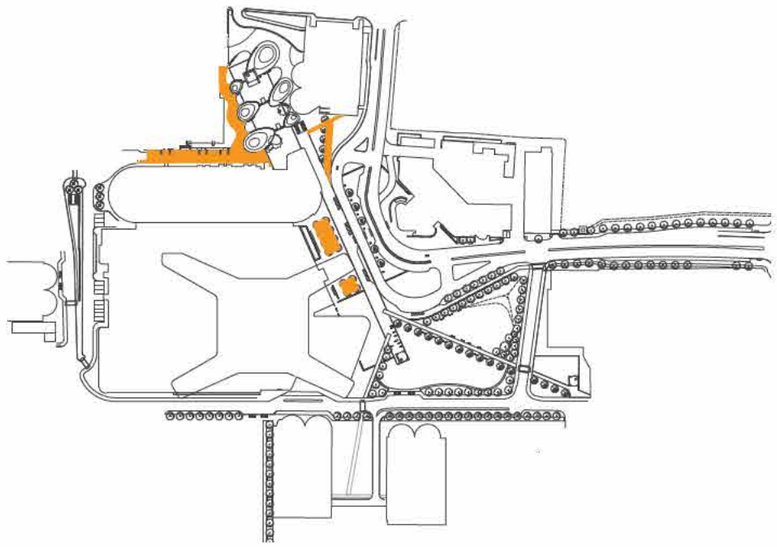
## 8.7
# Concrete Block Paving (P9)



Block pavers are proposed in 2 locations within the scheme. Permeable block pavers (P9) are proposed in the vicinity of the Children's hospital, to paths from car park 2 and under the trees in the arrival space. These are necessary to achieve the BREEAM excellent rating. Two shades of cream/ light brown are proposed in order to provide a warm surfacing for the campus.

# 9.0
# Softscape Strategy
## 9.1
## Introduction

A broad palette of soft landscape components has been proposed to articulate the design intent of the masterplan and to reinforce the character of the many designed places. This palette has also been selected to respond to the environmental conditions and settings defined by the built form.

The predominantly native palette including native hedgerows and native oak species has been chosen to increase biodiversity on site whilst achieving an appropriate maintenance level for the campus.

Initial consultation with Glasgow City Council has identified a desire to increase the berry bearing trees and shrubs in the locality, including the planting of Swedish whitebeams and other Sorbus species. These species will provide additional habitat for the local bird population notably the Waxwing. Silver birch and alder are also recognised as important species for local biodiveristy.

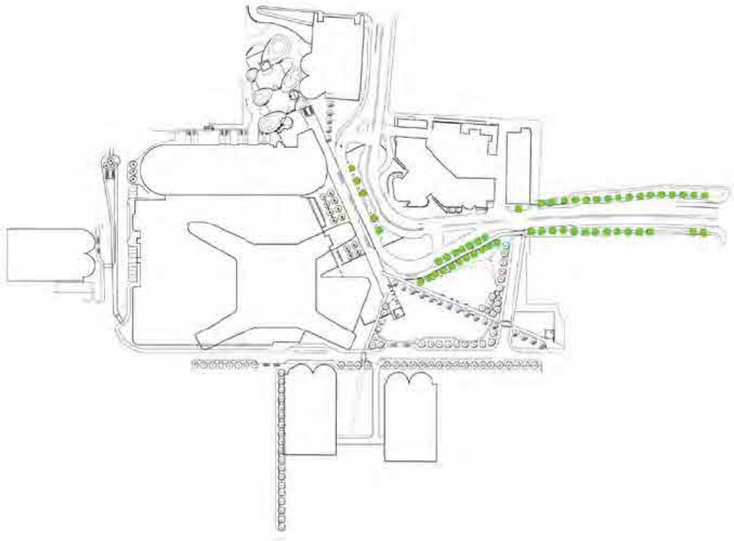
## 9.2
## Entrance Boulevard Trees



In reference to Glasgow's ship building past, Oak trees have been chosen to line the boulevard leading to the main hospital complex. They have been selected to replace oak trees that are scheduled to be felled during site clearance. The size (8-10m) and quantity of Oaks proposed will, in time far exceed the biomass of those lost during construction.

Both Pin Oak (Quercus palustris) and the native Sessile Oak are included within the soft landscape proposal.

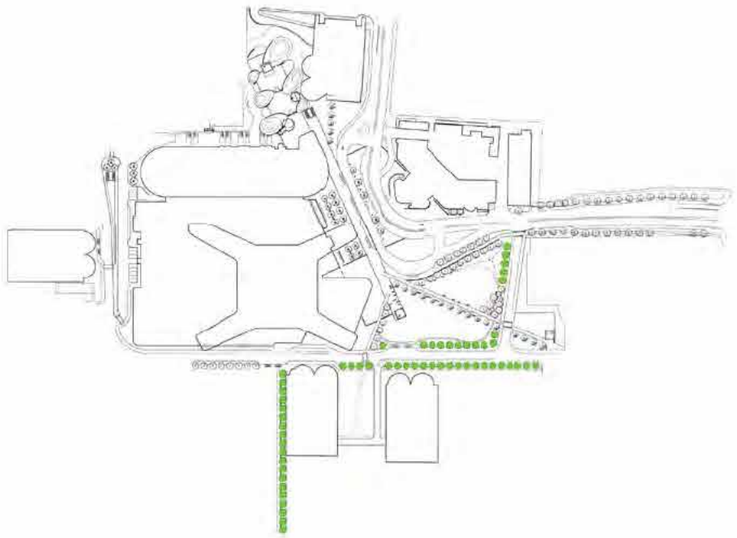
Stunning autumn colour along with the regal sense of legacy and stability inherent in the Oak will ensure that these trees make a significant contribution to the character of the site in years to come.

Autumn Colour - detail

Autumn Colour - form

Quercus palustris - street planting

## 9.3
## Street Trees



The Hornbeam (Carpinus betulus) is often used as a parkland or street tree due to it's fresh green foliage and form. These trees will inhabit the secondary roads around the site, surrounding the central park as a graduation between the civic character of the streets and the relaxed atmosphere of the park.

Carpinus betulus - foliage detail

Carpinus betulus - natural form

Carpinus betulus - foliage

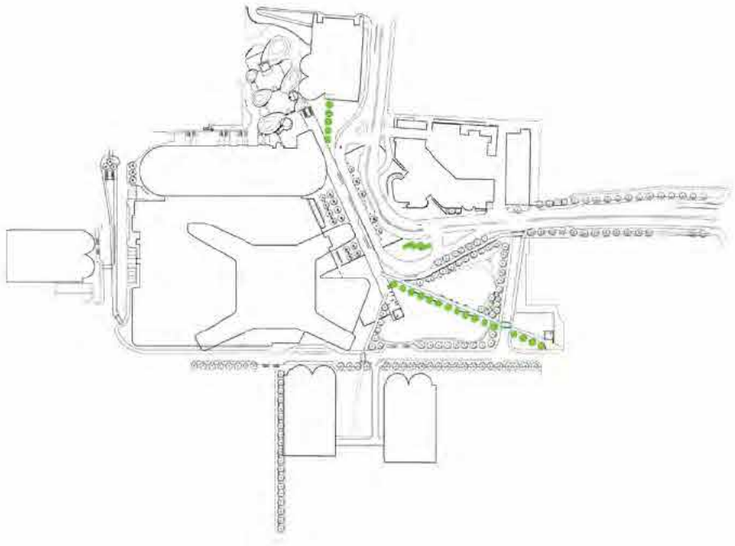
## 9.5
# Central Park Axis Trees

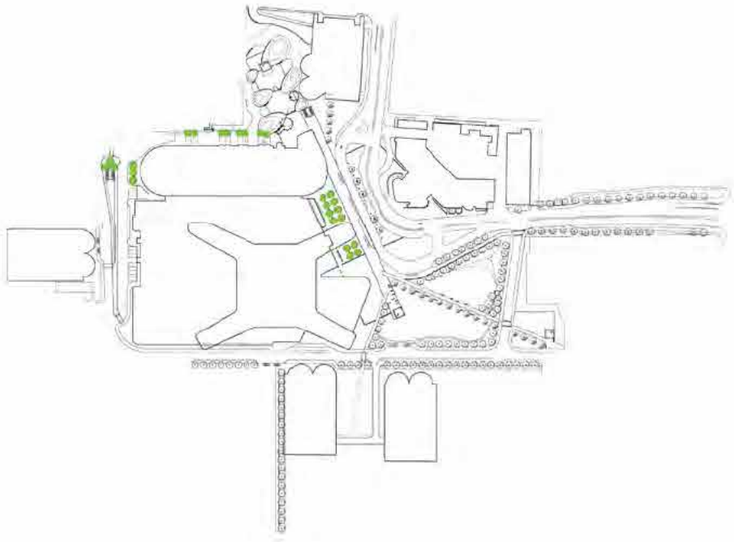


Wild Cherry (Prunus avium) forms an avenue along the main axis through the central park. It's biodiversity value, intimate scale and spring blossom will all contribute to emphasise the rhythm of the seasons throughout each year.

Prunus avium (Wild Cherry)

A4984228S

## 9.6
# Plaza Trees



The entrance boulevard stretches into the Arrivals Space with a line of Pin Oak (Quercus palustris) opposite the main building. A group of native Aspen (Populus tremula) sit at the foot of the building, their fresh open canopy and audible foliage activating the entrance area. The tree canopy in this prime location will also help mitigate against adverse wind conditions.

Inhabiting the more intimate spaces adjacent to the Children's Hospital are native Rowan (Sorbus aucuparia 'Golden Wonder'), Pyrus calleryana 'Chanticleer', Amelanchier aborea 'Robin Hill' and Amelanchier lamarkii - all chosen for their stunning autumn colour, blossom and resilience to demanding weather conditions.

Sorbus aucuparia 'Golden Wonder' (Rowan)

Populus tremula - foliage detail

Quercus palustris (Pin Oak) Autumn Colour - form

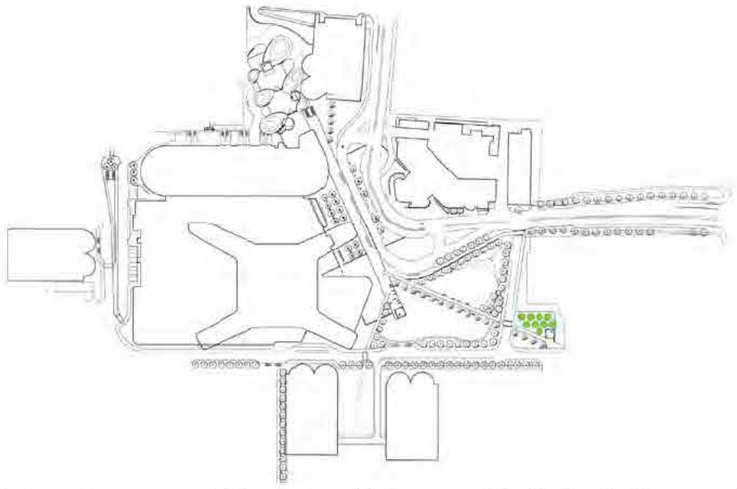
## 9.7
# Community Orchard Opportunity



Scotland has a long history of gardening associated with its towns and cities - of which orchards were an important part. Prior to the industrial revolution Glasgow was associated with gardens:

*"the city was surrounded by kitchen and flower gardens, and beautiful orchards, abounding in fruits of all kinds, which, by reason of the open and large streets, send forth a pleasant and odoriferous smell."*

John M'Ure, alias Campbell, Clerk to the Registration of Seisins, and other Evidents for the District of Glasgow

This space provides an opportunity to create a community orchard that draws on the heritage of Glasgow and it's environs as a fruit growing district. In partnership with the Commonwealth Children's Orchard Scheme this small orchard has the potential to provide a valuable link between the hospital landscape and the surrounding community acting as a space for education and food production.

As the proposed area is adjacent to the central park axis it could act as an easily accessible platform for those visiting the site to find out more about community food production. Ongoing management of this area is proposed to be handed over to these local groups with the intention of creating a sense of community ownership .

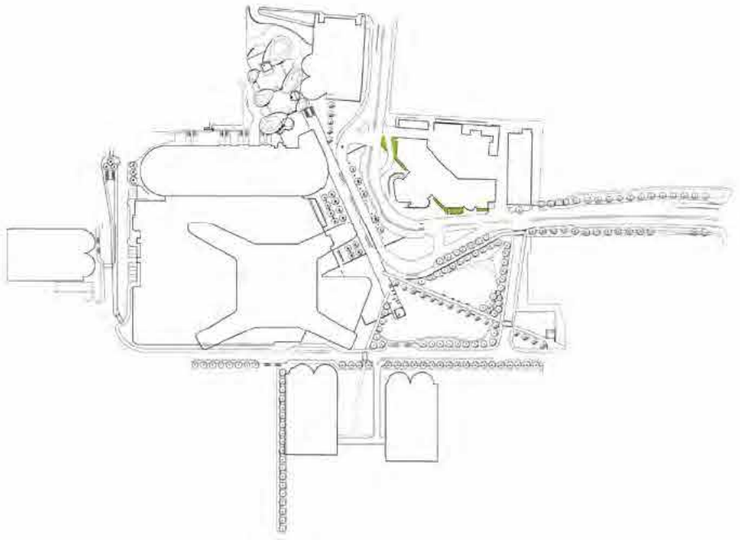
## 9.9
# Formal Planting

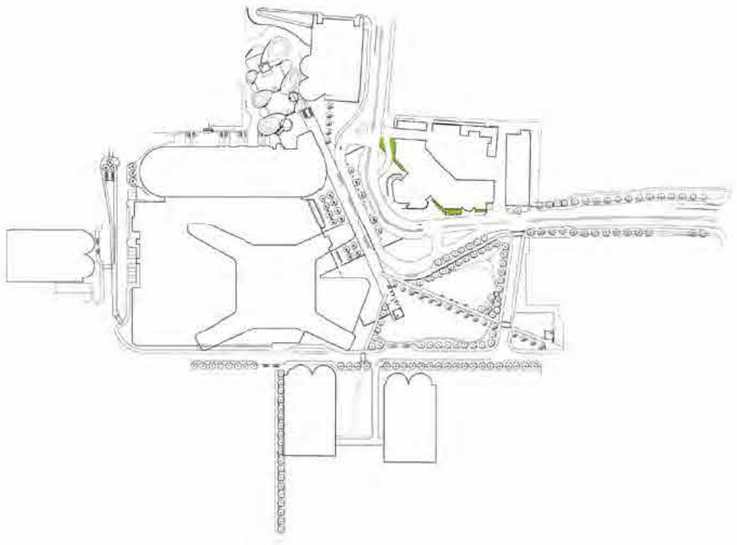


### Structure Trees (Sun)

A cultivar of the Himalayan Birch (Betula var. Jacquemontii 'Grayswood Ghost') is chosen for it's intense white bark and along with the Juneberry (Amelanchier lamarkii) is planted sparingly in planting beds adjacent to the laboratory building in order to provide a vertical dynamic to the more ornamental planting of these sunnier formal areas.

Amelanchier lamarkii (Juneberry)

Betula var. jacquemontii 'Grayswood Ghost'



## Structure Planting (Sun)

A more ornamental approach is taken to the planting in these areas. A mixture of herbaceous perennials, evergreen grasses and shrubs take advantage of the lighter aspect in these areas.

Most of the plants chosen here flower at different times of the year providing a colourful rhythm to the main thoroughfare and entrance to the laboratory building.

Liriope Muscari 'Big Blue'

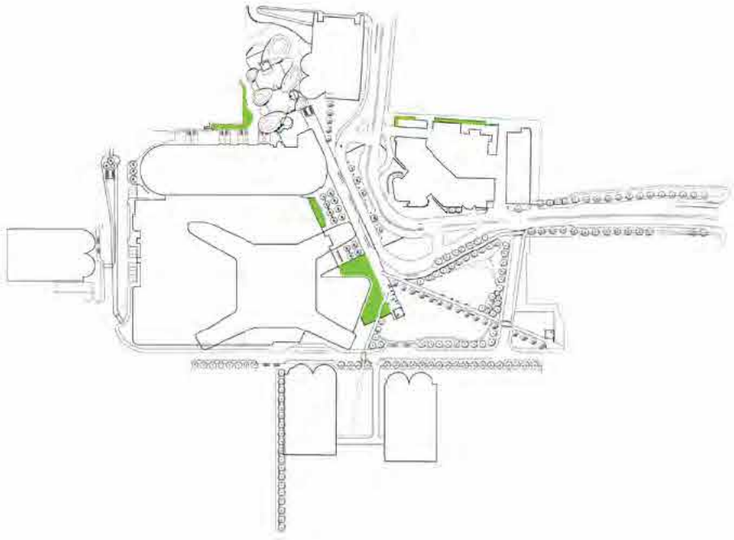
Salvia x sylvestris 'Rose Queen'

Libertia grandiflora

Verbena bonariensis

Choisya x dewitteana 'Aztec Pearl'

Polystichum setiferum 'Plumosodivisulobum Group'

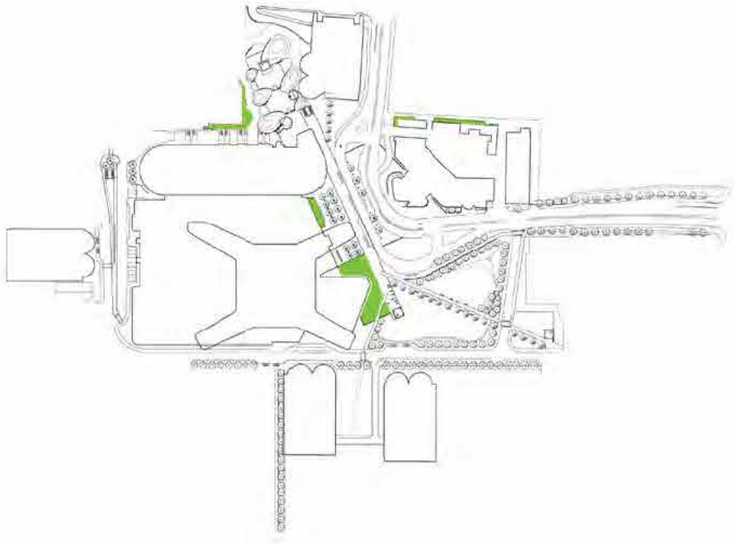


## Structure Trees (Shade)

This area is intended to be reminiscent of pioneer woodland found throughout the North of the UK.

A birch stand growing through a dense carpet of foliage will act as a memorable primeval landscape at the entrance of the main hospital building. As one moves passed and through this landscape and the bright white bark of the Birch (Betula var Jacquemontii 'Grayswood Ghost') is reflected in the glass of the building facade a rhythm is created as each white stem crosses another as viewing angles change.

Betula var. jacquemontii 'Grayswood Ghost'



## Structure Planting (Shade)

A mixed herbaceous groundcover layer consisting of evergreen ferns, Liriope and Variegated Comfrey.

The light foliage of the Birch allows a dappled light to permeate through the canopy picking out the blooms of the Liriope and the Comfrey as well as the gold edge of the variegated foliage. The semi evergreen ferns resonate with the theme of the primeval woodland whilst providing a binding groundcover texture that stretches out beneath the birch bark to the building facade.

Liriope Muscari 'Big Blue'

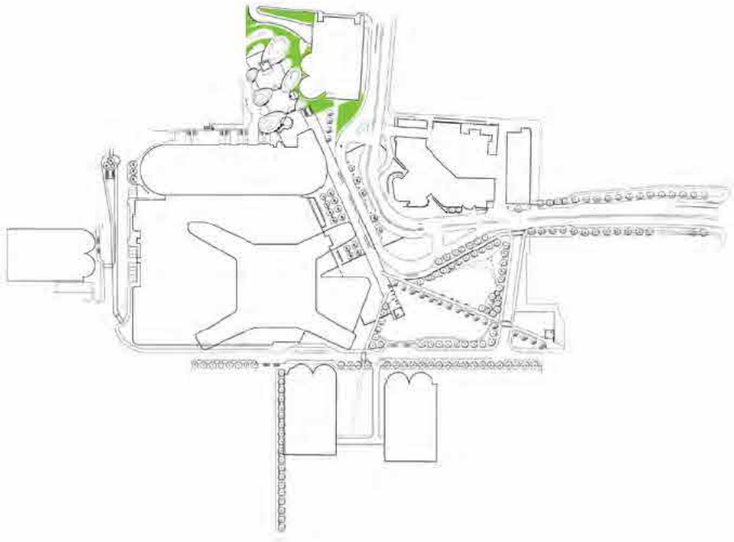
Dryopteris affinis 'Cristata'

Symphytum x uplandicum 'Variegatum'

Polystichum setiferum 'Plumosodivisulobum Group'

A4984228

## 9.10
# Woodland Planting



### Trees

The theme of pioneer woodland is extended from the entrance of the main building to the form the setting of the play landscape.

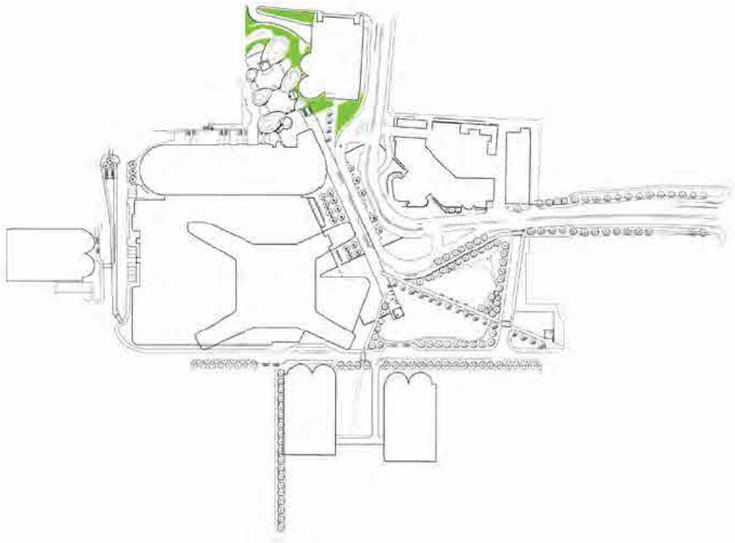
A range of standard specimens and multistem Birch (Betula pendula, Betula pubescens,) along with Scots pine create pockets of woodland that form around the landscaped mounds of the play zone whilst anchoring the pavilion structure into it's landscape setting.

Betula pubescens (Downy Birch) - catkins

Betula pubescens (Downy Birch) - foliage

Betula pendula (Birch) - multistem

Pinus sylvestris (Scots Pine)



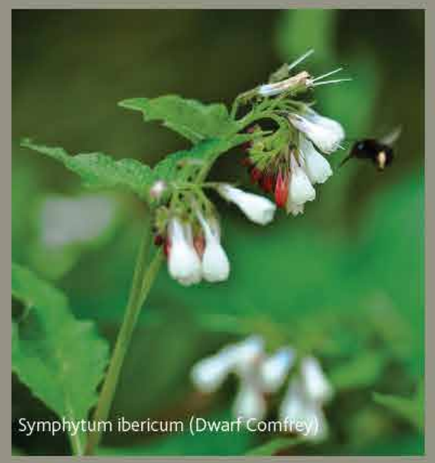
## Planting

Beneath the canopy of the woodland an intricate matt of woodland groundcover plants are encouraged to proliferate with the intention of creating an intriguing woodland environment that stimulates the imaginations of kids using the play zone.

Ajuga reptans (Bugle)

Asplenium scolopendrium (Harts Tongue Fern)

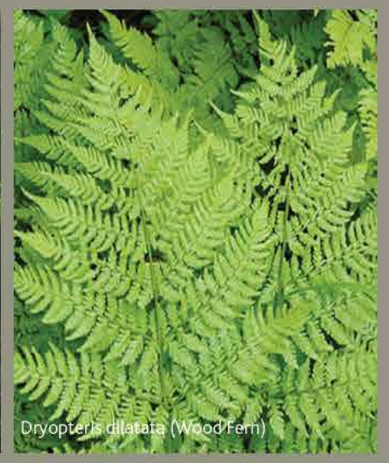
Fragaria vesca (wild Strawberry)



Symphytum ibericum (Dwarf Comfrey)

Carex pendula (Pendulous Sedge)

Matteucia struthiopteris (Ostrich Fern)



Dryopteris dilatata (Wood Fern)

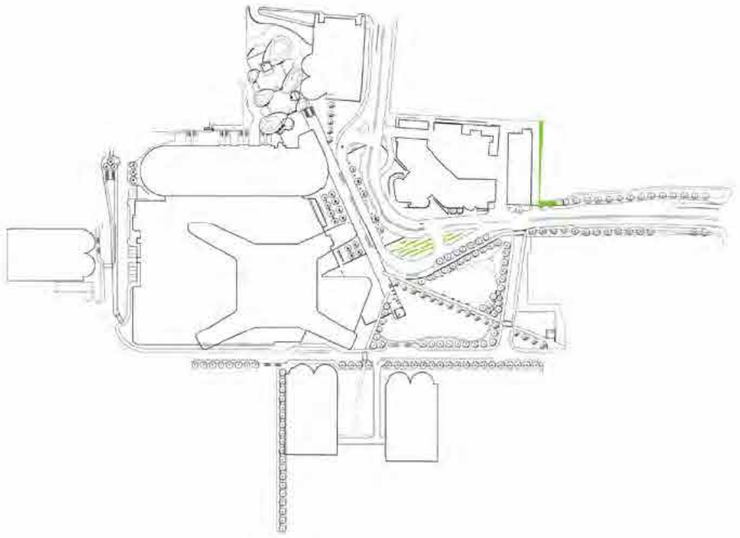
Helleborus foetidus (Stinking Hellebore)

Anemone nemerosa (Wood Anemone)

Alium ursinum (Ramsons)

Corylus avellana (Hazel)

## 9.11
# Hedgerow Planting

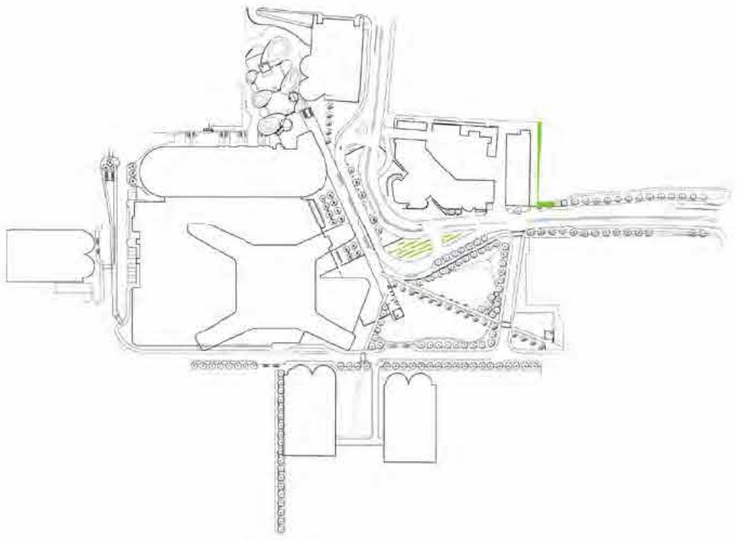


### Trees

The native Bird Cherry (Prunus padus) will punctuate the proposed hedgerow strips around the site. Its blooms are particularly good for attracting insects and therefore other wildlife into each hedgerow.

Prunus padus (Bird Cherry) - form

Prunus padus (Bird Cherry) - foliage and blossom



## Planting

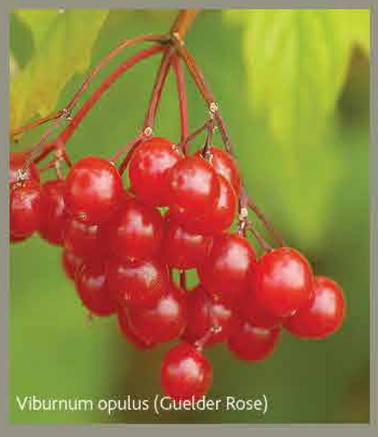
A palette of native hedgerow plants chosen for seasonal interest and wildlife value.

Each hedgerow strip can be managed to form a dense band of planting or left to grow taking on a more traditional rural form. Each providing a rich habitat for insects and birds.

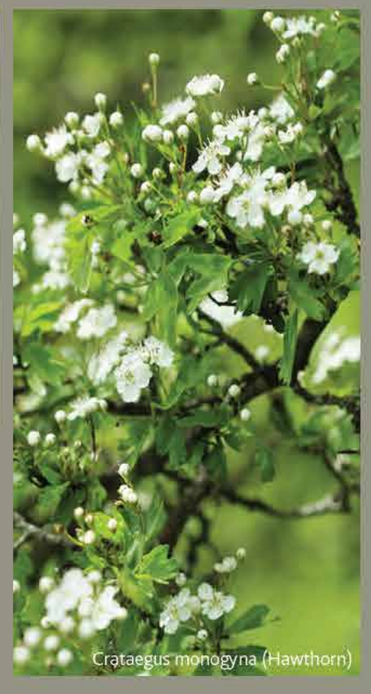
Sambucus nigra (Elder)

Ilex aquifolium (Holly)

Ligustrum vulagare (Wild Privet)



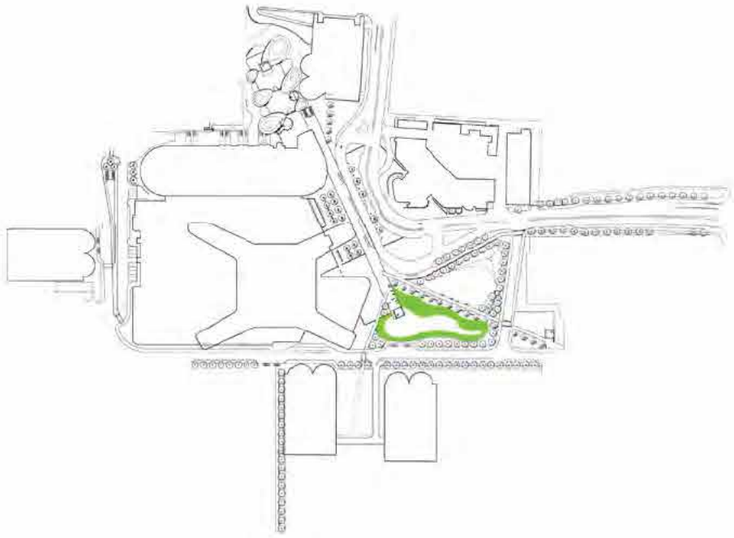
Viburnum opulus (Guelder Rose)



Crataegus monogyna (Hawthorn)

Corylus avellana (Hazel)

## 9.12
# Wet Woodland Planting



### Trees

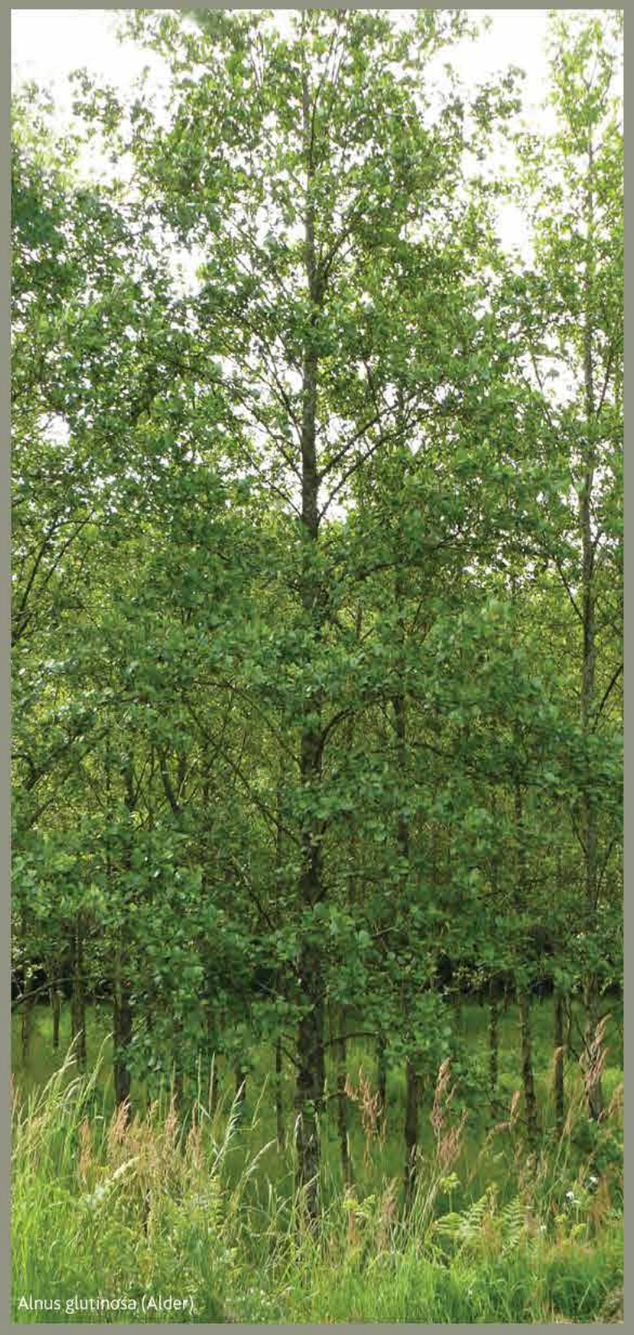
Wet woodlands in Scotland are traditionally semi natural landscapes that represent the succession from wetland to woodland. They are a unique and increasingly rare habitat populated by pioneer tree species and marsh plants.

One of the types of wet woodland intrinsic to Scotland is dominated by Bay Willow (Salix pentandra) and Bottle sedge (Carex rostrata), as is the case in this proposal area. Other species of pioneer tree proposed are: the Common Sallow (Salix cinerea ssp. oleifolia), Downy Birch (Betula pubescens), Goat Willow (Salix capraea) and Alder (Alnus glutinosa).

As an amalgamation of wet woodland planting types it is intended that this planting mix be allowed to evolve. The unique demand placed on this area as it receives landscape run off from the site means that certain species will thrive over others as it matures over time.

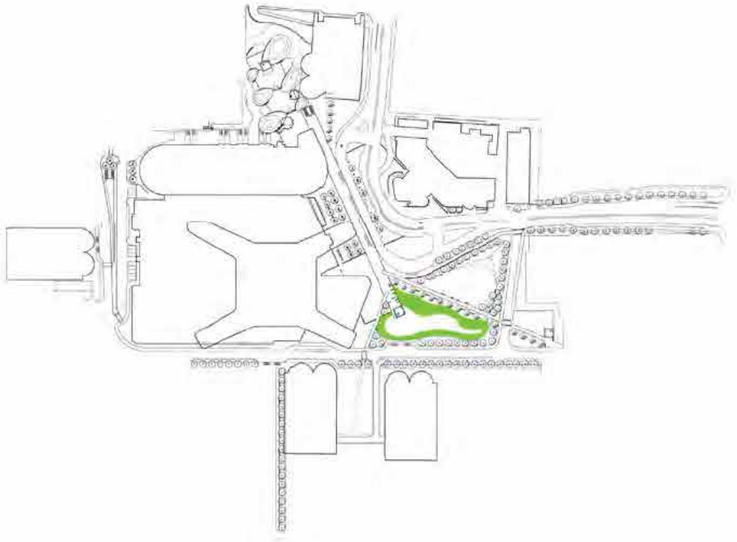
Salix pentandra (Bay Willow)

Salix caprea (Goat Willow)



Alnus glutinosa (Alder)

Salix cinerea ssp. oleifolia (Common Sallow)



## Planting

Native marsh and SUDS species that are often found in scottish wet woodland. These species are chosen as they are tolerant of both damp conditions, waterlogging and infrequent inundation.

As the boundary between the dry and wet areas in this space change, so will the range of each different species, thereby mapping the reach of seasonal inundation events.

Caltha palustris (Marsh Marigold)

Lytrum slicaria (Purple Loosestrife)

Carex paniculata (Great Tussock Sedge)

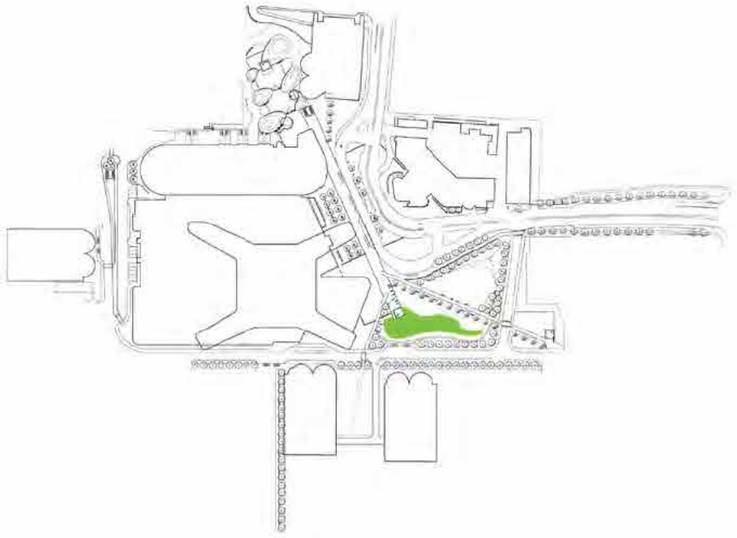
Angelica sylvestris (Wild Angelica)

Carex pendula (Pendulous Sedge)

Caltha rostrata (Bottle Sedge)

A4984228

## 9.13
# Swale Planting



Native species are chosen for wildlife interest and vigour. The intention being to allow the more successful species to thrive forming a patchwork across the permanently wet areas within this functional and ecological diverse area.

As the boundary between the dry and the wet areas in this space change, so will the range of each different species, thereby mapping the reach of seasonal inundation events.

Carex rostrata (Bottle Sedge)

Phragmites australis (Common Reed) - winter

Mentha aquatica (Water Mint)

Juncus effusus (Common Rush)

Typha latifolia (Reed Mace)

Iris pseudocorus (Yellow Flag Iris)

Juncus articulatus (Jointed Rush)

Sparganium - erectum (Branched Bur Reed))

## 9.14
# Bulb Planting

### Central Park:

Classic parkland bulb species chosen to emphasise the seasonal changes throughout the year.

### Woodland:

Like the park species, each species within this range of bulbs will bloom at certain points in the  year thereby announcing the rhythm of the seasons and dramatically altering the whole woodland space during that moment in time. This is intended to add to the magical quality of the woodland play space.

Central Park ▼

Narcissus ssp. (Daffodil)

Crocus ssp.

Woodland ▶

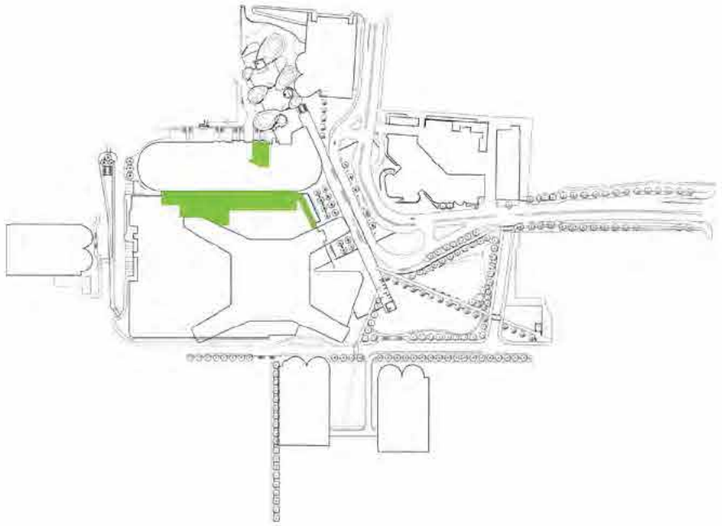
Alium ursinum (Ramsons / Wild Garlic)

Petasites hybridus (Butter Bur)

Galanthus ssp. (Snowdrop)

Hyacinthoides non scripta (Bluebell)

## 9.15
# Childrens Roof Garden Planting



### Trees

The intention of the Childrens Roof Garden is to stimulate the senses of the children staying at the hospital. The varieties of trees chosen extend the theme of seasonal change proposed within the ground floor landscape up onto the roof terrace. Blossom and autumn foliage will change the space throughout the year whilst providing wildlife interest, vertical punctuation and summer shading along with the pergola stuctures.

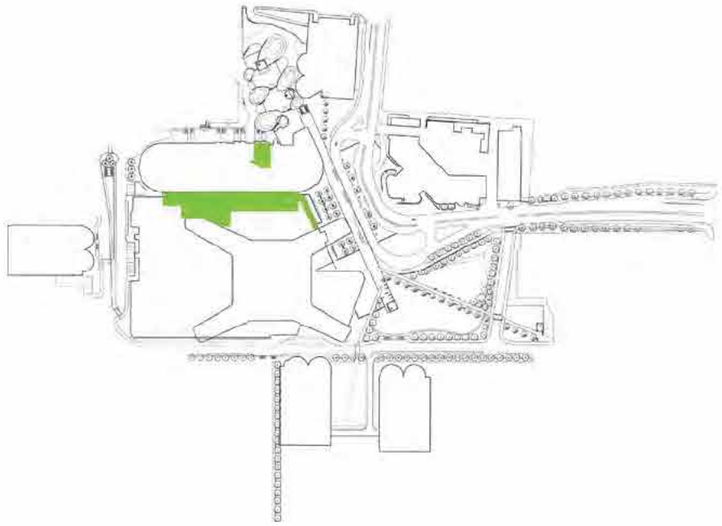
Amelanchier arborea (Downy Juneberry)

Amelanchier arborea (Downy Juneberry)-autumn

Amelanchier arborea 'Robin Hill' (Downy Juneberry)

Pyrus calleryana 'Chanticleer' (Ornamental Pear)

Sorbus aucuparia 'Golden Wonder' (Rowan) - berries and foliage



## Herb Garden

The herb garden offers kids the opportunity of outdoor activity. Easy access raised planters are provided to give kids access to gardening with edible and medicinal herbs and flowers. The intention being to boost levels of well being by providing interaction and tactile experience in an outdoor environment.

Rosmarinus officinalis (Rosemary)

Alium schoenoprasum (Chives)

Cynara cardunculus .Scolymus (Artichoke)

Echinacea ssp.

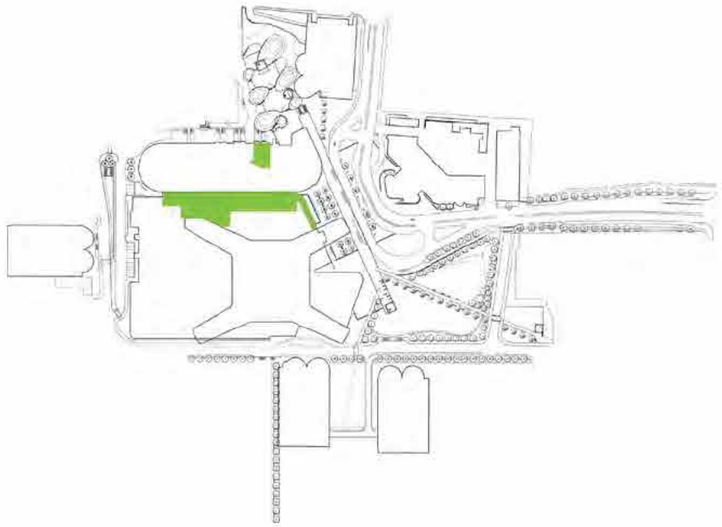
Tropaeoleum majus (Nasturtium)

Oreganum vulgare (Oregano)

Thymus citriodorus Variegatus (Lemon Thyme)

Salvia officinalis 'Purpurascens' (Purple Sage)

A4984228



## Planting

A mixture of native and non-native sensory planting chosen for maximum colour, scent, sound and texture.

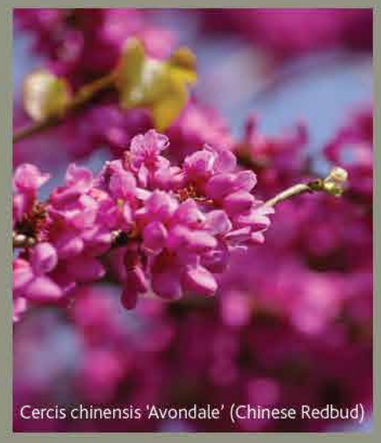
Coryllus maxima 'Purpureum' (Purple Hazel)

Lavandula angustifolia (Lavender)

Heuchera 'Rave On'

Iris foetodissima (Stinking Iris)

Libertia grandiflora



Cercis chinensis 'Avondale' (Chinese Redbud)

Heuchera 'Plum Pudding'

Heuchera 'Lime Rickey'

Miscanthus sinensis 'Gracillimus'

Miscanthus sinensis 'Zebrinus'

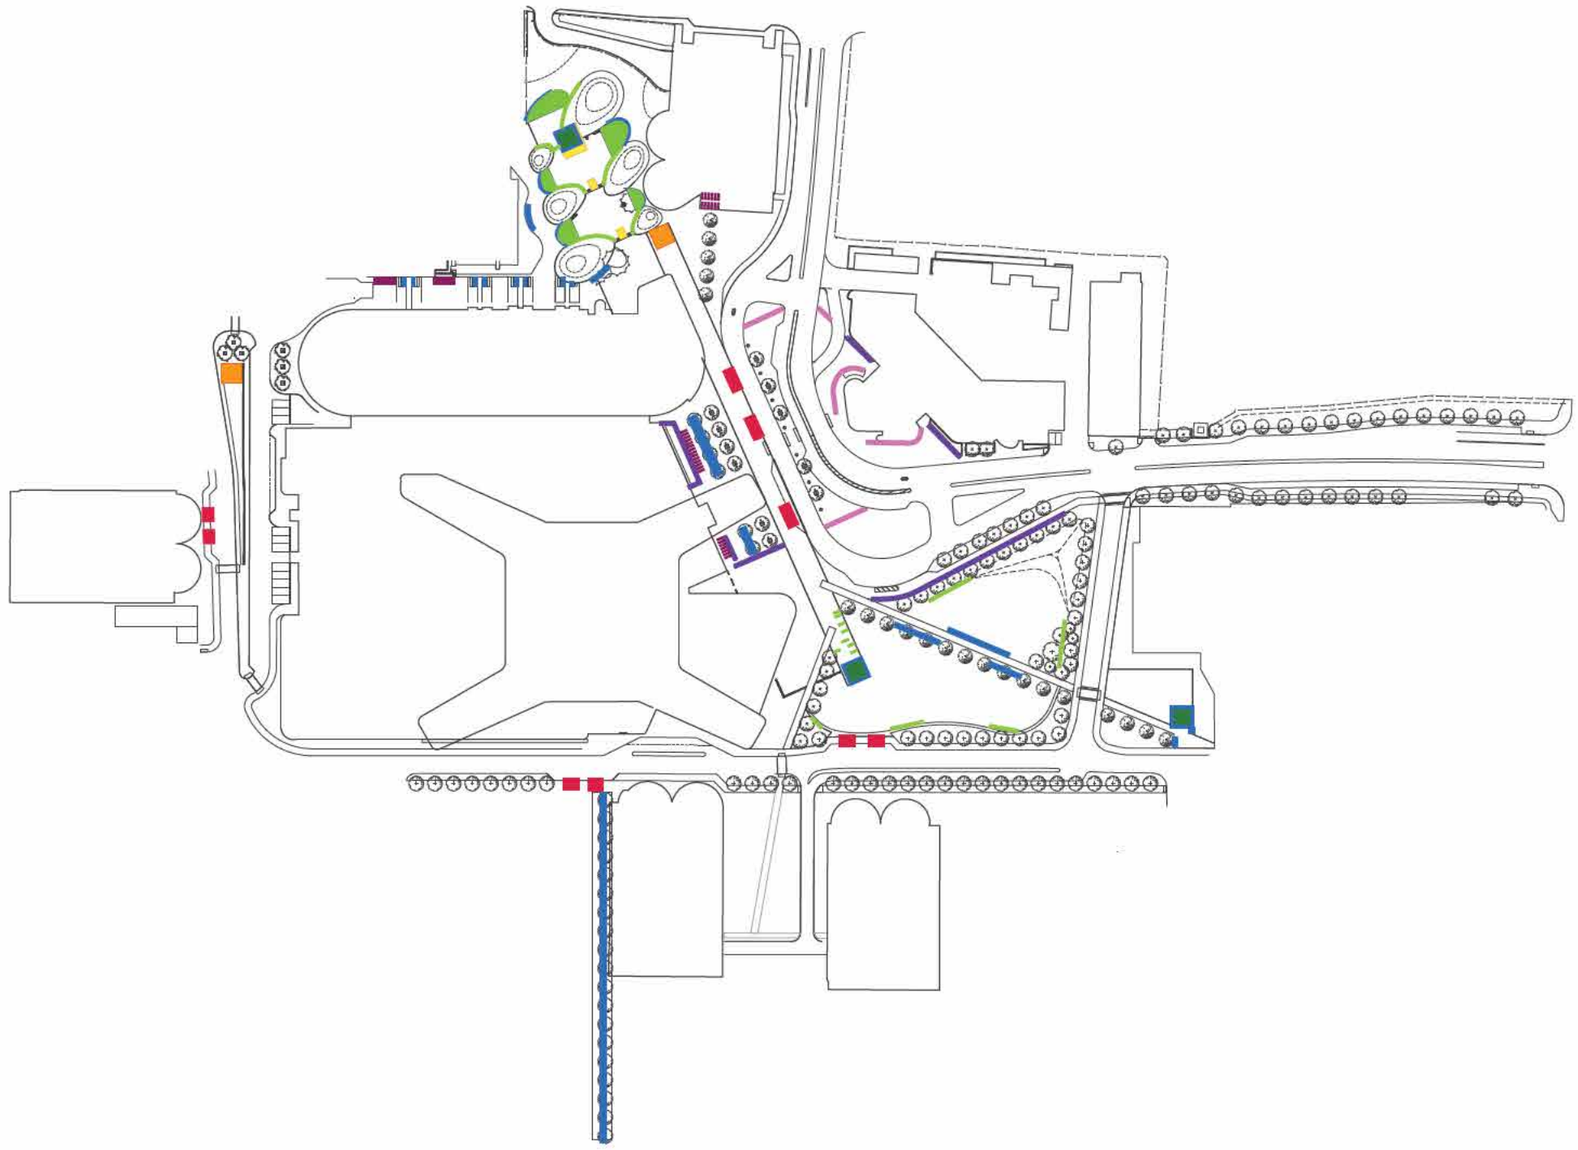
# 10.0
# Furniture Strategy
## 10.1
## Introduction

The furniture strategy is designed to respond to the variety of environments experienced across the campus, to provide robust, practical, comfortable and attractive features. Some seating is to be constructed on site, in the form of low seating walls, and other elements supplied as individual pieces of furniture. In addition the opportunity will be explored to utilise reclaimed sandstone from site demolition to create seating features in the parks.
Design will vary according to the locality but quality will not be compromised. A complementary palette of bins, bollards, railings and cycle stands all add to the character and identify of the space.

Illustrative furniture in context in front of the Adult Acute main entrance

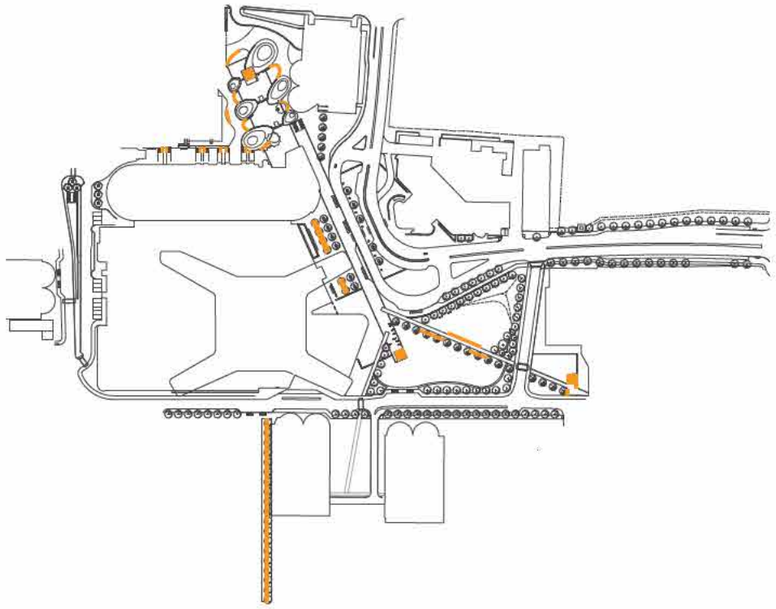
LEGEND

- Cycle shelter with stands
- Cycle stands
- Park shelter
- Timber decking
- Bus shelter
- Formal seating
- Informal seating
- Wall
- Seating wall

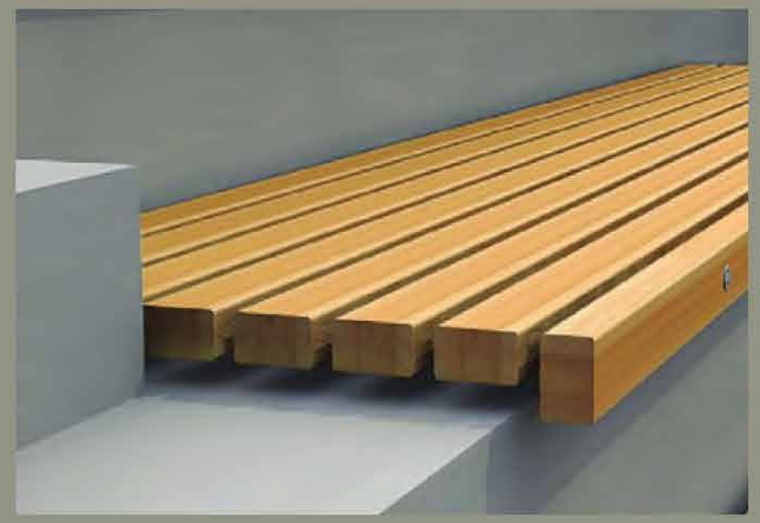


A4903422285

## 10.1
## Formal seating



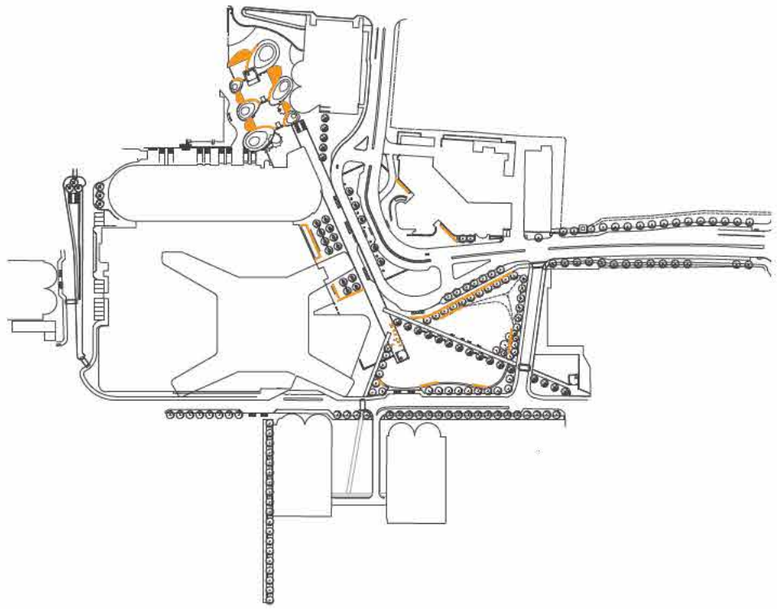
Formal seating is provided by ergonomically comfortable timber seats with back and arm rests to suit elderly users. In addition timber slats will be fitted to walls in key locations to provide a warmer seating opportunity.



Materials: Cast aluminium supports
Colour: Range
Finish: Sandblasted structure or plastic coated
Fixing: Surface mount, freestanding or embedded

Materials: Timber
Fixing: Fitted onto wall

## 10.2
## Informal Seating



In addition to timber seating with back and arm rests, more informal seating opportunities will be provided in the Children's park and central park. Furniture will be more playful and sculptural in character in the through placing of cast stone elements such as those pictured.

An opportunity has also been identified to reclaim a quantity of the sand stone lintels from the buildings scheduled for demolition. This will provide a local and sustainable source of stone suitable for placement in the parks as informal seating elements and as an edging/retaining material where necessary. Suitability of reclaimed material is subject to detailed survey prior to demolition works.

High Dependency Unit (Scheduled for demolition)

Materials: Cast stone
Colour: Grey
Finish: Acid etched & waterproofed
Seat Dims: 150Lx45Hx150D cm
Fixing: Free standing

Illustrative impression of a stone seat using a reclaimed lintel from the site (as above)

A4984228

## 10.3
# Litter Bins & bollards

Litter bins are to be simple in design and made from brushed stainless steel. They will be available in both free standing and pole mounted versions. Spacing of bollards indicated is illustrative only and will be further developed during the detailed design stage.

Materials: Stainless Steel
Finish: polished, brushed or satin

Illustrative arrangement

Materials: Stainless steel
Finish: Polished Top/Shot Peened Body

## 10.4
## Cycle Stands

Brushed stainless steel 'Sheffield' style cycle stands are proposed in open air locations, under the cafe terrace at the Adult's hospital entrance and under the link bridge between the children's hospital and maternity unit. Galvanized mild steel versions are proposed in indoor locations such as in car park 2.

In addition a two-tier cycle rack system is proposed in the cycle shelter pavilion structures to make full use of the available height. These are BREEAM compliant and are easy to operate, as proven in many successful schemes in Holland.

Two-tier cycle rack system

Materials: Stainless steel
Finish: Polished Top/Shot Peened Body

# 11.0
# Lighting Strategy
## 11.1
## Introduction

Lighting within the hospital campus will create an environment which is as welcoming and accessible during the night as it is by day. Functional lighting to routes is to be used in conjunction with feature lighting in key areas. The lighting strategy will help to identify the New South Glasgow Hospitals as a unique location whist also delivering seamless integration with the surrounding environment. The scheme will allow for the use of power efficient luminaires with appropriately low maintenance requirements. Fittings will limit light pollution by providing a variety of light levels appropriate to the locality. Stronger lights affixed on lamp posts will delineate the primary routes and entrances where high visibility is of greatest importance. Subtle use of lower intensity light fixtures, up lighters and illuminated bollards will create a more intimate and relaxed environment for secondary pedestrian destinations, whilst still providing sufficient light to permit ease of use and without disturbing wildlife which may inhabit the area.

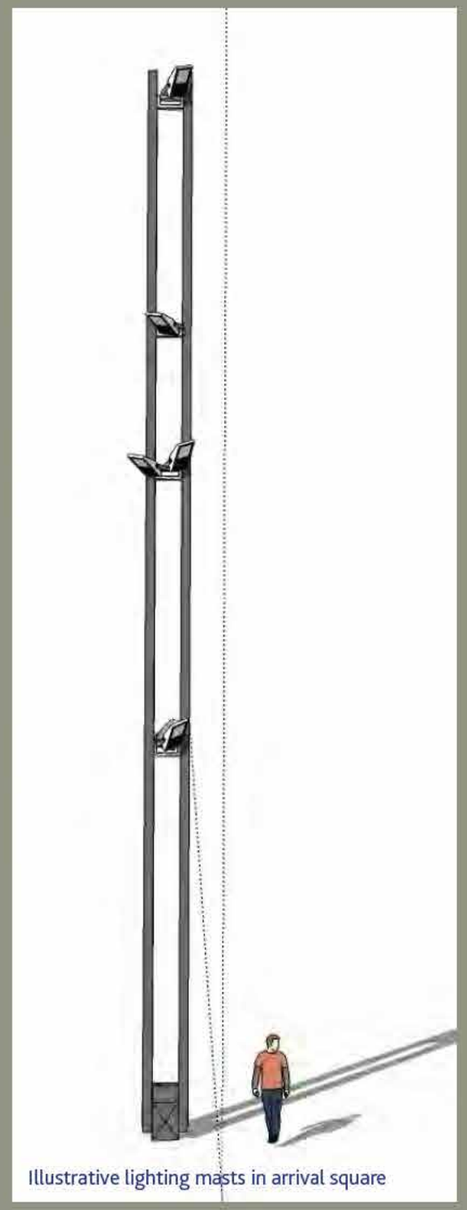
## 11.2
# Lighting Fixtures

The main feature lighting masts have already been described, and are illustrated again on this page for easy reference.

Human scale lighting will be provided within the parks, of a style that will complement other furniture and landscape features as pictured.

Integrally lit walls, illuminated bollards and in-ground tree up lights will provide the feature lighting for the scheme.



Illustrative lighting masts in arrival square

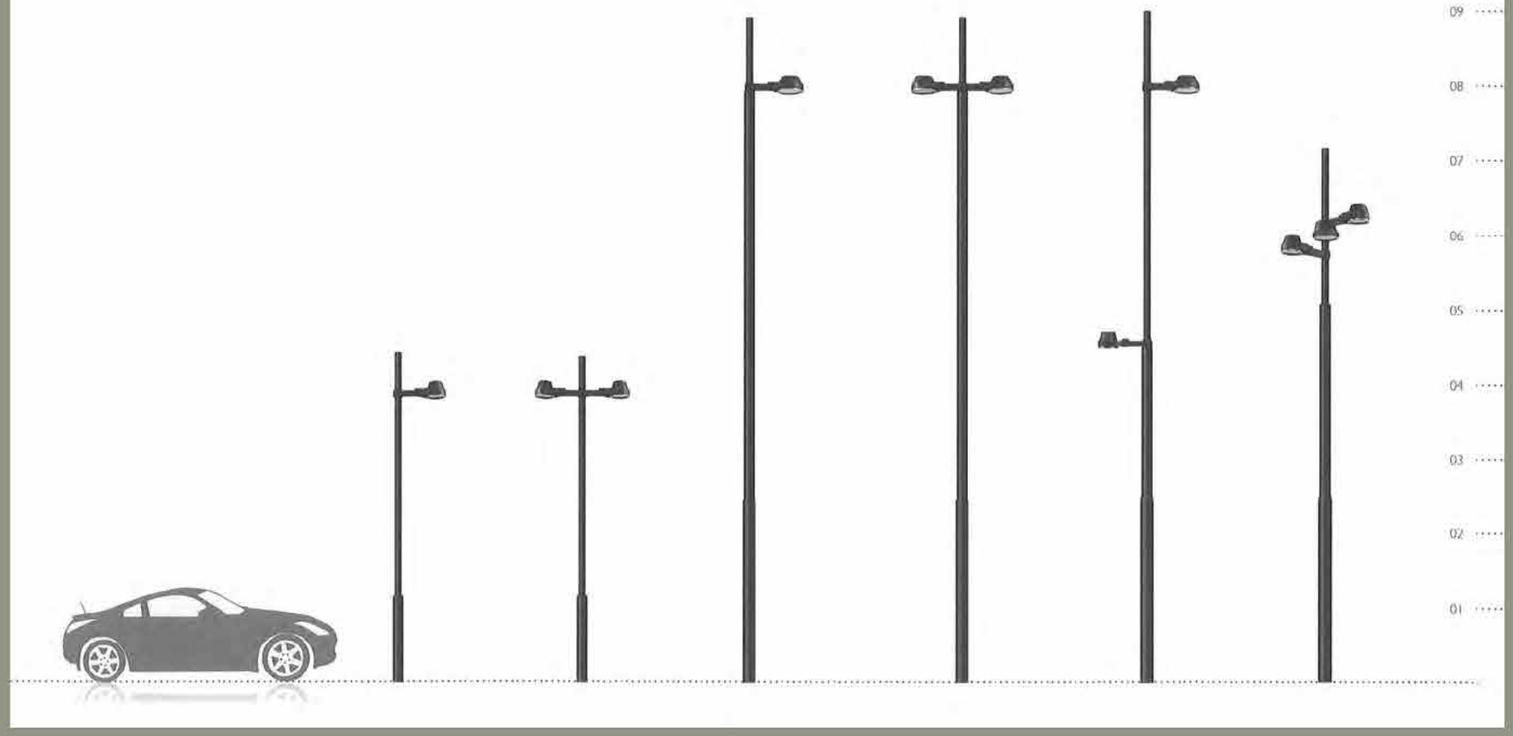
## Street Lighting

Simple and elegant street lighting  columns are proposed in a range of size options to suit the road size. The central boulevard will include the taller columns with longer arms in order to achieve the required spread of light over the highway and footpath.



Illustrative Street lighting  - range caters for a variety of road widths

A4984228

# 12.0
# Signage Strategy
## 12.1
## Introduction

There is a considerable overlap between public art and signage, but effective functional signage will also be provided to support the core functions of the hospital facilities. This functional information will be supported by the creative use of colours, forms and imagery internally and externally and with specific regard to differentiating between different areas and moderating the significant scale of the hospital buildings. The character of the wayfinding components has a big impact upon the quality and the feel of the environment. A legible place is much easier to use and this creates a better and more successful environment for staff and for visitors. The setting of the buildings, the use of colours and familiar forms communicates a favourable character for the hospital.

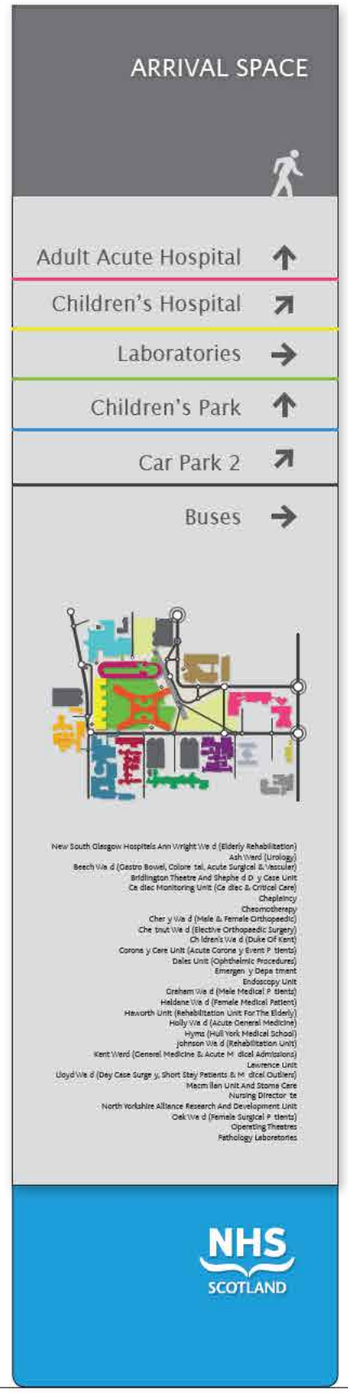
## 12.4
## Designed Example -Pedestrian sign

The illustration opposite provides an example of a typical pedestrian sign generated from the signage and wayfinding strategy for the campus. The sign is colour coded and legible with a clear hierarchy of information. Fonts are sized according to distance from eye level and positioning of the orientation map is consciously located in the middle at user eye level.



A4903412285

# 13.0
# Delivery and Maintenance

## Overview

The table opposite summarises the key maintenance requirements for the campus with particular focus on soft landscape elements.

In addition there are numerous hard landscape elements proposed onsite. All hard landscape elements including fencing, furniture, gates, access barriers and hard surfaces are to be inspected on a regular basis and minor repairs carried out as necessary. Any items considered to be unsafe should be removed or made safe and replaced as soon as possible. Surface integrity should be closely monitored to prevent slip and trip hazards, through surface cracks or vegetation encroachment. Gullies should be kept free of debris to maintain surface water drainage.

**12.0 Frequency Tables with Approximate Costs**

A4984228S

# 14.0
# Sustainability/BREEAM

## Overview

The landscape strategy seeks to support the long term sustainability requirement to achieve the BREEAM Healthcare "excellent" rating. In this regards reference shall be paid to the BREEAM "Green Guide to Specification" to maximise the use of materials and specifications achieving an A rating or better as far as is practicable.

The scheme has a number of sustainable principles imbedded within the masterplan design:

- Transportation strategy bias towards sustainable modes of transport
- Significant sustainable drainage 'swales' within park areas incorporating reed bed filtration
- Reuse of natural stone work from buildings to be demolished and incorporation into landscape as feature plinths/retaining edges etc.
- Predominantly native / wildlife value planting palette
- Use of permeable paving materials where appropriate to reduce run off
- Extensive tree planting programme to compensate trees removed to facilitate the development
- Sedum Roofs

For the full list of BREEAM points being targeted refer to:

New South Glasgow Hospital -Main building detailed action list report BREEAM healthcare 2008

## WRAP

The project will also meet good practice levels of waste minimisation and management throughout the project in accordance with WRAP guidelines. By considering waste avoidance early in the design process and by adopting the most significant cost-neutral opportunities to increase waste recovery, waste levels will be minimised. Opportunities will be investigated under two streams:

- Reused and recycled content
- Site construction waste management and minimisation

The contract documents address the key documents referred to in the Planning Committee report:

- Energy Efficiency and Micromanagement: Achieving a Low Carbon Future
- A Strategy for Scotland the Scottish Government, March 2007
- SPP 6: Renewable Energy
- PAN 45: Renewable Energy Technology 2002
- PAN 84: Reducing Carbon Emissions in New Development
- BREEAM Healthcare
- The Targets identified in SPP 6 Renewable Energy

# 15.0
# Community Engagement

## Overview

A Health Impact Assessment (HIA) is a process that seeks to identify the potential –or actual – health and equity impact of a proposal on a given population. It aims to enhance the positive impacts of a proposal and to remove or minimise the potential negative impacts on health, well-being or inequalities that might arise or exist. These may include:

- Socio-economic
- Physical environment
- Social and community environment
- Individual or family lifestyles
- Fixed/ constitutional

An HIA is an impartial, systematic consideration of the likely health consequences of implementing a policy, plan, programme or project on a population and the distribution of effects within the population. NHS Greater Glasgow and Clyde is looking to use an HIA to assess the likely impacts of the design of the New South Glasgow Hospitals and identify ways in which the positive effects may be enhanced and any negative effects minimised.

An initial scoping exercise was held in July 2009 to engage communities in scoping the extent of the analysis to be undertaken and in appraising the impact of the design solution in relation to health. The findings from the scoping exercise have been fed into the project team for consideration in developing the masterplan.

Following a review of the scoping analysis, it was clear that the board had already undertaken a number of related impact assessments i.e. environmental, transport, socio-economic and that any future analysis should bring additionally to the process. Work is going with the Glasgow Centre for Population Health, Scottish Health Impact Assessment Network and Glasgow City Council to take forward the findings form the scoping exercise and design an assessment process to build on progress. It is anticipated that the assessment process will be completed in the summer of 2010.

## Community consultation -July 2010

A series of three focused workshops were undertaken in May/June 2010 to discuss aspects of the consented masterplan and the external environment. The workshop included a site walk through with the proposals to enable users to better understand the scale and character of the development, and feedback has informed the MSC submission.

Consultation with the local community is ongoing and will involve further workshops with focus groups. On July 19th 2010 a public consultation was held on site to give local residents a chance to see the latest design. Displays were organized for the 4 key aspects of the scheme: Masterplan, Transport, Building Design and Construction/Demolition (see photos opposite). Comments and feedback will inform ongoing design development.

## Inclusive design

The external hospital campus has been designed as a resource for the local community and hopes to attract residents irrespective of whether they are requiring hospital treatment. The parks are open to the community and hope to provide a much needed safe green space for parents to take their children. The children's park in particular fulfils a local need could become a much valued resource for families.

In addition the proposed small community managed orchard adjacent to the central park has already attracted interest from the Commonwealth Children's Orchard group whom will be consulted further with regard to species and orchard management as detail design progresses.

## Further information

For further detail on community consultation the following documents can be obtained:

## Introduction

This Landscape Management Strategy has been prepared to set out a broad overview of objectives and actions required for the ongoing management for the landscape of the New South Glasgow Hospitals grounds with a review of the resources desirable to secure the future delivery of outputs and the various levels of intervention required.

The landscape in the New South Glasgow Hospital is of considerable environmental, social and economic value, comprising a series of hard and soft, formal and informally designed landscaped areas, including; young woodland planting, ornamental shrub and herbaceous planting, wildflower meadows, and significant hardscape areas of civic and amenity open space. With this the landscape has great potential to meet a number of ecological, recreational and health benefits for both staff and patients. It is therefore crucial that the ongoing management of the space considers the requirements of the individual spaces within the wider context of the area.

Management of the New South Glasgow Hospital grounds will be delivered through a number of employed and voluntary organisations, groups and forums (personnel to be confirmed). These roles will evolve with the development of the area and responsibilities may change (or be novated) to another managing body at a later stage. This landscape management strategy should be used for guidance as a basis for long-term management by all parties and stakeholders concerned to ensure a holistic approach to management is achieved, and that delivery is consistent throughout in accordance with BREEAM requirements. By appropriately allocating resources, skills and expertise, the long-term sustainability of the development will be achieved.

## 1.1 Scope

This landscape management strategy considers the future landscaped areas of the New South Glasgow Hospital which are indicated throughout the accompanying landscape design strategies, Masterplan and detailed landscape plans. At the time of writing a number of design elements are as yet unconfirmed. Where this is the case assumptions and general guidelines have been provided.

## 1.2 Site Context

The footprint for the New South Glasgow Hospitals and their associated grounds date back to 1872, with further additions and expansions creating the site we see today. The recent development of the site considers an area of around 8.6 hectares within the overall hospital grounds which cover around 28.6 hectares in total. The site is located 500m south of the River Clyde to the south-west of Glasgow City Centre. The site's northern boundary is defined by Renfrew Road/Govan Road with the eastern boundary defined by Moss Road (Clyde Tunnel approach road). Langlands Drive and residential developments delineate the southern boundary and Hardgate Road runs north-westwards to identify the western boundary of the site.

## 2.0 Securing Management in Perpetuity

Landscape management roles and responsibilities are subject to change and this may affect the delivery and cost of the management operations. This will be addressed through frequent reviews of this management strategy, which will involve all management personnel and supporting groups. Sufficient time should be allocated by managers to programme reviews in.

## 2.1 Management of Financial Resource

The New South Glasgow Hospitals grounds will initially be managed by (**Management Body TBC**). The following sections summarises the basic management and maintenance requirements and the operative who will carry out specific operations.

| New South Glasgow Hospital Landscape Management Resource | | |
|---|---|---|
| **Organisation** | **Responsibilities** | **Comments** |
| Landscape Contractor(s) | **Routine Management Operations**<br>• Inspections and cleansing of all publically accessible areas. Frequency of visits will be determined by intensity of use (play areas, accessible roof gardens and ornamental landscaped areas will require greatest attention).<br>**Softscape Maintenance:**<br>• Mechanical weed control (in line with BREEAM)<br>• Formative pruning of shrubs<br>• Arboricultural inspections and remedial works.<br>• Amenity grass/rough grass / meadow grass mowing<br>• Swale maintenance (cleansing/inspection)<br>**Hardscape Maintenance**<br>• Treatment of hard surfaces (bound and unbound)<br>• General H&S checks of estate furniture<br>• Fencing integrity checks and repairs<br>• Repainting/staining of furniture (allowing for treatment on rotational basis). | All landscape maintenance work is carried out by mobile teams **(TBC)** |
| Outdoor Leisure Management team | • Estate wardening (including security, enforcement of byelaws)<br>• Managing of lettings (shops etc)?<br>• Recreational equipment management (staff/equipment/storage facility)<br>• Leading events/walks/educational services<br>• Youth Worker<br>• ROSPA Inspector (annual play area inspections). | A ranger could be based at the site forming part of a small team of site managers **(TBC)** |
| Property Services Team | • Exterior property maintenance, repair and replacement (café/toilet/Community garden shed etc and all associated hard landscaped features)<br>• Energy management<br>• Lettings for small scale businesses | Hospital Buildings are not included in this section. These buildings will be those which may generate monies to be reinvested into the landscape to aid ongoing management. |
| Strategic Development Team | • Sports development<br>• Play management<br>• Nature conservation team<br>• Access management<br>• Local business reps<br>• Cross cutting issues<br>• Parkland strategy and development | Includes both salaried and voluntary members, (Forums, Friends Groups etc). |

## 2.2 Financial resources – Projected Expenditure

At the time of preparing this report, the provisions for expenditure for the site wide landscape management was estimated at £**TBC** per annum.

## 2.3 Identification of Basic Landscape Maintenance Requirements

The following section provides the basic level of landscape maintenance expected for the Hospital grounds. These operations will vary in terms of intensity following the initial years of establishment.

**Cleansing and Inspections**

- Weekly site inspections (including production of written report) for all publically accessible landscaped areas, including all areas of hard and soft landscape, furniture….
- Twice weekly litter picks to all publically accessible areas.
- Sweeping hard surfaces, large mechanical sweeping of roads, large areas of hardstanding
- Emptying litter bins and dog bins,
- Arboricultural inspections (annual survey, H&S inspections).
- Waterbody inspection (waterside H&S, equipment, water quality, vegetation encroachment).

**Grass / Reed cutting**

- Formal amenity grass cuts (amenity lawn 15 cut and remove operations per year)
- Rough grass cuts / meadow grass /wildflower (1 -2 cut and remove operations per year)
- Cut and removal of riparian vegetation (cuts to be limited to 1/3 of vegetation at any one time, allowing arisings to stand for 24 hours before removal to habitat piles /compost facility).

**Repairs and replacements**

- Renovation of site furniture and paraphernalia. Frequency is informed by manufacturer's recommendations, but a minimum allowance should be made for a cyclical maintenance regime accounting for repairs/repainting programme of 1/3 of facilities on an annual basis (in areas of greatest use).

**Weed control**

- Mechanical weeding (only) of shrub beds and tree pits.
- Mechanical weed removal from hard surfacing (bound and unbound).
- Treatment of Japanese knotweed (regular inspections will determine whether this is still present). **Herbicide treatment would be required for this operation.*

**Pruning**

- Free-form pruning of ornamental shrub beds and trees (annual operation)
- Formal hedge pruning (annual operation)
- Cutting back / dividing herbaceous vegetation (annual operation following establishment)

**Newly Planted Trees**

- During establishment period, checking stakes, ties and reaffirm tree in pit where required. Replacements to match original specification.

## 2.4 Identification of Initial Staff Requirements

As the hospital campus develops and visitor numbers with it, the predicted number of permanent staff required for the landscape management will increase. The table below indicates the initial requirements (first **TBC years**).

| Onsite Staff required for landscape works (£ per annum exclusive of equipment and resources needed) | |
|---|---|
| Full time Grounds team - Number TBC | £ TBC |
| Site Warden(S) - full time worker | £ TBC |
| Community Events - part time (Voluntary position?) | £ TBC |

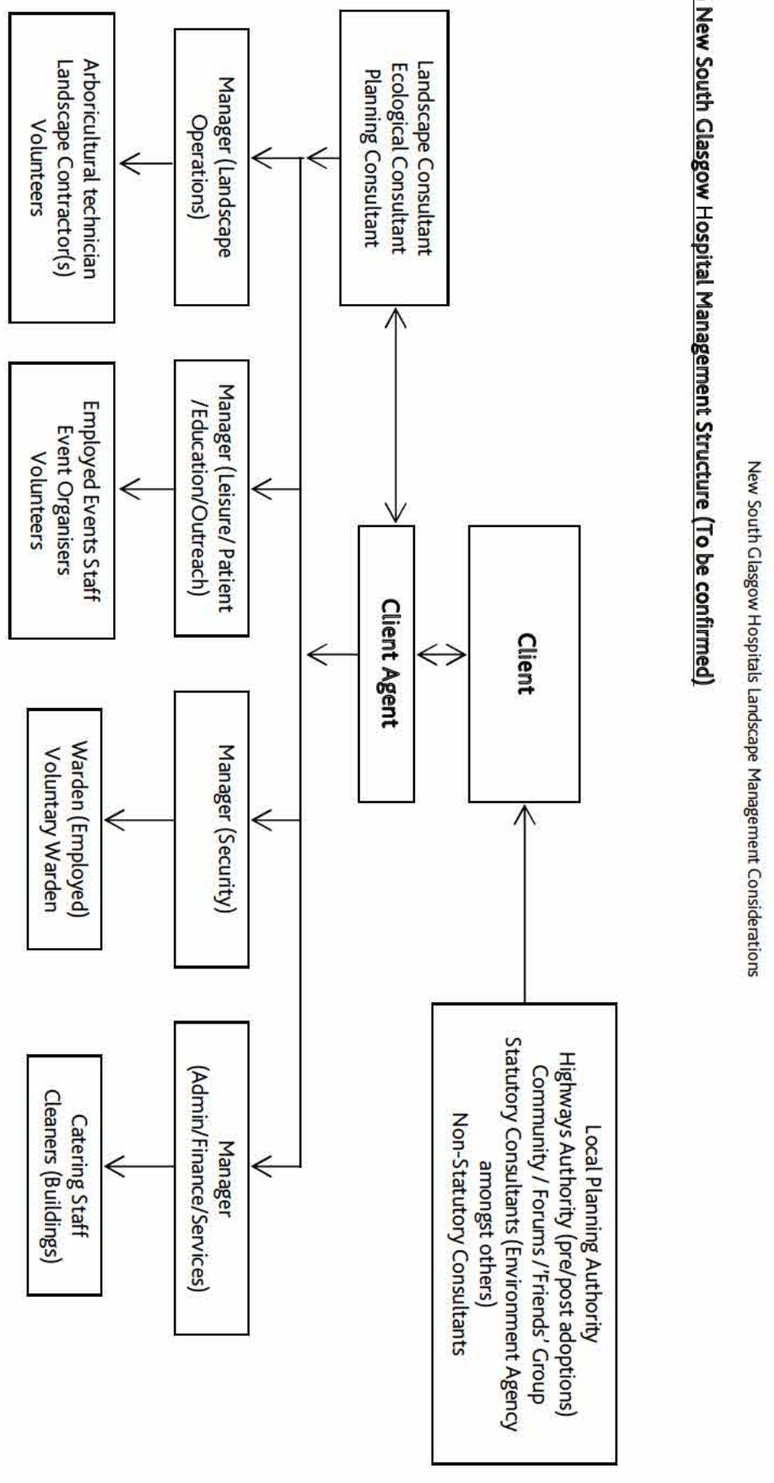
**2.5 Financial Resources – Projected Income**

The following figures provide a snapshot of the income generated within the park at the time at which this report was prepared:

| Projected Income from businesses within New South Glasgow Hospital to be reinvested in the landscape | |
|---|---|
| Café (%) | £ TBC |
| Business Lettings | £ TBC |
| Youth Services | £ TBC |

| Potential Income from Social Enterprise to reinvest into landscape works | |
|---|---|
| Community Markets/Community Orchard Fruit Stall | £ TBC |

**2.6 New South Glasgow Hospital Management Structure (To be confirmed)**



## 3.0 Aims and Objectives

- To maintain a low impact, holistic approach to site management, consistent in delivery and flexible to changing site demands;
- To efficiently manage a low maintenance, minimum waste landscape;
- To adapt management in accordance with the changing needs, requirements, desires and legal and BREEAM requirements;
- To establish a strong marketing campaign to attract investors and strong community support;
- To engender a strong sense of character through a high standard of management;
- To promote the understanding of the value of the landscape to its users by building links with the community and the installation of information boards;
- To promote biodiversity within the scheme wherever possible.

## 4.0 Site Appraisal

The site includes a number of clearly defined environments, each with specific management approaches needed in response to their intended level of use.

### Hospital building Entrance Plaza

The hospital entrance plaza is of area facilitates safe and easy access into the hospital building from the car park /bus and ambulance drop off. This area should be maintained to a high visual standard and provisions should be made to target this area as a priority for maintenance operations.

### Active Areas of Recreation and Play

The Children's Park and Central Park (amenity areas) provide areas of formal play for a range of users and age groups whilst residing in the hospital grounds. Again maintenance requirements for these areas are substantial so as to create a safe and accessible environment. Certain areas may see controlled access during certain hours of the day to retain greater control of use. An annual evaluation of current usage (based on frequent site reports by maintenance operatives) as well as a review of annual expenditure will determine the need/scope for additional/replacement facilities. Future assessments can determined the scope for providing official training grounds for local teams (potential revenue). This could be approached with a review of available grants.

### Areas of Passive Recreation and Recovery

External enclosed courtyards form protective environments for recovering patients. These areas provide simple terrain for patients to use for passive recreation with an ornamental landscape and supporting furniture and paraphernalia. The protective nature of the space combined with views looking in will ensure the space is not subject to mistreatment and should lower unforeseen maintenance issues, though a high level of input is still required to ensure the space is easily used by all.

### Interlinking/Transitional Areas of Paths Roads and Car Parks

These areas include, road infrastructure, pedestrian paths, linear walks and cycle routes which serve to facilitate access between the hospital buildings, parkland and surrounding environment. The maintenance of these areas will focus on maintaining ease of site access, which will include reviewing and updating wayfinding information, maintaining road/cycleway delineation markings and maintaining site lines through vegetation management in addition to general site cleansing and inspection operations.

### Roof Gardens

The roof gardens provide a safe retreat away from the busy hospital environment. These user environments will be subject to climatic variations and exposure at an increased level and management must respond accordingly. Maintenance here will reduce following establishment though initial input will be higher (including the need for controlled irrigation).

### Habitat Areas

The increase in site biodiversity will support a number of new habitats, more 'wild' in character and providing shelter for invertebrates and fauna, with green corridors linking to the wider green network in the local area. These zones will be largely inaccessible to site users through use of dense native vegetation and maintenance will consider local BAP and management guidance. A review of successful establishment of these areas will determine an approach for encourage the local residents to assist with further habitat creation and management.

### Community Orchard

The proposed Community Orchard is an area of site managed collectively by a group of people (staff, patients and local community). The Likely uptake of this area is to be discussed further. At a minimum managers need to consider a base level maintenance operations to maintain a desirable standard where required. Maintenance requirements will reduce as a result of community input, but a contingency should be in place to ensure standards do not drop below a given level. Successful uptake could eliminate any maintenance input from grounds staff. Further links with surrounding projects in the future may help to increase interest and raise the profile of the scheme leading to further projects in and around the hospital grounds, promoting a more healthy way of life.

## 5.0 Landscape Management Recommendations

This section details the general maintenance requirements for all landscaped areas within the site boundary. Frequencies of operation for each element are also provided in the accompanying tables.

### Cleansing
A general scavenge of all public areas should be conducted on a frequent basis (timing to be confirmed but as a guide, frequency will vary according to perceived intensity of use for each area) and immediately following periods of bad weather, as excess litter and debris may have been blown/washed into the site.

'Cleansing' should consist of the routine collection and removal of all litter and debris as described below to the Contractor's tip. Litter should include; paper, wrapping material, glass, metal and plastic, with no lower size limit. Other debris should consist of bricks (greater than ¼ brick size), stones (greater than 100 mm in any dimension), concrete, bottles, cans, tipped material, garden refuse (not including leaf litter), grass cuttings, all prunings, dead trees, small or broken furniture, household effects, dead animals, and any other materials whatsoever their composition and by whomsoever deposited, that the Site Manager considers detrimental to the appearance of the site. Dog faeces shall be cleared from all areas by the Contractor. Litter and debris lodged in hedges, fences and trees shall be removed as part of the cleansing operation.

### Fly tipping
Fly tipping may occur from time to time and an allowance should be made to remove this as quickly as possible after it appears.

### Vandalism (Generally)
Any damaged items should be replaced or cleaned as quickly as possible, as experience has shown that damage left untreated will tend to encourage further mistreatment.

### Inspections
Regular patrols of the site (weekly/ fortnightly/monthly) will be undertaken to monitor use/abuse, to identify any problems or conflicts that may arise with regards to the landscape development and general health and safety issues that need addressing. Superficial inspection from a distance is not acceptable and the site requires coverage by walking. The inspection shall be carried out independently of any routine maintenance works which may be in progress. The contractor should use a site inspection sheet making specific notes on site maintenance issues.

### Weekly inspections
Site inspections in areas if high intensely use are to be carried out on a weekly basis and inspection reports should be compiled and provided to the contract administrator, identifying any management issues relating to the landscape within or on the boundary line. Inspections should cover the following:

- Landscape maintenance issues (resulting in an inability to undertake landscape maintenance operations).
- Cleansing issues (repeated littering, fly tipping, facilities)
- Repairs required for all hard landscape elements, site features, furnishings and safety equipment
- Assessment of any potential hazards (waterside H&S, trip/slip hazards)

### Annual inspections
An appropriately qualified Arboriculturalist should carry out an annual inspection of all trees within or adjacent to areas of public access. These assessments should check for damage and disease to ensure that the tree is in a safe, sound condition, to permit free access and maintain appropriate height clearances for pedestrians and vehicular access.

Annual inspections should be undertaken to assess the condition of structural elements such as retaining walls. This inspection should also include a condition survey of all road markings, railings and site furnishings which inform site managers of work priorities for the upcoming year.

### Tree Planting
#### Individual mature trees

It is recommended that an appropriately qualified Arboriculturalist should be commissioned to carry out annual inspections of any individual mature trees within or adjacent to areas of public access in order to maintain public safety and permit access. In addition, any remedial arboricultural work should be undertaken whenever required in order to ensure the longevity of the tree and the health and safety of the site users. Where Tree Preservation Orders (TPO's) are in place, the local planning authority must be consulted prior to undertaking any remedial works, including any topping, loping, crown shaping and/or limb removal. Any trees accessible to the public should be crown pruned as required to maintain healthy growth. Allowance shall be made for thinning, trimming and shaping according to species, variety, season, stage of growth, and required visual effect. All prunings/thinnings are to be removed offsite unless otherwise instructed. All landscape management staff should record any incidences of any disease/fungus found during site inspections.

When trees are ultimately felled, replacement planting should be of the same species, or at least of a native long-term deciduous species to maintain a diverse age structure. Standing deadwood should be retained onsite wherever possible to enhance ecological diversity, but only where visually appropriate and where access should not be compromised.

#### Individual young specimen trees

Where trees are staked, the stakes and ties should be checked frequently and it is anticipated that they should need adjusting at least twice annually. To reduce excessive competition a suitable mulch should be laid around any trees less than 3m in height and should be maintained to a diameter of 1m around the base of the trees. This should be topped up during the first three years of management as required to maintain a depth of 75mm. Between April and September frequent inspections should be undertaken, and undesirable weeds should be removed by hand weeding. Young trees should require formative pruning to maintain a desirable shape as well as to maintain health and vigour. Any broken or damaged stakes should be replaced and ties re-fixed at a slightly lower position, allowing for growth since planting. Remove stakes as necessary, when the tree is suitably established.

Once young trees attain a height of at least 4m, the maintenance of a mulch layer and formative pruning can be discontinued. However, crown pruning is still desirable and any dead or severely damaged trees should be felled and replaced accordingly.

### General Arboricultural Operations
The following specifications are applicable to all arboricultural works onsite.

a. An appropriately qualified operative such as Arboriculturalist or Tree Surgeon must be consulted prior to undertaking any major tree works within the site boundary.
b. Formative tree works must be undertaken during the winter months (preferably January – February) outside of the bird-breeding season.
c. Where bat roosts may be present, tree works must be authorised and supervised by an appropriately qualified ecologist.
d. Wood under 250 mm diameter collected from thinning, brashing, or coppicing should, wherever possible, be chipped and used on site for mulching, either by blowing directly back into planting areas or by storing on site for future use.
e. Trees for coppicing should be cut back to 50 mm above ground level. Where a number of stems are coppiced on one plant, cut faces are to slope away from the centre. Care should be taken to ensure that thinning operations do not cause damage to desirable plants, or rutting of the ground in wet conditions.
f. Trees for thinning should be cut to a level stump length of 150 mm for treatment with stump killer. A minimum of 50% of the stump surface should be scored over and treated to stop re-growth. Future growth of stumps should be monitored and additional cuts and applications of stump killer should be made over the following two or three years as required.
g. The removal of a particular branch or limb, for whatever reason, might leave the overall appearance of the crown unsightly. Steps may be required to soften the impact of the works required by judicious pruning

of other, adjacent, parts of the canopy to ensure a healthily balance is maintained. Judgements should be made on an individual basis and should consider the individual species concerned to maintain the trees natural form.

h. Epicormic shoots resulting from limb removal should be removed where appropriate.

### Weed Control

Within the first ten years of establishment (or until canopy layer closes) wood chip, bark mulch or leaf litter (collected from surrounding amenity areas) should be laid around the base of young plants to suppress weed growth. Between April and September periodic inspections of these areas should be undertaken and weeds within 0.5m of young trees should be removed by hand weeding to help tree establishment.

### Rabbit Guards, Stakes and Ties

Monthly inspections of rabbit proof guards should be undertaken during the establishing period of the tree planting and replacements should be made as necessary. Replacement guards should use the same spiral guards as those originally approved and supplied. Remove guards once tree planting has established, in order to facilitate growth.

### Hedge Cutting

Initial formative hedge cuts to young hedgerows should be undertaken once it has reached a sufficient stage of growth so as to establish the desired height and width of the hedgerow for future maintenance cuts. Initial cuts should be undertaken using appropriate hand or power tools. Once hedgerows have reached sufficient maturity they shall be cut once a year unless otherwise instructed.

### Ornamental Planting: Shrubs, Herbaceous Planting

With respect to the management of the ornamental shrub planting beds, the approach here should focus on maintaining a neat and tidy appearance, which should also encourage plant growth. Any failed plants during the 3 years covered by this management plan should be replaced as required using like for like species and using the planting list provided for guidance.

### Weed control

Within the first three years of establishment, a mulch should be laid around the base of all young plants to suppress weed growth and should be maintained to a depth of 50mm. Between April and September frequent inspections of these areas should be undertaken, removing weeds wherever necessary by hand pulling to assist the successful establishment of plants.

Pruning of ornamental shrubs should be undertaken in order to clear deadwood, promote healthy growth and produce desired growth of flowers, fruit, foliage or winter colour as appropriate. Pruning should also include for clearing out crossing and damaged branches. Where the pruning is limited to the extent of the current year's growth, work can be carried out at anytime of year. Extensive pruning works, thinning or coppicing works should however be carried out outside the bird nesting period e.g. between September and February.

### Watering of Trees

Watering of young trees and ornamental shrub/herbaceous planting might be required during periods of prolonged drought (in excess of 14 days) in the first 2 years of establishment. Particular care should be taken during such periods to ensure sufficient watering is carried out to facilitate healthy growth. Watering should not take place where local water restrictions are in place.

### Bulb Planting

Areas of bulbs should not be cut until the leaves have died down in late June/July (dependant upon species present). Thereafter routine cuts to bulbs in grass should be undertaken in concurrence with the surrounding formal grass cutting regime.

### Ornamental Grasses

Ornamental grasses should hand cut between late January and early March as required in order to clear dead vegetation, and promote healthy re-growth. Care must be taken not to damage new growth. All arisings should be collected and removed.

### Grassland

### Amenity grassland

These areas are scattered throughout the development areas. These areas serve both an aesthetic and passive recreational purpose. The focus of the management approach in these areas should be to maintain a neat and tidy appearance which facilitates public use.

Grass cuts should be undertaken as required to maintain a neat and tidy appearance throughout the growing season (minimum 15 times per annum). Herbicide weed control should be limited to spot application of translocated herbicide to control persistent and noxious weeds such as docks, thistles, nettles, ragwort and shouldowherb during periods of active growth. Application should be at the manufacturer's recommended rates, as a spot-treatment to undesirable species or a blanket treatment where infestation is severe.

Any areas to be re-seeded as general amenity grassland should be seeded with a mix approved by the Site Manager.

Where considered visually appropriate (informal areas only), retain any arising for composting onsite.

### Wildflower Meadow

The wildflower meadow is important for providing valuable wildlife habitats for insects, invertebrates, small mammals and birds. Whilst conserving wildlife habitats, the management of this grassland should ensure that species diversity is enhanced in the long-term and that invasive species are not permitted to compromise the integrity of the grassland.

The suggested timing and frequency of grass cuts aims to maximise the conservation benefits provided by the meadow. Management should include a twice yearly cut and remove of all arisings to help maintain lower levels of soil fertility. As with amenity grassland areas, herbicide weed control should be limited to spot application of translocated herbicide to control noxious and invasive weeds such as rush, dock, thistle and nettle.

Any re-seeding of the Meadow Grassland should comply with the original landscape design unless otherwise instructed and approved.

When undertaking grass cutting operations on roof gardens, a method statement for working at height should be provided to the Site Manager for approval.

### SUDS

**NB: SUDS and management proposals to be submitted as a separate application in August 2010.**

### Swale Planting

Maintenance of marginal vegetation within the swale should include cutting back invasive species to prevent them from dominating. Regular removal of dead vegetation and litter, should ensure the swale does not dry out and that the drainage in the area is not compromised through natural succession. It is important that cutting does not take place over the entire swale in one operation, and should therefore be cut in alternate sections on annual rotation leaving uncut areas as refuge for wildlife. Management must also consider the weather conditions at any given time as the swale is likely to dry out during periods of prolonged drought. Consideration should be given to watering these areas if it is deemed necessary.

## Japanese Knotweed

Japanese Knotweed has previously been discovered in the northern section of the site. This has significant management implications as Japanese knotweed is classified as an invasive weed in the Wildlife and Countryside Act 1981, under which Schedule 9, Section 14 makes it an offence for anyone to knowingly allow the species to spread.

Where Japanese Knotweed is identified on site (seek advice from Ecological consultant if unsure), one of the following control strategies should be undertaken. The type of control strategy to be undertaken should be determined by the Site Manager and is dependant upon the current or future usage of the area in question

Before or after spraying, cut Japanese knotweed within 100-150mm of ground level using strimmers, hand tools or mechanical mowers. Cut stems can then be retained in situ where they should be treated with subsequent herbicide control.

Arisings of cut Japanese knotweed may alternatively be disposed of by one of the following methods:

## Removal to landfill

All contaminated material should be loaded directly onto wagons for removal to a licensed landfill. Before leaving site, the wagons should be sealed using tarpaulin covers. The contractor should provide all tip weighbridge receipts for the attention of the Site Manager. At the end of each working day all machines used for excavation should be brushed clean to ensure that no soil leaves the site. If required, a representative of the Site Manager should note the time of departure and registration of each wagon for checking against authentic tip weighbridge receipts in order to demonstrate that the material has been removed in accordance with the EPA (Duty of Care) Regulations 1991. High costs are generally associated with off-site disposal. It is advisable to check with the relevant landfill operators as some may not be willing to accept Japanese knotweed contaminated material. As the material is classed as a controlled waste, all producers, carriers and disposers of waste must be in possession of relevant licences. Material must be appropriately covered during transit in order to minimise additional contamination.

## Treatment of Japanese knotweed with non-persistent herbicide containing Glyphosate

Three glyphosate applications are to be undertaken at a minimum of six weekly intervals between May and September (i.e. in May, July and September) or as instructed by the Site Manager.

Application is to be undertaken as a foliar spray when shoots have fully open leaves and are in active growth. The spray must not be permitted to contact desirable plants. Where Japanese knotweed is within vegetation to be retained or where small amounts of re-growth are present, spot application of glyphosate using a suitable method is to be substituted. In some areas, specialised application methods such as telescopic lances may be required to achieve good spray coverage. Where spraying of flowering Japanese knotweed is required spraying should be undertaken in late evening.

If Japanese knotweed vegetation is over approximately 1.5m tall, or obscured by tall dead stems making a thorough application impossible, vegetation is to be cut prior to herbicide application and left in situ. The Glyphosate is then to be applied after regrowth of shoots has established fully open leaves. Once vegetation has died back fully, and no later than the first emergence of new shoots, standing vegetation is to be cut and retained in situ, to be treated again by subsequent herbicide application.

## Hardscape

There are numerous hard landscape elements on site including bound and unbound tracks, paths and roads as well as furniture, including; benches, bollards and cycle racks. It is important that these features are

appropriately maintained to retain their respective functions and aesthetic properties. Fencing in and around the site perimeters should be regularly inspected and repaired promptly to prevent uncontrolled access.

All hard landscape elements including fencing, furniture, gates, access barriers and hard surfaces are to be inspected on a regular basis and minor repairs carried out as necessary. Any items considered to be unsafe should be removed or made safe and replaced as soon as possible. Surface integrity should be closely monitored to prevent slip and trip hazards, through surface cracks or vegetation encroachment. Gullies should be kept free of debris to maintain surface water drainage.

### Hard surfacing generally

The management of all hard surfacing throughout the site must seek to maintain a formal, tidy appearance which is safe to all users, free from any potential slips or trip hazards and free from sharp debris. Weed control should be undertaken between four to six times per year as required during the growing season, and should involve hand weeding and spot treatment of glyphosate to control the growth of any deep-rooted noxious weeds. Weed control to areas of bound surfacing is likely to be limited to perimeters of the surfacing whereas a higher percentage of weed control should be required to unbound and paved surfacing to eradicate weeds throughout the area. Moss should be cleared from hard surfacing when required by hard brushing and removing the subsequent arising. Sufficient maintenance access (vehicular/pedestrian) should be maintained at all times.

### Cycle Route Markings

Thermoplastic markings along cycle tracks should be review as part of regular site inspections. Allowance should be made for an annual application of the markings to 1/3 of the total length from year 2 onwards.

### Retaining Walls

Management of retaining walls should ensure the continued structural integrity of the materials, making sure surfaces are hazard free and that the structure remains intact. Any slumping/damage to the walls should be reported immediately.

### Cycle Stands, Bollards and Paraphernalia

Any equipment that has been damaged or considered to be unsafe should be replaced or made safe and replaced as soon as possible. The use of materials for re-painting, repairs and replacements should conform to the original design specification for external works.

## Management Initiatives

### Training

The site's potential for training purposes should be explored. Training may range from opportunities for local students with a professional interest in environmental management to both general skills and specialist training through the employment of Intermediate Labour Market (ILM) teams to undertake aspects of the management. The objective should be to work with existing local providers, using the site as a venue for their activities, developing their capacity and expertise rather than developing something separate.

### Social Enterprise

As well as the potential to use local ILMs the potential to use and develop local social enterprises should also be explored, helping to ensure that the local people and communities benefit financially from the sites as well as in other ways. Again this should be developed in partnership with existing local deliverers.

### Other

Means of engaging local people more proactively in having a say in the management of the site should be explored, including the setting up of a 'Friends Group' and volunteer wardens. However, it must be

recognised that such involvement must spring from a genuine desire and commitment on behalf of local people and cannot be forced upon them. In addition, although beneficial it can also be time consuming to manage and is not a way of managing more cheaply. As the site is an active hospital site, it is recommended that such groups be targeted towards developing the lower intensity use areas and habitat areas rather than the high intensity entrance areas and forecourts.

## 6.0 Community Engagement Initiatives

The Project Team and the Board's Community Engagement Managers have established the required community benefit considerations for incorporation in the procurement of the Project. These have been developed in line with the Scottish Government's Guidance on Community Benefits in Public Procurement. In particular the Board should seek to work in partnership to develop initiatives around the following:

- Targeted recruitment & training;
- Developing Small and Medium Enterprises (SMEs); and
- Developing Social Enterprises.

### 6.1 Voluntary Workers

These should be considered in the following categories:

- **Casual** – Frequent park users who simple want to help out with the management of the area.
- **Corporate** - Many companies have corporate responsibility targets which could involve having an activity involvement in the local environment.
- **Organised volunteers** – These include; local school, Duke of Edinburgh groups and other such organisations.

The management team should establish a timeline for engaging the community at a variety of levels and assisting with the creation of community led groups. This could include:

- **Environment management events** – Run by onsite staff. Volunteers pay a nominal fee for taking part which pays for resources for the day. Could include:
  - Installing and monitoring habitats (bat/bird boxes, hedgehog boxes etc).
  - Bulb and plug planting days
  - Wildflower seed collection and sewing to be reused elsewhere onsite for experimentation and habitat creation
  - Woodland works (coppicing, scrub clearance and hedge laying)
  - Creation of 'Land Art' by simple variations in maintenance regimes.
  - Allotment development and links with nearby projects and associations.
  - Establishing links with surrounding developments, pooling resources and holding joint social events to aid community integration.

- **Voluntary workers** – This could include part-time patrolling (a well known and respected member of the local community should be approached to champion this as this should help to encourage responsible behaviour). Summer work for school kids, including working in the shop etc.

- **Education Events** – Local forum members could provide educational events on their areas of expertise. Establish group ASAP. Participants pay nominal fee for taking part. Social events for children may be developed and run largely in the school holidays, with educational activities planned during term-time. Weekend events such as guided walks and health walks could be developed and run throughout the year. Establishing a contact at the local primary and secondary schools should be crucial to achieving success in this area.

- **Training** - Opportunities for students with a professional interest in environmental management and specialist training for site workers, working with local experts/ranger etc. This could provide an opportunity for a part-time voluntary Ranger.

- **Social Enterprise** - Helping the local community to benefit financially from the site. Again this could be developed in partnership with local deliverers. The Community garden could form a basis for this and a vegetable box scheme should be considered.

- **'Friends' Group** - A number of precedent projects across the country have established 'Friends Groups' early in their development to gain a level of community support during the establishment period. This should be explored further and links with other developments in the surrounding area should be considered to establish a network of supportive groups.

## 7.0 Marketing

Marketing the park should be focused towards raising the general profile of the grounds. A number of techniques could be incorporated to achieve this, including;

- The development of a website
- Production and distribution of promotional material for events, business opportunities amongst others
- Suggestion of events to raise profile (an assessment needs to be made by the management teams as to who is responsible for organising internal and external events)
- The organisation of local forums

## 8.0 Management Targets

Following on from initial establishment of groups (including the management body), the team should outline and identify a series of management targets for the first year. This should be considered at a variety of levels of intervention, including;

| | |
|---|---|
| **Minimum** | All necessary works/changes following annual site review |
| **Medium** | Covers all basics requirements and some aspirations |
| **Maximum** | Implementation of large scale proposals and developments (in addition to minimum and medium intervention) |

## 9.0 Monitor and Review

This management strategy should be considered when producing future management plans as well as subsequent revisions, which maybe created for the Hospital grounds. It may also be necessary to re-assess and update this strategy upon final completion of the individual landscape zones indentified in the Site Appraisal Section. It is recommended that landscape management operations are reviewed on a **five** yearly basis in order to ensure they are meeting the overall aims and objectives identified in this strategy and to ensure that it is responding to the current and perceived future needs of the site as it develops. This can be facilitated by undertaking site surveys, which should identify the need for additional operations and inform future management decisions in relation to continual improvement of bio-diversity and the amenity value of the landscape.

## 10.0 Potential Funding opportunities

**FUNDING OPPORTUNITIES**

The following opportunities could be explored for the provision of further funding for the development and future management of the New South Glasgow Hospital.

***Big Lottery Fund***
This was launched in June 2004 as a single new lottery distributor combining the New Opportunities Fund and the Community Fund. The fund should continue to provide for charities, the voluntary sector and health, education and environment projects in addition to large-scale regeneration projects. A key theme is "promoting community safety and cohesion", and aims to encourage people to become actively involved in their local communities. Other goals include enhancing the urban and rural environment to make public places safer, and better designed/maintained whilst enabling communities to tackle local environmental problems.

The following Big Lottery funding streams could be explored if the 'Living Landmarks' Big Lottery application if unsuccessful or to fund projects not covered by the 'Living Landmarks' application.

***Young Peoples Fund*** provides grants of up to £200,000.00 for projects that should improve local communities and offer more opportunities to young people. In particular it aims to encourage the involvement of young people from disadvantaged backgrounds. Applications are open to voluntary and community organisations.

***Children's Play Initiative*** has funds of £155 million to be delivered in areas of deprivation. Funding streams include:

- *Playful Ideas Programme*: provides capital and revenue grants of £10,000-£250,000 for projects lasting up to five years. Projects must focus on innovative and new ways of providing for children's play. Applications are open to voluntary and community groups, the social enterprise sector, and town and parish councils.
- *Play England Project*: £15 million partnership between the Big Lottery Fund and the Children's Play Council. The Play England Project is available to provide advice and support to both local authorities and the voluntary and community sector.
- *Children's Play Programme*: £124 million programme open to applications from Local Authorities. The amount of money allocated is based on the areas child population and level of deprivation. Local authorities are required to develop a local play strategy as part of the application process. Applications should comprise a portfolio of projects.

***Reaching Communities*** £60 million for 2008-2009 for projects which improve the quality of life of communities most in need, aiming to:

- improve access to training and development of life skills
- improved rural and urban environments
- develop stronger communities

***Changing Spaces*** has £234 million available to help communities in England improve their environment focussing on community spaces; local community enterprises and access to the natural environment. BIG is currently appointing Award Partners to manage grant schemes on their behalf and deliver a 'portfolio of projects' which comprise of a number if individual projects which together form a cohesive strategy. Applications are open to Voluntary, public or private sectors.

*Heritage Lottery Fund*

*Awards for All* provides grants of between £300 and £10,000 for people to take part in art, sport, heritage and community activities and projects that promote education, the environment and health in the local community. Not-for-profit groups, parish or town councils or public bodies can apply. Eligibility is assessed on the following criteria amongst others:

- evidence of having successfully undertaken similar work in the past
- the project meets aims to extend access and participation, increase skills and creativity and improve quality of life
- appropriate and realistic budget
- identification of the community benefits

*Parks for People* is funded by Big Lottery Fund (BIG) and Heritage Lottery Fund (HLF) and provides grants of £250,000-£5 million available for projects involving urban or rural green spaces designed for informal recreation and enjoyment – usually those owned and managed by a local authority. Not-for-profit organisations can also apply. Applications must show that:

- The local community values the Park as part of their heritage;
- The parks meets local social, economic and environmental needs; and
- The park actively involves local people.

Applicants are required to raise at least 25% of the project costs from other sources and at lease 5% of partnership funding must be from their own resources. Deadlines for applications are 31 March and 30 September (annually).

***Your Heritage*** provides grants of between £5,000 and £50,000 to support community-focused heritage projects. Projects must conserve the heritage and should provide educational and recreational benefits. Projects include caring for the natural landscape, conserving historic environments.

*Heritage Grants* offers grants of over £50,000 for projects which conserve and enhance local heritage and/or encourage community involvement and education of their heritage. Projects can include nature conservation and projects relating to the UK's industrial transport history amongst others.

***ODPM Funding***

*Biffa Award*
Up to £50,000 available for projects showing innovation, community involvement, and partnership with relevant groups and meet targets set out in the Government's strategy: 'A Quality of Life'. Projects include amenity projects to improve access and biodiversity projects to restore and manage areas specifically for biodiversity. Applicants must be enrolled as an environmental body with Entrust.

Barclays Spaces for Sports
Barclays, in partnership with the Football Foundation and Groundwork provide capital grants of up to £25,000 for new or renovation of existing sports facilities. Applications are made through Groundwork Trusts and the Football Foundation.

***Corporate Sponsorship***

Local businesses are often keen to provide sponsorship for various forms of artworks, events and promotional material which they see as a marketing opportunity, particularly where the applicant can demonstrate links to their company objectives. Many companies have funds designated specifically within their Corporate Plan for community projects.

*Voluntary and Community Sector*

The voluntary and community sectors are able to access various sources of funding, particularly for capital works. The VCS, supported by the local authority can also provide skilled people to help manage and maintain the environment, run events and activities, and raise funds. It can, for example, provide resources to support 'friends of' groups and match-funding for projects and maintenance activities. Partnerships should be established with organisations such as BTCV, Groundwork and the Wildlife Trust to maximise opportunities for such funding.

## 11.0: Environmental, Social and Legal Considerations

The following section provides a summary of the principal constraints and considerations to be taken into account when implementing this and subsequent management plans. It is not an exclusive list and consideration must be given to changes in government legislation at any given time.

### 11.1 Compliance with Environmental Legislation

The following legal and non-legal obligations, among others have to be considered in carrying out any management operations:

The Health and Safety At Work Act 1974:
All operations carried out on site must only be undertaken by trained personnel, using methods and equipment approved by the Health and Safety Executive.

Working at Height Regulations 2005 (as amended):
A risk assessment must be undertaken prior to any working at height (including Arboricultural operations over 4m or where a ladder is required to carry out works).

Wildlife and Countryside Act 1981:
There is an obligation to comply with legislation for UK species protected (including amphibians, reptiles and bats) under this Act. Of particular relevance to the Wildlife Conservation Area is legislation relating to great crested newt, lizards and bats.

Occupiers Liability Act 1984:
The Occupier's Liability Act imposes an obligation on the chosen management organisation to ensure that every reasonable care is taken to remove any risks to both legitimate visitors and to any trespassers on the land. In compliance it should be necessary:

a. To make sure that all stiles, footpaths and any other structures are safe.
b. To remove any hazardous objects.
c. To conduct an annual safety audit in order to identify any further hazards.

Protection of Badgers Act 1992:
The Act provides legal protection of badgers and their setts which, amongst other things, makes it illegal to:

a. Disturb a badger when it is occupying a sett;
b. Intentionally/ recklessly damage, destroy or obstruct access to a sett;
c. Wilfully kill, injure or take any badger or attempt to do so.

The Conservation (Natural Habitats etc) Regulations 1994:
There is an obligation to comply with legislation for European species protected under these regulations, notably great crested newts.

Environmental Protection Act 1990:
There is an obligation to keep the site free from litter and refuse.

Countryside and Rights of Way Act 2000:
The CROW Act imposes a new right of access on foot to registered common land and other areas of 'open countryside' which under certain circumstances allows access without being confined to footpaths. It also increases the protection of great crested newts introducing the new offence of a 'reckless' act affecting great crested newts.

Other Relevant Legislation includes:

- Alcohol Consumption in Public Places Order 2003
- Clean Neighbourhoods Act 2004
- Control of Pesticide Protection Act 1986
- Countryside and Rights of Way Act 2000 and increments
- Countryside & Right of Way Act 2000
- Disability Discrimination Act 1998
- Health & Safety at Work Act 1998
- Litter Act 1983
- Ministry of Housing and Local Government Provisional Order Confirmation (Greater London Parks & Open Spaces Act )1967
- Occupiers Liability Act 1957
- Road Traffic Act 1988 (as amended 1991)
- The Country Code (2004)
- The Anti Social Behaviour Act 2003

### 11.2 Environmental Factors

*Invasive species*
Japanese knotweed has previously been recorded onsite and it is important that management continues to monitor for the occurrence of invasive and noxious species such as Japanese knotweed, Giant Hogweed and Himalayan Balsam and ensure that appropriate programmes of monitoring, reporting and eradication are implemented as required.

*Control of natural succession*
Habitats should require ongoing maintenance works to protect them from scrub invasion and over-enrichment which may otherwise result in a loss of terrestrial or aquatic habitat. This must remain consistent with the local Biodiversity Action Plan prepared in partnership with local and regional groups.

*Control of introduced problem species*
The introduction of fish to waterbodies through illegal or unintentional activity (e.g. by children) is a threat in publicly accessible waterbodies which must be closely monitored to protect amphibian habitats.

*Sensitivity of wildlife habitats*
NB: Policy to be developed in tandem with SUDS management proposals to be submitted as a separate application in August 2010.

Any maintenance works to be undertaken within close proximity to any badger setts found (e.g. 10m) are to be undertaken in accordance with UK guidelines.

*Climate Change*
Future development and management proposals need to reflex climate change objectives. Management practice should remain mindful of government initiatives and legislative changes. Programmes should be adapted accordingly, whilst ensuring operational targets are met.

*Water Demand*
The contractor must consider local water restrictions which may have been imposed during periods of prolonged drought. Watering operations must cease during this time.

## 11.3 Social Factors

***Pollution***
Urban run-off from the building and car parks should be discharged into the swales via a Sustainable Urban Drainage system. Reed beds should act as a filtration system, however proposals for pollution control measures should be finalised as part of the detailed design proposals.

***Public Amenity***
The balance of both wildlife conservation and public amenity interests must be carefully managed due to the close proximity of the built environment and public open space. In addition to providing valuable wildlife habitat it is important that designated ecological and wildlife conservation areas continue to provide an attractive setting for the adjacent amenity open space and residential development.

***Public Access***
The site must be monitored for signs of unofficial public access and the potential development of desire lines. During any additional construction operations, public access should be clearly defined in the interests of public safety. Temporary diversions must be clearly defined and signage should be provided explaining the need for the diversion, alternate routes and likely duration of the diversion. This should be overseen by the landscape management team.

Undesirable behaviour (e.g. vandalism and the threat to habitats) should be monitored, dealt with and taken into account when planning any future management initiatives. Irresponsible behaviour by members of the public in accessible areas or trespassing in restricted access areas has the potential to create management requirements that may require enhanced levels of staffing.

***Trades Access***
Trades access should be catered for around shops etc. Unauthorised access should be monitored and mitigated where required. Management staff should report any unauthorised access.

***Health and Safety Issues***
Public health and safety must be considered at all times. In particular this should relate to presence of trip hazards, sightlines, air quality and condition of equipment within areas of public access.

***Compliance with wider area initiatives***
The implementation of this management plan and future revisions should acknowledge the implementation of local, regional and national initiatives to which the management plan may contribute.

## 12.0 Frequency Tables with Approximate Costs

| Action | Approximate Measure/ Quantity | Unit | No of ops/year | TIMING (MONTH) A | M | J | J | A | S | O | N | D | J | F | M | Unit rates (£'s) | Approximate Annual Costs (£'s) | Comments |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| **SITE INSPECTIONS** | | | | | | | | | | | | | | | | | | |
| Undertake weekly inspections | 14,000 | $m^2$ | 52 | 4 | 5 | 4 | 5 | 4 | 4 | 5 | 4 | 4 | 5 | 4 | 4 | 0.0006 | 8.4 | Area estimated on an approximate total area of amenity grassland, roads, car parks and major footpaths and footpath verges. |

# *APPENDIX L*

# *COMMUNITY ECONOMIC BENEFITS*

## *Appendix L*

## *Community Economic Benefits*

### Introduction

NHS Greater Glasgow and Clyde recognises within the current economic climate the need to utilise its infrastructure investment in South West Glasgow effectively to support and sustain business and jobs in the wider economy.

The redevelopment of the Southern General site is recognised by partners as a catalyst for broader economic and social regeneration, contributing positively to the physical development of the local area and contributing significantly to the South West economy and that of the wider locality.

This section outlines the approach undertaken by NHS Greater Glasgow and Clyde to engage partners and communities in maximising the economic impact of its investment in the New South Glasgow Hospitals Campus.

### Economic impact

A key consideration in planning for the new hospitals campus is to engage partners in identifying and maximising the potential economic and social benefits from the planned investment in South West Glasgow.

The board secured funding from partner organisations and commissioned an economic and social impact analysis of its planned investment in the Southern General site.

The anticipated benefits and impacts were assessed at three geographically defined levels:

- South West Glasgow
- Glasgow City
- Glasgow City Region.

The analysis estimated that based on final service configurations the NSGH site will make a combined direct, indirect and induced contribution of between £30m and £40m per annum to the South West Glasgow economy; £110m – £140m to the City economy and £240m - £290m to Glasgow City Region once fully implemented. (see Table 1).

**Table 1: NSGH Economic Impacts Summary (£m)**

| | Estimated future direct impact of services locating to NSGH (using scenario 2) (£m) | Estimated combined future impact, with multiplier effects (£m) | Estimated combined future impact of the site based on employment level of 8,400, with multiplier effects (£m) |
|---|---|---|---|
| South West Glasgow | £30 | £30 – 40 | £40-£50 |
| Glasgow City | £90 | £110 - £140 | £140 -£175 |
| Glasgow City Region | £170 | £240 - £290 | £300 - £370 |

Source: SQW Socio-Economic Impact Analysis

Based on final service configurations on the South Glasgow Campus, the economy in South West Glasgow will gain approx 5600 jobs. In addition to the economic impact of the development upon completion, the analysis also estimated the economic impact of the construction programme.

It estimated that the construction programme associated with the development will support between 1300-1700 jobs per year within the construction industry and related sectors throughout the construction phase of the project.

The analysis identified a number of opportunities and made a series of recommendations for partners to progress in maximising the economic impact of the development. These included:

- Collaboration with the housing sector to support NHS staff access affordable housing in South West Glasgow, maximising the economic impact within the local economy
- Maximise training, recruitment and employment opportunities for communities in the construction phase of the project.
- Establish a workforce development plan to equip communities in South West Glasgow with the skills and competencies to pursue a career in Healthcare
- Maximise the impact on the local economy through providing opportunities for business to engage in procurement processes
- Engage in partnership structures to facilitate integrated planning and maximise the impact of the NSGH investment within its wider “place” context
- Maximise biomedical research, knowledge transfer and commercialisation opportunities within the life sciences sector.

The analysis concluded that the Southern General development is seen as a catalyst for regeneration activity, contributing positively to social, economic and physical renewal in South West Glasgow.

However, the analysis was also clear the potential impact of the new South Glasgow Hospitals Campus will only be realised through effective collaboration between partner organisations, building on existing partnership structures in South West Glasgow and Glasgow City.

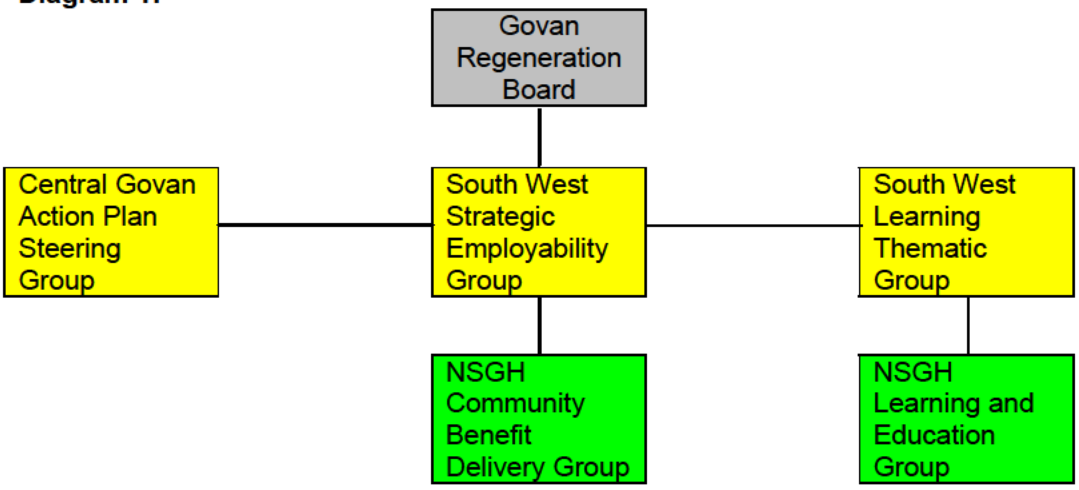
**Partnership Working**

The analysis recognised that to realise the potential social and economic development opportunities required effective joint working and collaboration across partner organisations.

Actions were required to be embedded within established partnership structures in South West Glasgow, avoiding potentially duplicating/overlapping structures. The analysis was clear that NHS Greater Glasgow and Clyde should be fully engaged as partners but, importantly, not positioned to "own" the whole social and economic development agenda that can be advanced by the NSGH investment

There is in place a well established partnership environment in South West Glasgow. In furthering socio-economic objectives, the board has sought to embed planning and delivery of economic impacts through these planning structures. Where appropriate, the board has established additional planning groups to support delivery of socio-economic objectives (Diagram 1).

**Diagram 1:**



In addition to the above structures, the board is engaged in specific projects, programmes and initiatives to further economic and social objectives in South West Glasgow. These include the development of Govan Community Campus in partnership with Education Services and the Fairfield Farm house project in partnership with Linthouse Housing Association.

**Economic Impacts from the Construction Programme**

The Scottish Government has played a leading role in developing new ways to deliver added social benefits through procurement. In February 2008 Scottish Government guidelines on the use of Community Benefit Clauses in public procurement were published.

In taking forward the recommendations from the socio-economic analysis NHS Greater Glasgow and Clyde incorporated Community Benefit considerations in the procurement process for the New South Glasgow Hospitals project.

Through incorporating community benefits in the procurement process, the board is seeking to work in partnership with the successful bidder to ensure as far as possible, that a significant proportion of the investment is retained in the local economy, supporting local businesses, sustaining local employment and creating new training and employment opportunities.

The community benefit provisions within the procurement process focussed on:

- Targeted Recruitment and Training
- SME supplier development
- Social Enterprises development

**Training and Recruitment**

BCL have committed to deliver a target of 10% of total labour required to deliver the project (including those works delivered by specialists, or sub-contractors) to be delivered by New Entrants. In addition, BCL has also committed to deliver additional targets in relation to training and learning (see Table 2).

**Table 2: Training and Recruitment Targets**

| **Indicator** | **Total** |
|---|---|
| Total number of people employed in delivery of contract. | 2505 |
| New Entrants | 250 |
| Qualifications to be achieved by new entrants | 315 |
| No. of Apprentices | 88 |
| Work Experience Places | 184 |
| Lifelong Learning Opportunities | 1060 |

BCL have entered into a partnership with Glasgow South West Regeneration Agency (GSWRA) to deliver training and recruitment targets. In furthering the training and recruitment targets, GSWRA working with BCL will:

- Devise a Local Labour Action Plan and establish requirements with Sub-Contractor/s to recruit and source supplies locally where these exist.
- Establish an operational team to deliver services including: vacancy promotion, skills assessment and matching, general and vocational training and business development.
- Establish a “Recruitment & Training Centre” in close proximity to the New South Glasgow Hospitals Project.

- Share relevant data and management information to ensure collaborative working.
- Identify and source funding from various agencies, development programmes, charities to ensure that aims and objectives are achieved.
- Engage effectively with the community and other stakeholders on the work of the Partnership.
- Recruit relevant partners to enable effective delivery of these aims.

In addition to the above, BCL has adopted a recruitment protocol were all vacancies resulting from the construction project will be notified to GSWRA to support mainstream recruitment form communities in South West Glasgow.

To support this activity, GSWRA have launched a web portal for individuals interested in securing recruitment and training opportunities www.nsgh.jobs.com.

**Developing the Supply Chain**

In assessing and developing the capacity of Small Medium Enterprises (SMEs) BCL has entered into partnership with Glasgow City Councils Supplier Development programme (SDP) to support and develop the capacity of Small Medium Enterprises by undertaking:

- Activities to identify Small Medium Enterprises (SME's) and assess their capacity.
- Actions to assist Small Medium Enterprises (SME's) to obtain contracts
- Actions to ensure that the sub-contractors make work packages available to Small Medium Enterprises (SME's)
- Measurement of the social and economic impact of the engagement with the Small Medium Enterprises (SME's)
- To provide support for the Small Medium Enterprises (SME's) to assist them to work in Partnership.

In assessing and developing the capacity of social enterprises, BCL have entered into partnership with Community Enterprise in Scotland. Community Enterprise in Scotland under the Scottish Governments "Ready for Business" programme will support and develop the capacity of Social Enterprises by undertaking:

- Activities to identify Social Enterprises and assess their capacity.
- Actions to assist Social Enterprises to obtain contracts
- Actions to ensure that the sub-contractors make work packages available to Social Enterprises
- Measurement of the social and economic impact of the engagement with the Social Enterprises
- To provide support for Social Enterprises to assist them to work in Partnership.

BCL are working with Glasgow City Council and Community Enterprise in Scotland to provide training and support to equip SMEs and social enterprises with the relevant expertise and policies to enable them to bid for potential sub-contracting opportunities.

Recognising that the scale of opportunities available may be prohibitive for smaller SMEs and social enterprises, BCL has committed to identify construction and non-

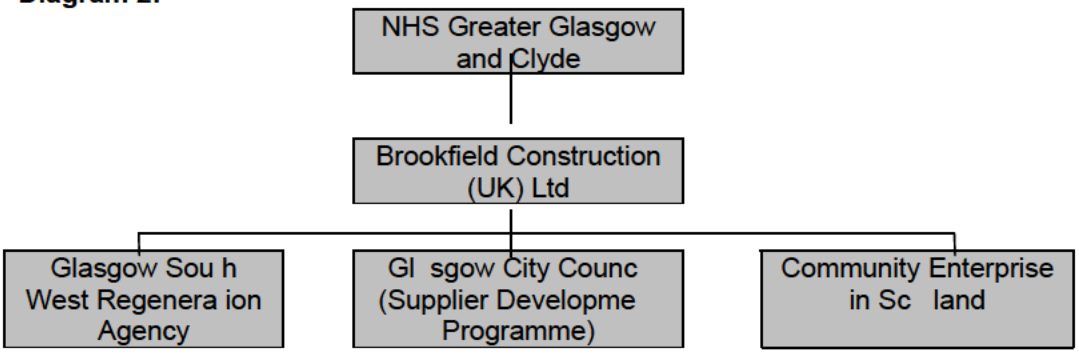
construction related 'work packages', which are accessible to SMEs and social enterprises who otherwise would have found it difficult to secure a contract.

BCL have agreed a protocol for SMEs and SEs wishing to engage in the project. This has been supported by the establishment of a portal, www.nsghproject.com for individuals and businesses to register for procurement opportunities.

**Implementation**

The successful bidder, Brookfield Construction Ltd (BCL) has established a partnership structure, supported by a partnership agreement to support the delivery of its community benefit programme (Diagram 2).

**Diagram 2:**

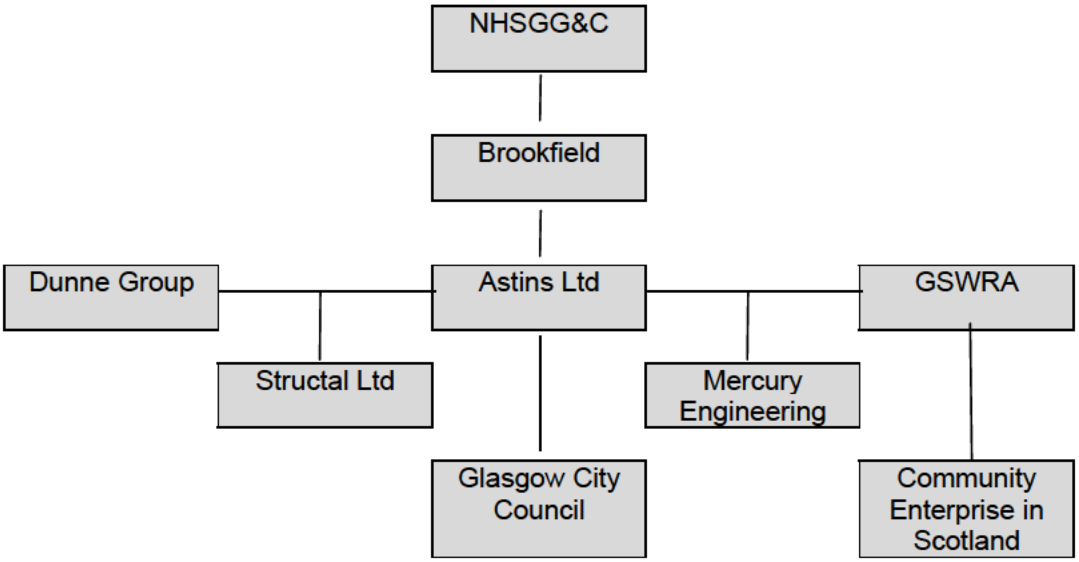


In implementing the community benefit programme BCL will ensure as a condition of contract that all sub-contractors engaged on site are required to deliver targets in relation to training and recruitment, SMEs and Social Enterprises.

BCL are required to provide regular monitoring information to NHS Greater Glasgow and Clyde on a quaterly basis, enabling the board to measure performance against agreed measures. (See Appendix 1 and 2). This is reported to the NHS board through the ASR Systems Redesign Group.

A Community Benefit Delivery Group (see Diagram 3) has been established with partners and sub-contractors. This group is responsible for co-ordinating partners' activities, overseeing the implementation of the community benefit programme and ensuring the project is achieving the targets set out in BCLs bid submission.

**Diagram 3: Community Benefit Delivery Group**



The structures outlined above have been developed as part of the implementation of the laboratory project currently under construction.

This has helped establish the foundations to maximise the economic impact from the construction phase of NHSGG&Cs investment. Subject to the FBC being approved, BCL and partners will accelerate the implementation of the community benefit strategy contained within their bid submission.

**NHS Careers**

As described in the workforce section, NHSGGC recognises that in order to deliver new models of care within the new provided hospitals significant workforce development will be required.

In addition to targeted training and recruitment linked to the construction of the new hospitals, a key objective of the project is to equip communities with the appropriate skills and competences to meet NHSGG&CS future workforce requirements.

In order to maximise the economic impact form NHSGG&Cs investment, it is important that the proportion of staff employed on site and resident in South West Glasgow is maximised (see Table 3).

Recognising the need to develop a long term strategic approach the report recommended that in maximising the impact of NHS Greater Glasgow and Clyde's investment in South West Glasgow, the following actions were required:

- Raising aspirations - a sustained programme of activities with schools to communicate future opportunities for young people presented by the NSGH
- Recruitment planning - the development of an integrated plan to support local recruitment to non-professional posts

- Education pathway - development of an integrated plan to support progression to professional qualifications

- Readiness for work: the development of a readiness for work programme focused on the opportunities offered by the NSGH for those presently far from the labour market

- Skills and training: improved linkages with NHS workforce development function for FE colleges to develop a shared action plan to address needs and opportunities of mutual interest

A Force for Improvement: The Workforce Response to Better Health, Better Care recognises the requirement for NHS Boards to take account of the changing expectations of the workforce and wider labour market to ensure it becomes an employer of choice and develops sustainable workforce solutions.

NHS Greater Glasgow and Clyde has developed clear, structured and well-supported pathways to enable people from marginalised groups to access employment opportunities. Specific initiatives to recruit to hard-to-fill posts and the use of work experience, pupil experience placements, volunteering and socially inclusive employment opportunities are included in the NHS Board recruitment strategies.

In the context of the New South Glasgow Hospitals Campus, NHS Greater Glasgow and Clyde aims to build on existing programmes and initiatives, supporting communities in South West Glasgow access future employment and training opportunities.

In planning to meet the future workforce requirements, NHSGG&C is working in partnership with training and education providers across Greater Glasgow and Clyde and has established an Education Partnership. The Education Partnership comprises NHS Greater Glasgow and Clyde, Anniesland College, Cardonald College, James Watt College, Glasgow Caledonian University and the University of the West of Scotland with a range of national stakeholders.

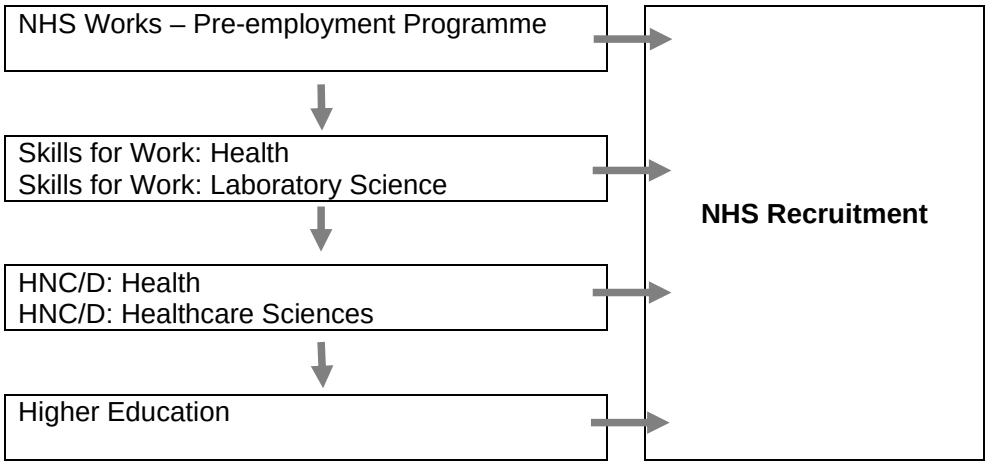
The Partnership has been established to develop and deliver comprehensive education and qualifications for our support services workforce on NHS Career Framework Levels 1 – 4. As discussed in the workforce section, a significant component of the redesigned workforce will include the greater use of trained workers on levels three and four of the NHS career framework.

In taking forward the work of the partnership in South West Glasgow, a partnership group including representation from NHSGG&C, South West Community Health and Care Partnership, Community Planning Glasgow, Glasgow South West Regeneration Agency, Glasgow City Council Education Services and Cardonald College has been established.

Working across existing partnership structures, the groups remit is to co-ordinate and manage joint working with stakeholders, maximising learning, education and training opportunities for communities in South West Glasgow. In doing so, the partnership aims to establish a learning pathway that equips individuals with the skills and competencies to pursue a career in healthcare and contribute to NHS Greater Glasgow and Clyde meeting its future workforce requirements in South West Glasgow.

The partnership aims to raise aspirations within South West Glasgow to pursue a career in healthcare and focuses on supporting individuals achieve the skills and competencies to access the workforce at NHS Carers Framework levels 1-4 (Scottish Curriculum and Qualifications Framework Levels 5-9).

**Diagram 4:**: Proposed Learning Pathway



The board has already undertaken a number of early actions to support the implementation of the learning pathway in South West Glasgow, these include:

- Presentations and briefings to Skills Development Scotland staff working with school age children and adult returners
- Programme of careers sessions undertaken by NHS recruitment in secondary schools in South West Glasgow.
- Engaging secondary schools in South West Glasgow to increase number of pupils indicating a preference for NHS work experience placements
- In partnership with Job Centre Plus, Skills Development Scotland and NHS Recruitment deliver monthly NHS careers sessions in Govan and Shawlands Job Centres.
- In partnership with Cardonald College establish HNC/D Applied Science to be delivered in 2011
- Increase participation on the HNC/D programme through piloting Skills for Work: Applied Science qualification in South West Glasgow.
- In partnership with workforce development establish HNC/D Health to be delivered through Cardonald College in 2011
- Increase participation on the HNC/D programme through piloting Skills for Work: Health qualification in South West Glasgow.

As the final configuration of services on the NSGH is implemented, NHSGG&C will work in partnership with employability services in South West Glasgow and Glasgow City to maximise opportunities for communities and co-ordinate activities with partners to implement a long term strategy.

**Housing Sector**

Through established partnership structures, NHSGG&C continues to work closely with Glasgow City Council, GHA and local housing providers in South West Glasgow. The focus of this engagement has been to inform future housing investment and improve access to affordable housing for NHS staff in South West Glasgow. This includes planning for the East Govan/ Ibrox transformational area and Central Govan.

The Central Govan Action Plan is investing £68 million providing 508 new homes for over 1,800 people. NHS Greater Glasgow and Clyde is a partner the project Steering Group. Through the work of the partnership, new developments delivered through the Central Govan Action Plan now include NHS employees under the priority purchase scheme criteria. The next phase of development undertaken by Govan and Elderpark Housing Associations are currently under construction and will be pro-actively marketed to NHS staff as part of this scheme.

To support this programme, Govan and Elderpark Housing Associations and Crudens Homes in partnership with the NHS Credit Union and Glasgow Credit Union launched Unique Property Solutions. The project aims to provide financial support through the NHS Credit Union to support NHS staff access affordable housing in South West Glasgow.

In doing so, the board aims to retain the economic impacts in South West Glasgow through increasing the proportion of staff employed in the NSGH resident in South West Glasgow. In doing so, the board will also contribute to the projects sustainability by encouraging staff to locate with in walking and cycling distance.

In addition to the above, through the established housing forum, the board has been actively engaging housing providers in South West Glasgow to establish co-ordinated marketing and communications to raise awareness of rental and purchasing options available for existing and re-deployed staff in South West Glasgow.

**Life Sciences**

Life science has become a key sector in Glasgow due to the benefits it derives from being part of a comprehensive national life sciences strategy, backed by industry, academia, the National Health Service and the government.

The Royal Hospital for Sick Children, as the largest children's hospital facility in Scotland, is a key centre of under-graduate and post-graduate teaching and clinical research. The opportunities afforded by co-location will foster increased academic collaboration between paediatric, obstetric and adult specialities across a range of common education research interests.

The Southern General hospital is a key centre of under-graduate and post-graduate teaching and clinical research with key linkages.

NHS Greater Glasgow and Clyde has established innovative partnerships with Universities, these include the Glasgow node of the Scottish Academic Health Sciences Collaboration, Glasgow Bio-medicine and Strathclyde Institute of Medical Devices and the Glasgow Centre for Cancer Research.

In order to meet the life science sector's capacity for innovation and research, Scottish Enterprise Glasgow has proposed the establishment of a science and technology diamond in Glasgow to capture the economic potential of the investment; this includes the development of South Glasgow Medipark to the West of the NSGH project.

A study of land availability and land designation adjacent to the NSGH site undertaken by Scottish Enterprise concluded that in order to proceed with establishing the Medipark proposal, the availability of land and its designation in the existing development framework was prohibitive.

The board has been working with partners to establish a planning framework to unlock the economic potential from NHS Greater Glasgow and Clyde's investment. This is supported in City Plan 2 which recognises the significance of the NSGH Project and proposes bringing forward a development framework for the broader area.

The requirement for a development framework to bring forward higher value developments in the area around the NSGH is critical if the economic impact is to be realised. This is of particular importance in relation to life sciences and bio-medical developments.

Subject to FBC approval, NHS Greater Glasgow and Clyde will engage Scottish Enterprise and the University sectors to establish a site commercialisation strategy based on the future configuration of university services to be delivered on site. This will be supported through existing planning structures to establish a land use strategy conducive to supporting investment in life science related industries.

**Appendix 1:**

**SME/ Social Enterprise Indicators**

| Target Number | Indicator | Target | | |
|---|---|---|---|---|
| | | Direct | Indirect | Total |
| | **SME/SE development** | | | |
| **1** | No of sub contracts advertised | | | |
| | Value of contract advertised | | | |

*Appendix M*

*Governance Arrangements: Workgroups and Remits*

**NEW SOUTH GLASGOW HOSPITALS AND LABS PROJECT**

**GOVERNANCE ARRANGEMENTS**

Performance Review Group

Terms of Reference

- Monitor Boards organisational performance
- Monitor resource allocation and utilisation
- Monitor the implementation of agreed Board strategies
- Oversee all aspects of property matters and transactions

Membership

| | |
|---|---|
| Mr A O Robertson OBE - Chair | Mr R Cleland |
| Ms R Dhir MBE | Cllr D Mackay |
| Mr P Hamilton | Cllr D Yates |
| Mr D Sime | Mrs E Smith – Vice Chair |
| Mr P Daniels OBE | Mr I Lee |
| Mr K Winter | |

Frequency - Bi-monthly

Acute Services Strategy Board

Terms of Reference

- Oversee the delivery of the Acute Service Review
- Oversee the performance of the Acute Services Acceleration Plan
- Report and advise the Performance Review Group on all aspects of the implementation of Acute Services Review
- Monitor all aspects of performance of the implementation of the New South Glasgow Hospital Development.
- Approve change control in that any change which impacts upon the project must be authorised by this Board before it can be implemented.
- Ensure that progress is maintained and business is concluded especially where time is critical to the New South Glasgow Hospital Development with respect to financial aspects and the implementation of works programme and exercise appropriate delegated authority to enable the progress on the contract
- Ensure that all activities of the Acute Services Review Systems Redesign Group are co-ordinated and achieving the appropriate progress.
- Review updates regarding all aspects of planning and implementation of Acute Services Review
- Consider the wider implications of implementing the Acute Services Review including any impact on local communities
- Ensure necessary linkages between elements of Acute Services Strategy are in place to enable delivery of Acute Service Review
- Ensure financial control is being managed and kept within the agreed parameters.
- Approve and monitor the appropriate governance is in place to ensure successful outcome for each major element of the Acute Services Review.
- Approve Full Business Case for New South Glasgow Development and any subsequent Business Cases for associated projects such as; car parks; education centre and academic centre etc
- Liaise with Communications and Marketing Group to ensure they are sighted on the relevant issues in order that they can proactively support the planning and implementation of all activities
- Overseeing the Risk Management process by reviewing the risk register on a regular basis
- Carry out the management, control and approval of Compensation Events up to a maximum of £1.5M

Membership

| | |
|---|---|
| Robert Calderwood (chair) | Jane Grant |
| Rosslyn Crocket | Jim Rundell - Audit Scotland – Observer |
| Alan McCubbin | Representative from Scottish Government Performance Dept – Observer |
| Mike Baxter Scottish Government – Observer | Brian Cowan |
| Douglas Griffin – In attendance | Alan Seabourne – In attendance |

Frequency - Bi-monthly

Acute Services Strategy Board Executive Sub Group

Terms of Reference

- Exercise delegated authority to make decisions on project issues to maintain programme
- Exercise delegated authority to commit funding for new or additional works associated with project (includes management and control of compensation events)
- Receive reports from Acute Directors and Project Director on changes being proposed with financial implications
- Keep Acute Services Strategy Board informed of all issues and decisions taken regarding the project
- This group has delegated authority in line with Boards SFI's which has an agreed delegated limit for the Acute Service Review Executive Board and the Project Manager.
- The Scheme of Delegation appropriate to this project is advised as follows

    - Project Manager approve expenditure up to £10,000
    - Project Director approve expenditure up to £100,000
    - Acute Services Strategy Board and Executive Sub-Group approve expenditure up to £1.5M
    - Performance Review Group approves expenditure over £1.5M

Membership

| | |
|---|---|
| Robert Calderwood | Jane Grant |
| Alan McCubbin | Peter Gallagher |
| Alan Seabourne | Brian Cowan (as required) |
| Rosslyn Crocket (as required) | |
| In attendance : relevant Director | |

Frequency - Weekly

Acute Services Review Redesign Group

Terms of Reference:-

- Participate in the development and implementation of the overall Acute Services Strategy for the NHS Board
- Agree governance and performance management arrangements for the Division covering the range of the Division's responsibilities in relation to the delivery of the Acute Services Strategy and the Accelerated Capital Programmes and monitor performance against these arrangements
- Monitor the delivery of the programmes agreed within the Acute Services Strategy
- Discuss significant programme deviations by exception and propose remedial actions required to bring delivery programmes on time and within budget
- Develop a structured re-design programme to maximise patient and service benefits in the new hospital through ensuring that the physical design of the new hospitals deliveries the clinical performance requirements in line with National and Board policies and requirements
- Maximise PFPI input along with other key stakeholders in new hospital design
- Ensure health inequalities issues are addressed in a structured and focused manner
- Ensure issues such as art in design and transport have a distinct focus and plan within new hospital project
- Co-ordinate regeneration aspects of project to ensure greatest impact
- Consider and manage key areas of clinical and non-clinical risk, drawing any significant issues to the attention of relevant Board officers
- Liaise with Communications and Marketing Group to ensure they are sighted on the relevant issues in order that they can proactively support the planning and implementation of all activities

Membership:-

| | |
|---|---|
| Jane Grant (Chair) | 1 Representative from each Clinical Directorate (6) |
| Anne MacPherson | Alan McCubbin |
| Sharon Adamson | Brian Cowan |
| Alex McIntyre | Richard Copland |
| Rory Farrelly | Iona Colvin |
| Donald Sime | Anna Baxendale |
| Ann Crumley | Niall McGrogan |
| Karen Murray | Alan Seabourne + Team |
| Peter Gallacher | |

Frequency:- Monthly

Joint Project Steering Group

Terms of Reference

- On a monthly basis identify key Strategic Drivers for the coming quarter
- Carry out a monthly review of Project Strategic Drivers providing direction to the Project Management Group (PMG) as required
- Carry out a monthly review of project issues (reported from sub groups via the PMG) that have not been cleared at sub group level
- Provide direction to the sub groups on the resolution of issues
- Monitor and identify any shortfalls in Project resources
- Monitor critical path of Project Programme
- Ensure that Brookfield's communication support work effectively with the Communications and Marketing Group

Membership represents the Board and Brookfield

Sub Groups

Project Management Group
Commercial Group
Construction Interface Group
Technical Design Group
Design & Health Environment Strategy Group
Joint Commissioning Group
Medical Planning Group
IT Group
Equipment Group
Communications and Marketing Group

Laboratory Medicine Project Group

Terms of Reference

- Act as an Overarching Governance Group to ensure delivery of ASR Programme
- Ensure a coherent and coordinated approach to the delivery of the Laboratory Project
- Manage communications to all stakeholders
- Ensure project programmes are delivered on time
- Oversee sign-off Reviewable Design Data
- Ensure IT and equipment requirements are addressed and embedded in design detail
- Provide decision on all potential changes and to ensure any decisions fall within the current cost programme plan
- Facilitate progress when situations are complex and/or difficult
- Review and advise on project risks
- Responsible for all staff issues and the commissioning programme
- Receive reports and take necessary action from Laboratory Sub Group

Frequency - Monthly

Project Team

Terms of Reference

- Responsible for the overall delivery of the project including programme, costs, quality, health and safety etc
- Responsible for managing all compensation events by actively applying mitigating strategies to contain costs

Frequency - Weekly

NCH Project Group

Terms of Reference

- To oversee the work of the Clinical Planning Group
- To recommend, sign off proposals in regard to development of NCH
- To ensure work programmes are completed on schedule by the NCH User Groups
- To inform and update the Acute Services Review Redesign Group
- To ensure involvement of staff and other stakeholders
- To make recommendations on any financial consequences regarding the cost of the NCH

Frequency - Monthly

Adult/Children's Users Groups

Terms of Reference

- Review architectural design progress for 1:200 and 1:50 drawing detail
- Provide professional input into design process
- Communicate with other colleagues and stakeholders
- Liaise with Acute Directors on progress and any issues requiring their attention
- Do not add costs to project budget
- Sign off design details

Frequency - every 6 weeks

Site Co-ordinating Group

Terms of Reference

- Ensure there is an overall site development plan which identified all aspects of change planned for SGH site
- Monitor the critical path to ensure key milestones are planned and met
- Ensure adequate level of health and safety planning is maintained
- Receive reports from individual projects on the SGH site to ensure they are planned and implemented in a co-ordinated way to take account of all interfaces and risks

Frequency - Bi-monthly

Project Supervisor (Stages 1 & 3)

Terms of Reference

- Compliance with agreed specifications
- Testing of installed product strength and tolerance
- Quality of finish checks
- Area compliance checks
- Exemplar rooms checks
- Monthly reporting
- Inspections identify, record and sign off as complete – defects
- Health and safety assurance
- QA/Document control management

Frequency - Weekly

Communications and Marketing Group

Terms of Reference

To plan strategically for the handing of proactive communications milestones, staff communications, marketing (social and advertising), media and joint working with the PR/Marketing Departments of Brookfield and others as appropriate

Frequency - Quarterly

# Executive Summary

Background:

| | |
|---|---|
| Project | New South Glasgow Hospitals including Adult Acute (1109 beds), Children's (256 beds), Laboratories and Mortuary |
| Report | Project Execution Plan (PEP)<br><br>Stage 1 Laboratories Construction<br><br>Stage 2 Adult & Children's Hospital Design Development |

This plan describes the procedures and systems, which should be used by the Project Team to manage and control the development of the Design Development and Construction phases for the development at the Southern General Hospital site.

The intention of this document is to create an easily understood management framework, which recognises the project requirements and constraints and facilitates the delivery of a successful product.

Every effort has been made to ensure that the contents of this plan are in line with the various legal agreements that are in place. However, in the event of a conflict between this manual and the formal agreements, the provisions of the formal agreements will always prevail.

It is the intention that a draft version of this document will be circulated to the project team for comment with the objective being to ensure the information contained within the document is accurate and that no conflict occurs between the PEP and the project particulars, Employer's processes & procedures and quality standards required by all parties including the Employer.

The Project Execution Plan (PEP) will be managed by the Project Manager. The PEP will be further developed during the project with any relevant changes resulting in a revised PEP being issued to the project team. This will be recorded by the way of a sequential number change.

# Table of Contents

Appendices

Appendix A - Project Directory
Appendix B - Schedule of Meetings
Appendix C - Strategic Programme

# 1 Introduction

## 1.1 Principal Parties

The development works are commissioned by NHS Greater Glasgow & Clyde, who is the Client/Employer and they have appointed Currie & Brown to provide Technical Advisor Services for the Development to deliver the new facilities covering:

- Project Management
- Cost Management
- Architectural Design Review
- Mechanical & Electrical Engineering Design Review
- Civil & Structural Design Review
- CDM Coordination

In supporting the development, Currie & Brown will interact with both The Board and other professional advisors including:

- Shepherd & Wedderburn – Legal
- Ernst & Young – Financial
- SFT – Procurement
- JMP Consultants – Transport
- Capita Symonds – NEC3 Project Supervisor

The Currie & Brown led Technical Advisory Team is as follows:

| | |
|---|---|
| Project Manager | Currie & Brown UK Limited |
| Cost Manager | Currie & Brown UK Limited |
| Medical Planner | Buchan Associates |
| Master Plan Architect | HLMAD Limited |
| Adult Acute Hospital Architect | HLMAD Limited |
| Children's Hospital Architect | Boswell Mitchell & Johnston |
| Civil & Structural Engineer | URS Corporation |
| Hospitals M&E Engineer | Wallace Whittle Limited |
| CDM Coordinator | URS Corporation |
| Fire Engineer | Buro Happold Consulting Engineers |

## 1.2 Principal Documents

The current documents previously issued are as follows:

- The Works Information Part 1 – Employer's Requiremernts
- The Works Information Part 2 – Contractors Proposals
- Outline Business Case - Hospitals
- Full Business Case - Laboratories
- Outline Planning Consent
- Environmental Impact Analysis
- Traffic Impact Analysis

These documents are in circulation and copies can be issued on request.

Work in the next stages of the programme will generate or update the following in accordance with Appendix K of the Employer's Requirements:

Hospitals (Design Development)

- 1:500 Adjacency Layouts
- 1:200 Departmental Layouts
- 1:50 Room Layouts
- Schedules of Areas
- Room Data Sheets
- Equipment Lists
- Masterplan to achieve Planning Consent
- Building form & materiality to achieve approval of Matters Specified in Conditions
- M&E Design

Laboratories (Construction)

- 1:200 Departmental Layouts
- 1:50 Departmental Layouts
- Room Data Sheets
- Equipment Lists
- IT Solutions
- Breeam Performance Rating
- FM Provision

## 1.3 Roles of Parties

The role of each of the development team and contractor are set out in Organisation charts showing the contractual and communication links included in Section 3. The roles are defined within the NEC3 contract and are clearly split between Client and Contractor as indicated.

## 1.4 Project Ethos

The Client intends that the project team maintain a balanced view of the project objectives. Crucially, value considerations are of paramount importance and the correct balance between environmental issues, design, quality, programme and cost in use must be found. The process will involve full consideration of the project objectives in conjunction with a process of risk and value appraisal.

The NEC3 Contract has embedded within it the ethos of working in partnership and this has to be extended across the entire project delivery team, both client and contractor to maximise the inherent benefits and realise optimum value.

## 1.5 Project Directory

The project directory is included in Appendix A

# 2 Development Details

This section provides a brief introduction and overview of the development.

## 2.1 Development Name

NHS Greater Glasgow & Clyde: New South Glasgow Hospitals & Laboratories

## 2.2 Development Objectives

The principle objectives are as follows:

- To develop the site in accordance with the requirements of the Client's Development Brief.
- Delivery of the product within the contract sum.
- Delivery of the project, as scoped, not later than 07 January 2015.

## 2.3 Project Description

The delivery of a staged programme of facilities including:

- Mortuary, including The City Morgue.
- Laboratory facilities for Haematology, Biochemistry, Pathology and Medical Genetics.
- New 256 Bed Children's Hospital linked to Maternity and Adult Hospitals.
- New Adult Acute Hospital linked to Children's Hospital and Neurosurgery Institute.

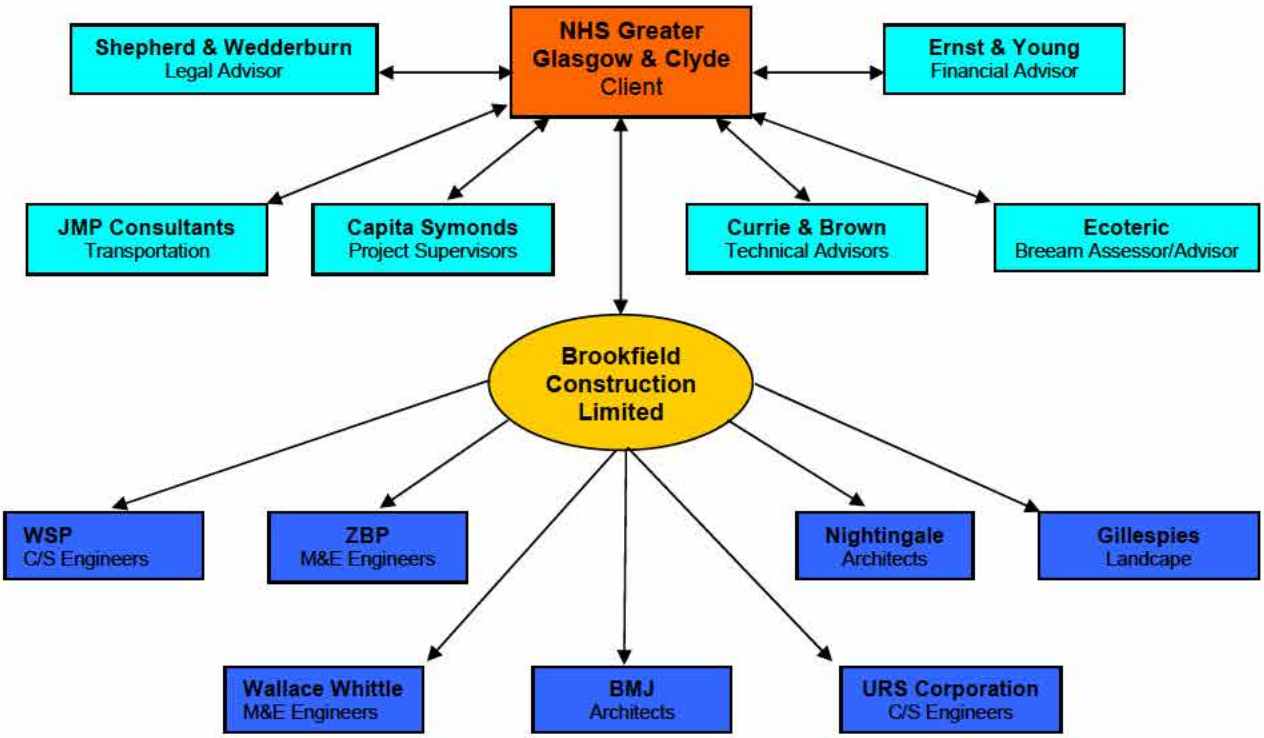
# 3 COMMUNICATIONS

## 3.1 General Provisions

Effective communication between all parties is vital to the success of the Development and to achievement of the time, cost and quality objectives. It is the responsibility of each and every member of the project team to ensure that their information is clearly co-ordinated and communicated to all **relevant** members of the team.

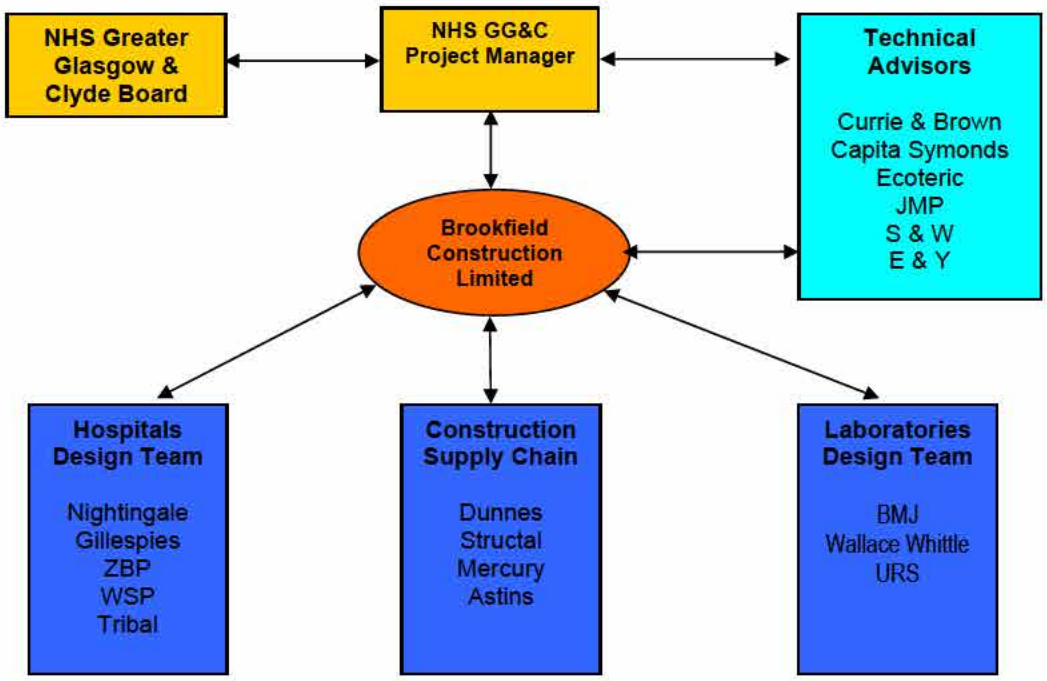
## 3.2 Contractual Links

In order to guide parties the contractual links for design have been illustrated below.



## 3.3 Communication Links

In order to guide parties on the appropriate communication and information distribution links the following table has been prepared.



In general the Project Manager is to be included in **ALL** communications.

If there is any doubt as to the importance, urgency, or to whom information is relevant, the matter should be referred to the Project Manager.

## 3.4 Verbal Communication

The most important means of communications will be verbal, either face to face, via the telephone or via e-mail.

It will always be considered as the primary means of conveying information. Unnecessary written correspondence is discouraged.

Significant verbal communications are always to be confirmed by e-mail.

## 3.5 E-mail

All e-mails will be headed "NSGH:", followed by the subject title. Every Effort must be made to use discrete, short and descriptive headings.

If an e-mail response is required that day then the subject title must be followed by the word "URGENT" and followed up with a phone call. it is worth while noting that "URGENT" emails must be that and this should not be used on general emails.

Efficiency will be improved if communications are appropriately targeted. Due to the size of the project team, blanket communications MUST be avoided.

All drawings must be sent in dwg and PDF format. Hard copies will be issued by request only.

## 3.6 Facsimiles

Facsimiles should only be used where e-mails are not suitable and they must be kept to a minimum length.

All facsimiles will be headed "NSGH:", followed by the subject title. Every Effort must be made to use discrete, short and descriptive headings.

## 3.7 Written Correspondence

Matters of a contractual or commercial nature shall always be confirmed in writing.

Such letters and notices should also be sent in duplicate by e-mail to allow parties to commence preparation of an associated response at the earliest.

# 4 Meetings

## 4.1 General Provisions

Meetings can consume a large amount of the team's time and their size, length and the number of attendees should be kept to an effective minimum. The Chairman in each case will be responsible for:

- Preparation and circulation of an Agenda at least 24 hours prior to the meeting.
- Decisive chairing of the meeting to ensure all parties are heard and those meetings do not lose focus.
- Ensuring that effective decisions are made and that responsibility for additional actions and target dates are agreed and understood.
- The preparation and distribution of the minutes to be issued generally within 3 working days, with copies to all present plus any other defined parties. The chairperson of each meeting is responsible for ensuring that all members of the team receive copies of the minutes.

Meetings will generally be conducted as set out below.

## 4.2 Project Steering Group

These meetings have commenced, following appointment of Brookfield Construction Limited and are intended to provide a high level overview of the project and to provide a final point of escalation prior to referral to the Acute Services Strategy Board.

| | |
|---|---|
| Purpose: | To monitor progress and to resolve blockages |
| Location: | Project Site Offices, 1st Floor Boardroom |
| Frequency: | Monthly |
| Attendees: | Alan Seabourne<br>Peter Moir<br>Alan McCubbin<br>Shiona Frew<br>Douglas Ross<br>David Hall<br><br>Ross Ballingall<br>Tim Bicknell<br>Chris Lovejoy<br>Steve Pardy<br>Ed McIntyre<br>Neil Murphy |
| Chair: | Alan Seabourne |
| Agenda/Minutes: | Alan Seabourne |
| Indicative Agenda: | • Introductions/Apologies<br>• Action Notes from Previous Meeting<br>• Matters Arising<br>• Monthly Progress Report/Critical Path Review<br>• Risk Review<br>• Monthly Look ahead/Strategic Drivers<br>• AOB<br>• Next Meeting |

## 4.3 Project Management Group Meeting

These meetings have commenced, following appointment of Brookfield Construction Limited and are the principal point of review and escalation for significant issues which cannot be resolved in the regular management groups. This Group will receive the monthly progress report and will be responsible for approving the Executive Summary for submission to the Project Steering Group and the Acute Services Review Board.

| | |
|---|---|
| Purpose: | To review Progress & Manage Change on:<br>Stage 1: Laboratories Construction<br>Stage 2: Adult & Children's Hospitals Design Development<br>Report key issues to Project Steering Group |
| Location: | Project Site Offices, 1st Floor Boardroom |
| Frequency: | Fortnightly: Every second Tuesday at 12:30pm |
| Attendees: | Alan Seabourne<br>Peter Moir<br>David Hall<br>Douglas Ross<br>Mark Baird<br>Mark McAllister<br>Ross Ballingall<br>Paul Serkis<br>David Bower<br>Darren Smith<br>Ed McIntyre<br>Tom Allan |
| Chair: | Alan Seabourne |
| Agenda/Minutes: | Chair to issue agenda and meeting minutes to the attendees. Minutes to be issued 3 days after meeting. |
| Indicative Agenda | • Apologies<br>• Action Note from Previous Meeting<br>• Matters Arising<br>• Progress Report<br>  o Laboratories Construction<br>  o A&C Design Development<br>  o Statutory Approvals<br>  o Equipment & IT<br>  o Commercial<br>  o Enabling & Infrastructure<br>• Laboratories Construction – Progress Update<br>• Information Required<br>• AOB<br>• Next Meeting |

Formatted: Bullets and Numbering

## 4.4 Commercial Group

These meetings have commenced, following appointment of Brookfield Construction Limited and are the principal point of review and escalation for commercial issues. This Group will receive the monthly commercial report and will be responsible for approving the report submission to the Project Steering Group and the Acute Services Review Board.

| | |
|---|---|
| Purpose: | To manage commercial issues relating to:<br>- Scope Change<br>- Valuations and Payment Process<br>- Risk<br>- Early Warnings & Compensation Events |
| Location: | Project Site Offices, 2nd[t] Floor Boardroom |
| Frequency: | Fortnightly |
| Attendees: | Alan McCubbin<br>Alan Seabourne<br>Douglas Ross<br>Peter Moir<br><br>Paul Serkis<br>Eric Napier<br>Tom Allan |
| Chair: | Douglas Ross |
| Agenda/Minutes: | Chair to issue agenda and meeting minutes to the attendees. Minutes to be issued 3 days after meeting. |
| Indicative Agenda | ▪ Introductions/Apologies<br>▪ Previous Meeting Action Notes<br>▪<br>▪ Any Other Business<br>▪ Date of Next Meeting |

## 4.5 Technical Design & Medical Planning

These meetings have commenced, following appointment of Brookfield Construction Limited and are the forum for review of all technical and medical planning issues arising from user group meetings and design development.

| | |
|---|---|
| Purpose: | Monitor the Progress of:<br>- Statutory Approvals<br>- Design progress & compliance with ER's<br>- Design sign-off<br>- Design Strategy Development<br>Manage clarifications process and alternative design solutions |
| Location: | Project Site Offices, 1st Floor Boardroom |
| Frequency: | Fortnightly |
| Attendees: | Alan Seabourne, Peter Moir, Frances Wrath, Heather Griffin, Mairi Macleod, Hugh McDerment, Jackie Stewart, Karen Connelly, David Hall, Mark Baird, Darren Smith, Manny Ajuwon, Chris Lovejoy, Ed McIntyre, Emma White, Alastair Leighton, Tony Duddy, Paul Britton, David Bower |
| Chair: | Darren Smith |
| Agenda/Minutes: | Chair to issue agenda and meeting minutes to the attendees. Minutes to be issued 3 days after meeting. |
| Agenda | ▪ Introductions/Apologies<br>▪ Minutes of Previous Meeting<br>▪ Technical Issues<br>▪ Information Required<br>▪ Any Other Business<br>▪ Date of Next Meeting |

**Formatted:** Bullets and Numbering

## 4.6 Construction Interface Group

These meetings have commenced, following appointment of Brookfield Construction Limited and are the principal point of review and escalation for site management issues relating to the existing hospital operation and neighbours.

| | |
|---|---|
| Purpose: | Identify short term works on site which may impact upon the existing hospital<br>Identify short term hospital activities that may impact upon the site<br>Manage communication of construction activities to relevant 3rd parties<br>Monitor impacts of work on site |
| Location: | Project Site Offices, 1st Floor Boardroom |
| Frequency: | Fortnightly |
| Attendees: | Hugh McDerment<br>Sam Suddese<br>Shiona Frew<br>Estates Dept<br>Facilities Dept<br>Health & Safety<br><br>Alan Keeley<br>Dave Jordan<br>Kevin Graham<br>Dave Bower<br>Norman Sutherland |
| Chair: | Alan Keeley |
| Agenda/Minutes: | Chair to issue agenda and meeting minutes to the attendees. Minutes to be issued 3 days after meeting. |
| Agenda | ▪ Introductions/Apologies<br>▪ Minutes of Previous Meeting<br>▪ Technical Issues<br>▪ Information Required<br>▪ Any Other Business<br>▪ Date of Next Meeting |

## 4.7 Design & Health Environment Strategy Group

| | |
|---|---|
| Purpose: | - Review the opportunities to incorporate art into the design<br>- Develop Art Strategy<br>- Advise the design process on spatial and technical requirements<br>- Report to Techbical Design Group |
| Location: | Project Site Offices, 2nd Floor Boardroom |
| Frequency: | As Required |
| Attendees: | Alex McIntyre<br>Anna Baxendale<br>Dan Harley<br>David Hall<br>Dorothy Cafferty<br>Frances Wrath<br>Heather Griffin<br>Jackie sands<br>Kate Munro<br>Louise Watson<br>Mairi Macleod<br>Peter Moir<br>Darren Smith<br>Neil Murphy<br>Liz Petrovitch<br>Tom Littlewood |
| Chair: | Anna Baxendale |
| Agenda/Minutes: | Chair to issue agenda and meeting minutes to the attendees. Minutes to be issued 3 days after meeting. |
| Agenda | ▪ Introductions/Apologies<br>▪ Minutes of Previous Meeting<br>▪ Laboratories<br>▪ Adult & Children's Hospital<br>▪ Any Other Business<br>▪ Date of Next Meeting |

## 4.8 IT Group

| | |
|---|---|
| Purpose: | Manage:<br>- the production of Project IT strategy<br>- Coordination of IT spatial requirements<br>- Coordination of technical requirements into the design |
| Location: | Project Site Offices, 2nd Floor Boardroom |
| Frequency: | Monthly |
| Attendees: | Alan Seabourne<br>Alasdair Finlayson<br>Marion Stewart<br>Frances Wrath<br>Hugh McDerment<br>Mark Greig<br>Kenny Birney<br>Lorraine Peebles<br>Fiona McCluskey<br>Karen Connelly<br><br>Chris Lovejoy<br>Tony Duddy<br>Ed McIntyre<br>Steve Pardy<br>Michael Frain |
| Chair: | Alan Seabourne |
| Agenda/Minutes: | Chair to issue agenda and meeting minutes to the attendees. Minutes to be issued 3 days after meeting. |
| Agenda | ▪ Introductions/Apologies<br>▪ Minutes of Previous Meeting<br>▪ Laboratories<br>▪ Adult & Children's Hospital<br>▪ Any Other Business<br>▪ Date of Next Meeting |

## 4.9 Equipment Group

| | |
|---|---|
| Purpose: | Manage:<br>- the production of Project Etquipment strategy<br>- Coordination of Equipment spatial requirements<br>- Coordination of technical requirements into the design<br>- Equipment Selection<br>- Change Control related to Equipment |
| Location: | Project Site Offices, 2nd Floor Boardroom |
| Frequency: | Monthly |
| Attendees: | Robert Stewart<br>Peter Moir<br>Frances Wrath<br>Hugh McDerment<br>Isobel Ferguson<br>Lorraine Peebles<br>Fiona McCluskey<br>Karen Connelly<br>Paul Fairie<br><br>Darren Smith<br>Manny Ajuwon<br>Chris Lovejoy<br>Steve Pardy<br>Michael Frain<br>Dave Bower |
| Chair: | Robert Stewart |
| Agenda/Minutes: | Chair to issue agenda and meeting minutes to the attendees. Minutes to be issued 3 days after meeting. |
| Agenda | ▪ Introductions/Apologies<br>▪ Minutes of Previous Meeting<br>▪ Laboratories<br>▪ Adult & Children's Hospital<br>▪ Any Other Business<br>▪ Date of Next Meeting |

## 4.10 Joint Commissioning Group

These meetings have still to commence. The initial group, to be formed by November 2010 will address the commissioning of the Laboratories and this will be followed in 2011 by the group to manage the Hospital commissioning.

| | |
|---|---|
| Purpose: | - Review of design relative to commissioning activities<br>- Ensure equipment installation is integrated with construction programme<br>- Monitor production and implementation of a commissioning plan<br>- Manage specialist validations |
| Location: | Project Site Offices, 2nd Floor Boardroom |
| Frequency: | Monthly |
| Attendees: | Fiona McCluskey<br>Frances Wrath<br>Heather Griffin<br>Mairi Macleod<br>Karen Connelly<br>Peter Moir<br>Capita Symonds<br>Paul Fairie<br><br>Ross Ballingall<br>Chris Lovejoy<br>Ed McIntyre<br>Dave Bower<br>Ron King |
| Chair: | Fiona McCluskey |
| Agenda/Minutes: | Chair to issue agenda and meeting minutes to the attendees. Minutes to be issued 3 days after meeting. |
| Agenda | ▪ Introductions/Apologies<br>▪ Minutes of Previous Meeting<br>▪ Laboratories<br>▪ Adult & Children's Hospital<br>▪ Any Other Business<br>▪ Date of Next Meeting |

## 4.11 Schedule of Meetings

Refer to Appendix B

# 5 Third Party Approvals

## 5.1 Planning Permission

Responsibility for the obtaining of consents, other than the Laboratories is the responsibility of Brookfield Construction Ltd, although time related delays as a result of the Planning Process are a client risk unless caused by delay in submission of application or subsequent information by BCL.

Master Plan – to be sought as an application for matters specified in conditions (MSC) as specified in the outline consent granted in July 2009. This application was submitted in April 2010 and approval was granted, subject to conditions, in June 2010. BCL remain responsible for addressing the conditions contained within the approval.

Laboratories – Consent already granted, with conditions. All pre-start conditions have been purified and work to continue up to occupation to purify the remaining conditions. BCL are responsible for addressing the outstanding conditions following novation of the design team.

Adult & Children's – These will be dealt with as MSC applications as specified in the Outline Consent granted in July 2009. The applications will be grouped to purify the pre-start conditions in the first instance, followed by further applications throughout the lifetime of the project.

## 5.2 Building Regulations/Fire Certification

The Laboratories Stage 1, sub-structure, application was submitted by NHS GG&C in advance of contractor appointment. Subsequent stage applications (2,3 and 4) are the responsibility of BCL.

The Contractor will be responsible for all Building Control matters relative to the Adult Acute and Children's Hospitals.

The Contractor is responsible for complying with the Building Regulations and liaising with Building Control Inspectors with regard to appropriate site inspections. The contractor must notify the project team when inspections from Building Control are programmed and inform the team at the site progress meetings comments from BC during these visits.

# 6 Progress Reporting (Construction Phase)

## 6.1 Contractor

Programmes

The Contractor must establish Programmes, including the following requirements, at the earliest possible date:

- Pre-construction procurement (long lead items)
- Construction (Master)
- Design (Request for Information)
- Submissions Approval Schedule (SAS)
- Completion Inspections, Testing, Commissioning

The Programmes must indicate all long lead items of plant and materials. In addition, indicative information required dates are to be provided. Throughout the Design Development and Construction period the Main Contractor should keep these programmes updated, and finalise the information required dates.

The programme must show earliest and latest start and finish dates for each activity, and identify all critical activities and milestone payment stages (if any).

### Construction Programme

The Main Contractor will produce the Construction programme.

This programme is to be developed as works progress and monitored on a fortnightly basis with Submission of the Progress Report on the third Friday of each month.

(The Contractors programme identifies the inter-relationship of procurement for detail design, critical works and equipment).

The programme will be actively managed and reported against by the contractor as part of the NEC3 Contract process.

The programme will incorporate key stages where the consultants are required to inspect the works. The key stages are provided in section 9 of this document.

The Contractor should submit at each progress meeting, to the Project Manager a short-term detailed 6-week programme, together with an analysis of performance against the previous 6-week programme.

## 6.2 Contractor's Progress Reports

Upon commencement of the construction Phase, the Contractor will be required to provide monthly written reports for submission to the Project Manager (4 copies) issued at least 48 hours prior to the Progress Meeting. The content of these reports should be inclusive of the following information:

- The activities begun and completed since the previous report and upon what dates.
- The expected remaining duration of all activities begun but not completed.
- Additional activities with expected durations, methods, resource requirements and sequence assumptions.
- Method statements for four weeks work from two weeks hence.
- Any changes to expected duration, methods, resource requirements and sequencing assumptions of future activities.
- Forecast completion date for all works and slippage or advance upon the contract completion date and intermediate milestone dates.
- Programme comparison between actual and programmed in a percentage format for design, procurement and construction.
- Health and Safety information and matters arising.
- Outstanding Information Schedule.
- Resource levels (man hour labour returns)
- Weather records.
- Costed Variation schedule
- Colour copies of a selection of five to seven weekly progress photos.
- Schedule of Contract instructions.
- Submission Approval Schedule (SAS) Status Report.
- Programmes as set out above.

The Contractor will be requested to submit a copy of the proposed format of the above report for approval by the Project Manager three days prior to the Pre-Construction Meeting.

## 6.3 Project Manager Status Report

The Contractor will issue a Project Status Report to the Project Manager shortly after the Progress Meeting, which will summarise the key matters arising. This report will form the basis of the Project Steering Group review meetings undertaken monthly. The following headings will be reported:

- Programme/Progress
- Health & Safety
- Statutory Consents
- Information required from NHS GG&C
- Other Risks/Other Major Issues

## 6.4 Architect Reports

The Architect will prepare a brief report on the issues discussed at the Technical meetings and issue to the design team and to the Project Manager. This report should include a summary of the status of the design, key factors influencing design and risk issues.

## 6.5 Design Consultants Reports

Each consultant will prepare and circulate a brief report at least one day prior to the Technical meetings and project design team meetings outlining actions against the minutes of the previous meeting and detailing issues relevant to their particular areas of concern. The consultant reports should include the following information.

Pre-construction – Technical and Project design meetings

- Design development status
- Status of tender documents
- Information produced during the month

Construction Site meetings

- Change orders design progress
- Information requirements/request status
- Status of contractor, sub-contractor, drawings/subsistence
- Quality Control

## 6.6 Cost Consultants reports

Monthly reports

The Contractor will be required to submit monthly reports to the Project Manager. This monthly report will be discussed with the Client PM at the Commercial Group meetings and, where necessary, at the Project Steering Group Meetings .

## 6.7 Risk Management and Associated Reporting

In accordance with the Contract the Contractor will be responsible for undertaking a risk assessment process with the Contractor/EA during all phases of the project to establish that risks are properly identified and managed. This should be conducted at the Site Meetings.

The Contractor will prepare a pre-construction Risk Register however the Contractor is to submit his risk register at commencement. The analysis is to be prepared in accordance with good practice.
The register must be updated as part of each progress report submission.

# 7 Project Economics

## 7.1 Contract Sum

The contract has “target price” and “maximum price” sums and these can only be varied by a compensation event agreed following Early Warning, Risk Reduction Review and agreement of value all as set out in the change control process.

# 8 Design Development and Change Control Management

## 8.1 Information Issue, Control and Co-ordination

The Contractor is primarily responsible for ensuring the integrity of the design data being produced and for controlling its distribution by means of a continually updated Design Register (drawing list, specification list etc). This list must be issued prior to Technical, Project Design & Site meetings if changes have been made from previous issues.

All drawings are to be in an agreed CAD format, with a suitable layering configuration agreed between the Contractor and Professional Team. All drawings issued to the client Project Manager should be in PDF format.

## 8.2 Revisions to Drawings

All revisions to be highlighted on the drawings with "clouds" and must be clearly explained in the revision column.

## 8.3 Design Data Distribution

Exchange of information electronically via Aconex will be strongly encouraged, particularly in respect of draft data. E-mail addresses for the individual team members are contained on the project directory contained in Appendix A. Drawings must, however, be distributed via Aconex as a PDF file and hard copy if requested.

Formal design review submissions must be made in electronic version with supplemental hard copy information if requested.

## 8.4 Design Consultations

The Submissions Approval Schedule (SAS) sets out areas where consultations with the end users are available and suggested in advance of design development. The Contractor is encouraged to take advantage of these opportunities to help ensure their design proposals accord with the Employer's Requirements and end user requirements.

## 8.5 Design Review

### 8.5.1 Information request schedule

The Contractor must review all design information and prepare a list of information required to satisfy its self that all relevant information to commence and complete the works. The list of information required, will be named 'Request For Information Schedule' (RFIS) for the purpose of this project.

The Contractor is responsible for managing the (RFIS) and ensuring that all information is correct and issued to the consultants within the stated timescale. The design team are responsible for ensuring that all information is issued to the contractor within the correct agreed timescales.

### 8.5.2 Reviewable Design Data: The contractor shall issue and maintain an RDD schedule.

## 8.6 Request for Information Schedule

The Contractor must provide a Request for Information Schedule (RFIS) in sufficient time for the Employers Project Team to provide information as not to delay the programme. The (RFIS) must clearly detail the type of information required and the date on which this information is needed. Every item must be numbered for tracking and identify purposes. The Contractor will manage and update the (RFIS) at regular periods. The team should issue all information on a Submission form 'S' as previously described under this section. The RFIS will be discussed under design development at site meetings.

## 8.7 Change Control Procedure

A Change Control Procedure has been established and is managed via the online Sypro system. The procedure must be completed and formal instruction must be issued before the contractor commences any associated works. This procedure is relevant at any stage of the Project's lifecycle.

## 8.8 Level of Authority

Appropriate levels of authority are detailed in the within the Full Business Case.

# 9 Site Management – Construction Phase

## 9.1 General

Presentation of the site is considered by both the Employer and end user to play an important role and reflects on the corporate/department image and hence public perception. Specific issues to be managed:

- Noise.
- Dust, dirt and debris.
- Removal of debris and soil, cleaning public highways.
- Out of hours working.
- Access and maintenance thereof.
- Hoardings and advertising.
- Maintenance of services, provision of toilet facilities and minimisation of disruption.
- Site personnel around entrance areas (discourage eating and smoke outside entrance).

## 9.2 Access for Inspection by the Client and the Client's Technical Advisors

The Employer and their technical advisors may visit site during normal hours of operation at any time subject to permission of the Contractor, which must be sought before entering the site. If prior arrangements have not been made the contractor may deny access.

All personnel including members of the Employer's organisation must comply with the contractors signing in/out procedures, directions and requirements for personal protective equipment.

# 10 Health And Safety

## 10.1 Policy

The Employer's intention is that all work will be carried out in accordance with the relevant statutory provisions and that all practicable measures will be taken to avoid risk to those who may be affected by the works.

All consultants, contractors and suppliers are required to co-operate with the Employer in carrying out this Policy and must ensure that their own work is carried out without risk to themselves or others.

## 10.2 Construction (Design & Management) Regulations

The Client has appointed a CDM Coordinator in accordance with the requirements of the Construction (Design & Management) Regulations.

## 10.3 Consultants responsibility

The design consultants will carry out a risk assessment relevant to their element of design. These risks should be recorded on a register format with associated mitigation strategy. The residual risks of the project in relation to their design issues should also be identified and issued to the Planning Supervisor for inclusion in the Pre-tender Health and Safety Plan.

## 10.4 Contractors Responsibility – Construction Phase

The Contractor will observe and provide everything necessary to comply with all relevant requirements of the Factories Act 1961, the Occupier's Liability Act *1957,* Control of Pollution Act 1974, Health and Safety at Works etc., Act 1974, Public Health Acts *1875* to 1961 and all statutory requirements or modification thereof and any regulations, rules or orders made pursuant thereto.

The Contractor will be required to report formally, in writing, on Health and Safety matters at each Site Progress Meeting.

Any notifiable accidents or incidents should be reported immediately to the HSE, Project Manager, CA and Planning Supervisor. A written report should be submitted subsequently setting out the cause and circumstances of the incident and detailing the measures the Contractor proposes to take to prevent a re-occurrence.

The Project Manager should be advised immediately of a visit to site by the Health & Safety Executive, and of any notices or directions that have been issued as a result.

## 10.5 Health and Safety File

It is the responsibility of the contractor and consultants to produce the information to be included in the H+S file. It is the responsibility of the CDM Coordinator to ensure that the H+S file is prepared and issued within the agreed timescale and in the appropriate format. The information required for the H+S file is contained in section 10 of this document.

# 11 Completion and Handover

The period immediately prior to handover can be a particularly arduous time for all parties involved in the construction process, including the Employer organisation. Procedures for final inspection of the works are set out in section 9 of this document and will be discussed and agreed between the PM, and the Contractor, in consultation with the Employer's Professional Team. The procedures will take account of the need for early inspection of areas of the works, which will be covered up, and the phasing of final inspections. The Contractor must prepare a co-ordinated programme for phased final inspections and commissioning. The programme will be agreed with the NEC3 Supervisor.

The NEC3 Supervisor has a duty to the Employer to inspect and sign-off the works. The Contractor should satisfy himself before any work is offered that it has been carried out and completed in accordance with the Contract.

The CDM Coordinator will advise the Principal Contractor on the contents and the format of the Health and Safety File at the commencement of the works. The final completed document, prepared by the Principal Contractor is to be issued to the CDM Coordinator for comment and approval prior to issuing to the Employer.

Final issue of the Health & Safety File, including all as-built drawings, operating & maintenance manuals and substantially all test certification shall be a pre-condition of Practical Completion being awarded. (See below). This information below is a guideline of information and the Contractor and Consultants must ensure compliance.

Implementation procedures to deal with the foregoing will be developed by the NEC3 Supervisor and issued to all.

It is anticipated that a Validation/Acceptance Team will be formed to facilitate a smooth and efficient process.

# 12 Dispute Management

Potential disputes between project team shall be communicated to the Project Manager at an early stage. The Project Manager will mediate in any dispute in an attempt to obtain an amicable resolution of the difference.

Failure to resolve the dispute after this process will result in the dispute being referred to the contractual remedy provisions.

Every team member should seek to find co-operative methods of working with other team members

# 13 Publicity and Third Party Relations

## 13.1 Publicity

No material relating to the project will be published or otherwise released by any member of the team without the prior permission of the Employer, which shall be obtained through the Project Manager. This is to avoid prejudicing any provisions of any formal agreement between all parties to the project.

## 13.2 Photography – Construction Phase

The Contractor is required to take regular progress photographs throughout the construction phase of the project and present these bound as part of the monthly report. The primary purpose of the photographs is to record the state of progress of the works at the time, and the photographer should, therefore, be directed as to what should be recorded, not simply left to take 'nice' photographs.

Any problem, or disruption, that occurs should be recorded for the Employer. This will usually mean taking additional photographs to be presented to the Employer. The Project Manager may direct the Contractor in this regard.

Consideration should be given to the use of digital photographic techniques because of the greater ease of storage and retrieval.

## Third Party Relations

All reasonable measures should be taken to develop and maintain good relations with the Local and Statutory Authorities, and any owners of properties adjoining the site or likely to be affected by the development and others who have a legitimate interest in the development.

The strategy for dealing with any third party must be agreed with the Project Manager before an approach is made. This is to ensure a co-ordinated overall strategy is adopted.

# 14 Development Review – Post Completion

The process should be positive and identify improvements to the delivery of future developments.

The Project Manager will be responsible for co-ordinating the review process and all team members will be expected to participate. It is envisaged that the process will take the form of informal group discussions supplemented with one on one interviews, as necessary, culminating in a concise report published by the Project Manager to the Employer. The close out report should make a thorough assessment of all elements of this Project and to draw out or feed back, for the benefit of the client the project team and lessons for application for further projects.

# *PROJECT RACI*

## *Appendix O*

## *Project RACI Stage 1*

This RACI document has been prepared following appointment of Brookfield Construction Ltd. It is intended to assist with development and delivery of the project by identifying within a single schedule key events and actions.

Combined Labs/Hospitals
Board Team
Hospitals Group
Brookfield Team

**R - responsible**
The Individual(s) who performs an activity - responsible for action/implementation. R's can be shared

**A - accountable**
The individual who is ultimately accountable, including yes/no and power of veto. Only one A can be assigned per activity/decision

**C - consulted**
The individual(s) to be consulted prior to a final decision or action being taken. Two-way communication.

**I - informed**
The individual(s) who needs to be informed after a decision or action is taken. One-way communication.

SCOTTISH EXECUTIVE

Health Department
Directorate of Finance

Dear Colleague

**A POLICY ON DESIGN QUALITY FOR NHSSCOTLAND**

**Summary**

1. This letter provides colleagues with a statement of the Department's Policy on Design Quality for NHSScotland (Annex A). Associated with the policy is an Annex of policy guidance (Annex B) which should be reflected in the Design Action Plans and related operational policies of NHSScotland Bodies.

2. The policy requires that each NHSScotland Body appoints a Design Champion at Board level and a supporting Project Officer. Colleagues will already be aware of the requirement to appoint a Design Champion and supporting Project Officer through prior written notification from the SEHD Head of Property and Capital Planning which included a 'person specification' for the role.

**Background**

3. The attached policy statement reflects consultation with colleagues in the Scottish Executive, NHSScotland and Architecture and Design Scotland. It provides a concise definition of policy along with details of mandatory requirements which must be complied with by NHSScotland Bodies, although the Department recognises that these requirements may not be directly applicable to the day-to-day operations of those Special Health Boards which are not actively engaged in the procurement of new healthcare premises and refurbishments to existing healthcare premises.

23 October 2006

**Addresses**

For action
Chief Executives, NHS Boards.
Chief Executives, Special Health Boards.
Directors of Facilities, NHS Boards.
Directors of Estates, NHS Boards.

For information
Chief Executive, National Services Scotland.
Director, Health Facilities Scotland
Scottish Executive Architecture Policy Unit.
Chief Executive, Architecture and Design Scotland.
Chief Executive, Scottish Building Standards Agency.

**Enquiries to:**

Ian Grieve
Property & Capital Planning Division
Property Branch
St Andrew's House
EDINBURGH EH1 3DG

Tel: [redacted]
Fax: [redacted]

4. The fundamental principle opon which this new policy is founded is that all NHSScotland Bodies, as an integral part of the commitment to deliver the highest quality of environment for patient care, ensure that design quality is fully integrated into the healthcare building procurement process and is apportioned appropriate emphasis throughout all stages of this process.

5. Colleagues are advised that although the initial issue of this letter and attached policy statement will be in the traditional 'hard copy' format, the electronic version available from the Publications section of Scottish Health on the Web takes precedence [ www.show.scot.nhs.uk/ ]. This will ensure that colleagues have access to the embedded hyperlinks to online policies, guidance, reference and other material.

**Implementation**

6. The implementation of this policy by NHSScotland Bodies must be supportive of and consistent with all other Scottish Executive policies and associated guidance which impacts upon and, has relevance to, the procurement and management of NHSScotland healthcare facilities.

7. In order to assist the initial implementation of this policy, the Scottish Executive Health Department (SEHD) has entered into a three year Framework Agreement with Architecture and Design Scotland (A+DS), the Scottish Executive's champion for good architecture, design and planning in the built environment to deliver a broad range of services to support NHSScotland to facilitate the design of modern, patient focused health care facilities that create community responsive environments.

8. A+DS will work with SEHD to:

    - raise the level of ambition for good quality design;
    - provide dedicated, hands on assistance to projects in setting the platform for delivering design quality and securing design teams that deliver that ambition; and
    - provide advice on the design quality of proposed healthcare facilities.

9. In broad terms A+DS plans to work with SEHD over the three year period to meet the challenges established in national policy. It plans to use a team of built environment experts to deliver a range of programmes to satisfy Ministers' expectations in relation to healthcare and broader community objectives through:

    - "enabling" projects;
    - establishing and facilitating a Design Champions network amongst NHSScotland Health Boards; and
    - interacting and advising on the design merits of proposals undertaking the Gateway Review process and the Key Stage Review process.

INVESTOR IN PEOPLE
POSITIVE ABOUT DISABLED PEOPLE

SE Approved
Version 1.1

10. In order to enable A+DS to carry out its function, SEHD will:

    - ensure each NHSScotland Board appoints a Design Champion at Board level and supporting Project Officer;
    - refer suitable projects to both the Enabling and Design Assessment strands;
    - provide regular updates of relevant issued policy documents, events and other background information; and
    - arrange a formal review meeting between appropriate staff at SEHD and A+DS following the issue of each annual report and the final report.

11. Awareness and training will be required by NHSScotland on a number of issues in relation to the implementation of this Policy. This will be facilitated in the first instance through the Framework Agreement between SEHD and A+DS whereby appointed NHSScotland Design Champions will be provided with training and support appropriate to their role. It is envisaged that further support will be provided, as appropriate, by Health Facilities Scotland (HFS) through the provision of operational guidance and training via the HFS Continuous Professional Development programme.

**Action**

12. Adressees should ensure that a copy of this letter is cascaded to all appropriate staff withing their area of responsibility.

13. The new Policy on Design Quality for NHSScotland and associated mandatory requirements take immediate effect.

Yours sincerely

[redacted]

# A POLICY ON DESIGN QUALITY FOR NHSSCOTLAND

## Purpose

The purpose of this document is to provide NHSScotland Bodies[1] with a clear statement of policy on design quality. It also provides guidance on how NHSScotland Bodies can ensure that design quality is embedded within the healthcare building procurement process.

## Context

In recent years the value of good design has been increasingly recognised and a wealth of evidence based findings has demonstrated that good design adds value, not only from an economic perspective but also in terms of a range of social and environmental benefits. This capacity to add value is particularly important for healthcare environments, where the physical and psychological well-being of patients, staff and visitors is of paramount consideration.

At a UK level, the Prime Minister established the 'Better Public Buildings' initiative in October 2000 to achieve a step change in the design quality of publicly procured buildings. Following this, in 2001, the Scottish Executive (SE) launched its 'Policy on Architecture for Scotland' which contained an objective "to promote a culture of quality in the procurement of publicly-funded buildings that embraces good design as a means of achieving value for money and sustainable development". Its policy on architecture promotes and encourages investment in well designed buildings in both the public and private sectors.

As one of the early steps in the implementation of its policy, the Executive reinforced the Prime Minister's initiative by taking forward design quality issues within the education sector. The present document now responds to the quality objectives of the Policy on Architecture for Scotland within guidance and initiatives particular to NHSScotland.

As stated in the foreword to the Scottish Executive document 'A Policy on Architecture for Scotland', "*buildings form a fundamental part of our physical environment and the quality of our buildings - of our architecture - has a vital role to play in bringing about the improvements we seek*". This is especially poignant in the context of healthcare building, where well-designed health buildings can help patients recover their spirits and their health and have a positive effect on staff performance and retention, as well as improving the efficiency of operational relationships and providing better value for money in the context of whole-life costs. The Scottish Executive therefore recognises the importance of good building design as the physical means of delivery for a range of wider policy objectives

The Scottish Executive's Architecture Policy Unit (APU), which was established to implement policy commitments, can offer advice on design and acts as the sponsor body for Architecture and Design Scotland, a Non Departmental Public Body established as the national champion for good architecture, design and planning in the built environment.

[1] NHSScotland Bodies in the context of this document means all Health Boards, Special Health Boards and the Common Services Agency performing functions on behalf of Scottish Ministers.

'Designing Places: A Policy Statement for Scotland', launched in 2001, is an Executive campaign to drive up the standard of design in Scotland's towns and cities and sets out the Scottish Executive's aspirations for design and the role of the planning system in delivering these. It aims to demystify urban design and to demonstrate how the value of design can contribute to the quality of all our lives.

'Designing Places' sits alongside the Policy on Architecture. They share an overall aim to improve the life of the people of Scotland through improving the quality of our built environment. Achieving this depends on recognising the value of good design at all scales of development. Individually, buildings accommodate our activities, but collectively they define and shape our towns and cities and have the potential irrevocably to alter the character of our rural areas. A drive for quality cannot, therefore, focus solely on individual buildings - but must be concerned with the way that buildings, new and old, work together, and create places which affect our quality of life.

Health buildings can often be the places in which we may feel at our most vulnerable, whether as a patient, relative or friend. The quality of the building environment that we experience can provide us with calming reassurance or, conversely, it can accentuate our feeling of stress and unease.

Many factors can contribute to engendering a sense of ease, for instance:- the degree of natural light, brightness and airiness, colour and texture, an easily understood layout with clearly defined focal points, uncluttered signage and a clear distinction between the realms of public and private space, maintaining patient dignity.

In many health buildings, external public spaces are vitally important in that they can also provide the opportunity for positive respite in periods of stress. Sensitive landscaping and well-defined public space in a healthcare environment can provide far more than simply an attractive setting. Through careful design social or intimate, tranquil spaces can be created, providing an environment where people might want to sit or meet, and which further contribute to the healing process.

The creation of a new or refurbished facility can also bring with it the opportunity to show a positive civic presence, and the development of a high quality public building can do much to help the regeneration of communities. It is thus also a matter of considerable importance that health buildings respond to the urban or rural contexts in which they sit. This includes considerations such as how they fit within historic contexts, how the approach and entrance act to welcome concerned families and friends, and how they contribute to the quality of their neighbourhoods, both in terms of the buildings themselves and the places they create around them.

Healthcare buildings play a significant part in the environment and, increasingly, patients are becoming "empowered" to demand better environments in which they receive healthcare. It is appropriate that we embrace such matters and introduce appropriate policies and initiatives in Scotland.

At the heart of this policy is the recognition that strong client commitment is required to deliver facilities that provide the high quality caring environments we desire. We are now looking to NHSScotland bodies to develop their individual visions for the kind of places in which patients and staff would wish care to be provided.

**The term 'good design' is not merely a question of style or taste but describes what arises from the intelligent and creative synthesis of many interrelated factors such as: strategic planning of healthcare provision; social and physical regeneration; the local urban (or rural) context and forms; links to infrastructure and transport; sustainability agendas; the building's sense of welcome; intelligibility of layout; security; unobtrusive supervision; ease of use and maintenance; efficiency; and, promotion of human dignity. It covers the way in which buildings sit within and, contribute to, their community as well as how they work and look. Successful healthcare design resolves a wide range of functional requirements efficiently whilst, at the same time, exploring the opportunities to provide an uplifting environment for patients, visitors and staff.**

Design should not be though of as an "add-on extra" in health buildings or, indeed any building. Irrespective of questions of quality, the process of design must in any case take place, as it is an inevitable activity arising from the decision to build. But good design need not cost more and the difference between achieving good or poor quality outcomes is more often the result of having the right knowledge or advice, understanding, care and commitment.

Many aspects of good design are not subjective. A design can be evaluated objectively through the use of appropriate tools such a Design Quality Indicators (DQIs) to assess whether the building will function efficiently and effectively; whether there is clear evidence of thoughtful, imaginative and even inspirational proposals that will not only work, but work better; whether the building integrates with its surroundings in an appropriate manner and creates a sense of place and; whether the materials, construction methods and the proposed layout will enhance long-term value for money.

The physical form of a development can enhance or detract from the qualities of a place and can support or undermine the intended uses. In every part of a city, town or village where there is scope for change there will be a wealth of opportunities for achieving good design. **In order to achieve value for money (VFM), good design has to combine fitness for purpose and flexibility with whole-life costs which is a fundamental requirement of public sector procurement policy.** By integrating a high standard of design quality early in the procurement and design process, cost savings associated with the whole-life revenue costs of a facility can be reduced for a comparatively small additional investment to the capital. In addition to long term operational savings, such well directed initial investment in a high quality healthcare environment helps boost staff morale and improves working conditions, recruitment and retention.

Design evaluation, in particular Post Project Evaluation, can contribute to the emerging field of "evidence-based design" which is proving a valuable tool in the design process towards both reducing costs and improving outcomes. Research has shown that evidence-based design methods, introduced early in the process of facility programming and design can improve the experience of patients who will be treated within the healthcare facility and assist in health recovery which results in improving medical outcomes, shorter bed stays, greater throughput and a reduction in patient and staff stress.

The Commission for Architecture and the Built Environment (CABE), through its work on healthcare buildings, has established key elements of good healthcare design which include the following:

**Good urban design** allowing the building to contribute positively to the urban environment and providing a clear, easy approach that is integrated with public transport.

**Good public open space** where pedestrians are prioritised over cars so that the building is not dominated by landscaping requirements. Well landscaped external space benefits staff,

patients and visitors, offering an alternative environment to rest and relax away from the stresses inherent in healthcare environments.

**A clear plan** with a natural progression from public to treatment rooms. Ideally visitors should be able to see their destination from their starting point.

**A single reception point** makes for a clear expression of the entrance on the outside, an early welcome once inside and assists in orientation when travelling around the building. Security and privacy issues can be resolved in the detail design of the reception area.

**Circulation and waiting areas** that are pleasant and calming places in their own right, designed with human dignity in mind. Where waiting and circulation are combined, this should be achieved to the benefit of each.

**Robust and attractive materials, finishes and furnishings** – structure and detail should all correspond to a clear approach to design, benefiting whole life costs by reduced maintenance and replacement.

**Generous amounts of natural light and ventilation** contributes to good, energy efficient environmental conditions throughout. In addition to providing a comfortable and Therapeutic environment, such provision improves the external feel of the building, provides views out and aids navigation within. The provision of views and positive distraction and the ability to control one's environment have been shown to be instrumental in patient recovery and in staff health and satisfaction.

**Capacity to adapt to future changes** is key to the long-term utility of the building and therefore its sustainability and VFM. Aspects such as sizing rooms generously and arranging them thoughtfully can allow flexibility. Viewing space as a resource, not a territory, helps patterns of use to evolve over time.

## The Way Forward

The recent Scottish Executive Health Department report "Building a Health Service: Fit for the Future" (the Kerr Report) is particularly apt in the context of design quality of healthcare building. The report recognises that the NHS in Scotland needs to change, not because it is in crisis but because Scotland's Healthcare needs are changing rapidly and we need to act now to ensure that we are ready to meet the future challenge. In looking ahead over the next 20 years the report identifies a number of key messages:

- that NHSScotland delivers sustainable and safe local services;
- that we redesign where possible to meet local needs but specialise where required having regard to clinical benefit and access;
- the NHS as a service to be delivered primarily in local communities rather than in hospitals;
- a focus on preventative anticipatory care rather than reactive management.

The report highlights that the new models of care being introduced will have an impact on the services that NHSScotland provides. With public expectations changing regardless of where care is delivered it is paramount that we deliver the highest quality environment for healthcare. Implementing the recommendations will go a long way to ensuring that buildings of a quality which the people of Scotland expect are delivered.

It is critical that design issues are addressed regardless of the procurement method used to deliver healthcare buildings and, that the outcomes specified for these buildings in terms of the care environment are reflected in their design. However, the implementation of design quality and the procurement route used have a particular relationship and therefore the procurement method used can have a significant bearing on the development of design quality during the process. Although it can be argued that good design is independent of cost, it's relationship with design management and procurement in practice needs careful examination. The recently published National Audit Office report "Improving Public Services Through Better Construction" (March 2005) supports this view and advocates that all key stakeholders should be involved and all proposals subjected to independent challenge before key design decisions are made and that design and decision-making be based on "whole-life value".

The concept of 'evidence-based design' has already been mentioned in the context of Post Project Evaluations. There has been a historical assumption that each healthcare building has to be unique in order to fulfil the vision and aspirations of the brief which can, unfortunately, result in the repetition of mistakes, albeit perhaps unintentionally. The starting point for any new healthcare building should, logically, be the successes of one or a number of existing buildings based on a careful analysis of what constitutes the 'good' and what constitutes the 'bad'.

Also of importance is the emerging field of 'supportive healthcare design'[A]. Traditionally, there has been an assumption that the main requirement placed upon a healthcare facility should be the mitigation of infection or the risk of exposure to disease. Additionally, through decades of advances in medical science and technology, many healthcare designers and technicians have been conditioned to create buildings that are successful delivery platforms for new technology. By concentrating on the need for functional efficiency and the pathogenic concept of disease and health, healthcare facilities have been procured which contain environments which can be considered stark, institutional, stressful to their occupants and thus detrimental to the quality of care they are intended to provide. In spite of evidence of the major stress caused by illness and the subsequent traumatic experience of hospitalisation, there has, historically, been comparatively little emphasis on the creation of surroundings which can calm patients, reinforce their ability to cope in such environments and generally address their social and psychological needs.

The process of 'supportive design' begins by eliminating the environmental characteristics which are known to contribute to stress or can have negative impacts on outcomes and, importantly, continues by emphasising the inclusion of characteristics in the healthcare environment which research has indicated have the ability to calm patients, reduce stress and strengthen their ability to cope and promote healthy, healing processes.

(Ref [A]: Ulrich R S, 2000 - 'Effects of Healthcare Environmental Design on Medical Outcomes'
Ulrich R S, 2000 - 'Evidence based environmental design for improving medical outcomes. Proceedings of the conference: *Healing By Design: Building for Healthcare in the 21st Century*', McGill University Health Centre, Montreal)

Due to the length of time that healthcare buildings may be in use there is potential to constrain changes in delivery practices. It is therefore vitally important that design processes are an integral part of a robust procurement mechanism in order to ensure that buildings are not only functional when constructed but are flexible and adaptable over their entire lifetime.

SEHD will continue to play its part in supporting and implementing wider Scottish Executive procurement strategies and policies by setting these within a healthcare-specific context.

## Policy Aims

- The purpose of this policy is to articulate the Scottish Executive Health Department's ambition for NHSScotland's estate and to embed the need for well designed healthcare environments as an integral part of service delivery. It also provides guiding principles which a NHSScotland Body's Design Action Plan should address (Annex B) and two further annexes providing reference to relevant Scottish Executive Health Department property-related policies and supporting guidance (Annex C) and, useful references and web links (Annex D).

- The Scottish Parliament has articulated the desire that Scotland becomes *"the best small country in the world"* and has further asserted that the quality of our built environment is a key factor in achieving this, not only to benefit the country's residents but, to influence the international perception of Scotland. The Scottish Executive Health Department believes that improving the quality of our caring environments is crucial to delivering the confident, compassionate Scotland that is aspired to.

- Therefore this policy statement requires that all NHSScotland Bodies, as an integral part of the commitment to deliver the highest quality of environment for patient care, ensure that design quality is fully integrated into the healthcare building procurement process and is apportioned appropriate emphasis throughout all stages of this process.

## Scope

This policy must be considered alongside other Departmental policies bearing upon property including those for fire safety, property transactions, construction procurement, property management and environmental management. Such policy statements are intended to inform the formulation and updating of operational policies and guidance. Such operational policies and property strategies are important corporate expressions of a NHSScotland Body's intensions and as such should be a manifestation of integrated service planning and the appropriate involvement of all relevant interests.

The policy must also be supportive of other relevant Health Department, Scottish Executive and Government policies and commitments.

## Policy Statements

| | |
|---|---|
| **Statement 1** | All NHSScotland Bodies, as clients, must commit to the integration of design quality in the procurement of healthcare building throughout all stages of the process, regardless of procurement route used. |
| **Statement 2** | All NHSScotland Bodies must have a policy on design quality – a Design Action Plan - consistent with and supportive of the Department's property-related policy and supporting guidance (listed at Annex C) and, with the policy guidance contained within Annex B of this document. |
| **Statement 3** | The SEHD must provide guidance on compliance with those aspects of statutory and mandatory requirements which are particular to the procurement, design and delivery of healthcare buildings and guidance on best practice. This will be effected through the publication of appropriate operational guidance by Health Facilities Scotland. |

## Mandatory Requirements

**1.** Each NHSScotland Board must have a clear, articulated policy on design quality – a Design Action Plan – consistent with the Department's policy.

**2.** Each NHSScotland Board must appoint a member of the NHS Board to act as Design Champion at a strategic level and, where not impractical, also a Senior Officer to act as supporting Design Champion at a technical level.

**3.** All NHSScotland Bodies engaged in the procurement of both new build and refurbishment of healthcare buildings must do so in compliance with EU, UK and Scottish Executive procurement policy and guidance.

**4.** All NHSScotland Bodies, as clients, must ensure the development of a clear project brief which should not only describe the physical requirements of the building but should also articulate the Board's vision and aspiration.

**5.** All NHSScotland Bodies engaged in the procurement of both new-build and refurbishment of healthcare buildings must use and properly utilise the English Department of Health's Activity DataBase (ADB) as an appropriate tool for briefing, design and commissioning. If deemed inappropriate for a particular project and an alternative tool or approach is used, the responsibility is placed upon the NHSScotland Body to demonstrate that the alternative is of equal quality and value in its application.

**6.** All NHSScotland Bodies must use Design Quality Indicator (DQI) tools as appropriate to manage their design requirements through the life of a project. The English Department of Health's Achieving Excellence in Design Evaluation Toolkit (AEDET) and associated supplementary tools such as ASPECT are recognised as the exemplars towards achieving the appropriate level of project design management.

## Monitoring

**7.** All NHSScotland Bodies engaged in the procurement of both new-build and refurbishment of healthcare buildings must conduct thorough and, independent, Post Project Evaluations and Post-Occupancy Evaluations and make available to SEHD any resulting evaluation data which will be used in the formulation of generic reports to inform future policy and disseminate nationally the lessons learned.

## Training

**8.** Awareness and training will be required by NHSScotland on a number of issues in relation to the implementation of this Policy. This will be facilitated in the first instance through the Framework Agreement between SEHD and Architecture and Design Scotland whereby appointed NHSScotland Design Champions will be provided with training and support appropriate to their role and, additionally, through ad-hoc support as deemed appropriate from Health Facilities Scotland.

## Policy Guidance

A NHSScotland Body's **Design Action Plan** should be consistent with and supportive of the guidance contained within this Annex and the policy and guidance documents listed at Annex C.

[The following guidance aligns in part with the Scottish Executive "*Construction Procurement Manual: Section 6 – Design quality in building procurement*" but with appropriate additions and amendments in order to apply to the healthcare context.]

## Contents:

**Design quality in building procurement**

**Role of the client**
**Project brief**
- Activity DataBase (ADB)

**The Client Design Adviser**
**Design Quality Group**
**The Design Team**
- Design Team selection
- Quality Based Designer Selection (QBS)
- Design competitions
- Procedure for appointing the Design Team
- Design Team selection criteria
- Selection criteria at bidding stage
- Relation of selection criteria to budget considerations

**Design quality**
- Evaluating design quality
  - General
  - Achieving Excellence in Design Evaluation Toolkit (AEDET)
  - Using AEDET Evolution
  - When to use AEDET Evolution
  - A Staff and Patient Environment Calibration Tool (ASPECT)
- Role of Architecture and Design Scotland (A+DS)

  - Enabling
  - Design Assessment
- Role of Health Facilities Scotland
- Maintaining design quality on site

**Public space**
**Use of the arts in healthcare**

## Design quality in building procurement

### Key issues

- Good design is not an alternative to value for money (VFM), but is integral to its achievement. A good building project must also contribute to the environment in which it is located, deliver a wider range of social and economic benefits and be adaptable to accommodate the needs of future users. An enhanced built environment which incorporates principles of good design can improve the quality of life of those who use and work in public buildings. Throughout the life of a building, design excellence can improve the standard of public service delivery, make it more efficient and contribute to staff recruitment and retention. Good design can ensure that capital costs are competitive and that savings can be achieved on running costs through reduced maintenance, energy and operating costs without compromising the attractiveness and quality of the building. **Therefore investing in good design can make the most beneficial and effective use of resources, can add value and represents a sound investment in the future. High quality building design is therefore a key mechanism in providing VFM in the provision of healthcare services.**

- **Good design is not merely a question of visual style or personal perception but arises from the careful synthesis of many interrelated factors including architectural vision, functionality and efficiency, structural integrity and build quality, accessibility, security, sustainability, lifetime costing, flexibility in use and a sense of space in the community.**

- Clients must be clear about the level of funds available for a project from the outset and ensure that their aspirations for quality are underpinned by realistic and affordable assumptions.

- Clients must carefully assess and define their priorities before appointing design consultants.

- The process must allow for effective consultation with all stakeholders to establish a clear, well-defined brief.

- Sufficient time and resources should be allocated towards establishing the client's design quality aspirations.

- The Client's Design Advisers must be retained throughout the construction process in order to monitor the quality of design and finishes.

- Post Project Evaluations of building programmes are mandatory for major projects and any lessons learned must be shared with the Scottish Executive and other NHSScotland bodies.

- Quality Based Selection (QBS) is a structured procedure for selecting a design team and professional advisers. Design competitions are a means to primarily select specific design ideas or outline design ideas for a project, rather than the design team personnel.

- All public sector appointments, irrespective of the client's preferred nature of competition or reference to any other guidance on design competitions, must be consistent with EU procurement rules in terms of process and outcome. Public sector clients must ensure that design team appointments follow the procedures described in *Section 3 Annex A* of the works procurement guidance part of the Construction Procurement Manual. Detailed

guidance on the appointment of consultants, conditions of contract and contract guidance in a NHSScotland context is contained within 'PROCODE: Property Procurement Guidance for NHSScotland', published by Health Facilities Scotland. Quality aspects cannot be considered in isolation but must be assessed as part of the VFM evaluation which also takes account of fee proposals.

- The role of an informed client is vital in ensuring the successful delivery of the project within the agreed timescale and budget and to the required standards and requirements of all users.

## Achieving good design

From the outset, clients must be clear about the level of funds available for a project and ensure that their aspirations for quality are underpinned by realistic and affordable assumptions through establishing the right budget. These quality matters and functional requirements must then be set out in a clear and thorough project brief. In order to monitor and control the procurement, design and construction processes, procedures and responsibilities should be clearly defined (and assigned). Ideally, designers should engage in challenging and constructive dialogue with the client, building users and those involved in supplying and manufacturing materials, goods and services. All concerned should work to a realistic and robust timetable, which gives the design team enough time to develop and achieve a good solution.

An informed, demanding and committed client is vital in ensuring that aspirations for quality are maintained throughout the procurement, design and construction processes.

By nature of their complexity, healthcare buildings can be expensive to manage and maintain due the imposition of build cost constraints during the procurement process in order to adhere to a short-term financial hurdle. **It is therefore imperative that the process recognises the need to address the whole-life cycle of the building and the integral part that good design can play in mitigating potential future financial penalties imposed by the adoption of such a short-term vision. Whole-life costing must be the standard for investment decisions. Those involved in the making of such decisions will be ultimately judged on the lifetime VFM of their decisions rather than whether they managed to get a project past the initial financial hurdle.**

Healthcare facilities and the associated equipment used therein must be designed to support all the people who are likely to use them in order to operate effectively. It is therefore vital that all potential users of a proposed facility – staff, public and patients – are involved early in the design process and throughout its progress. Additionally, stakeholders such as regulators, professional bodies, community bodies, etc, should also be engaged throughout the process as this has the potential to provide a valuable source regarding the projected use of the facility, the processes which will be undertaken therein and how the facility's users will work or interact with it. Early user involvement in the design process can help ensure that a planned facility will support the people who are to use it.

The standardisation of systems and processes to be carried out within a proposed facility, layouts, room orientation, human interfaces, wayfinding and even storage can provide many benefits for patients, staff and visitors. Standardisation can help reduce mental workload and thus reduce errors, can make errors and departures from normal working easier to detect and can allow the transfer of skills and staff between departments with reduced training needs. Thus standardisation in conjunction with a wider engagement with users and stakeholders can also enhance safety.

**The Scottish Executive Health Department requires that NHS Boards appoint Design Champions at Board and Senior Officer level to consolidate a commitment to the championing of good design.**

## Fire safety

Fire safety legislation and standards generally state that all people should be evacuated from a building in the event of fire. In terms of healthcare premises, this is not the case due to certain circumstances. Fire in a hospital or other healthcare building can be especially serious because of the difficulties and dangers associated with the emergency evacuation of patients, many of whom will be highly dependent. Therefore in such buildings the concept of progressive horizontal evacuation is the norm and is cited as so within the Technical Handbooks to the Building (Scotland) Regulations 2004. However, because of other special requirements particular to fire safety in healthcare buildings, guidance and recommendations contained in NHSScotland Fire Safety Management guidance, including NHSScotland Firecode, which is additional to the mandatory requirements set out in the Technical Handbooks to the Building (Scotland) Regulations 2004, must be adhered to. This additional guidance is ratified by the Scottish Executive Health Department's Fire Safety Policy. The requirements of NHSScotland Firecode must be considered throughout the design process in addition to the requirements of the Building (Scotland) Regulations 2004. NHSScotland Firecode is published by Health facilities Scotland.

## Designing for equality

NHSScotland, as a provider of services, is subject to equality legislation which requires the provision of services which are accessible to everyone. In a healthcare environment it is important to recognise the complexity and the number of difficulties with which patients, staff and visitors may have to cope on a day-today basis. Sensory impairments, perceptual problems, reduced mobility, chronic pain, communication barriers, are but a few. Informed planning and design plays an important role in enabling people of all abilities access to services and facilities. It is therefore essential that the concept of "access and egress for all" is incorporated early in the design process and throughout its progress and that best practice guidelines are followed. By considering equality issues early in the design process, costs associated with addressing equality issues can be minimised which would inevitably prove more onerous if addressed retrospectively.

Egress for all in the case of an emergency must also be considered during the design process. Everyone rightly expects that if they are in a public building when an emergency occurs they should be subject to evacuation procedures which come into force to ensure their safety. However, in healthcare buildings there may be many persons who, by nature of their presence there or otherwise, may be particularly vulnerable. In particular, in larger healthcare buildings such as hospitals it will not be possible to ascertain the number of people who may have an impairment, let alone the type of impairment or, the number of people who may have cognitive or communication or language difficulties. Addressing the needs of all in the context of emergency egress early and throughout the design process will have significant benefit towards the procurement of a facility which ensures the safety of patients, staff and the general public.

## Evaluating good design

Design evaluation can be structured around a number of key design issues. To support the continual improvement of the construction and procurement process, Post Project Evaluations (PPEs) of building programmes are mandatory for major projects with a cost in excess of the delegated limits and are an integral requirement of the Scottish Capital Investment Manual (currently under review). However, it is recognised that all projects would

benefit from such evaluation and any lessons learned should be shared with the Scottish Executive and other NHSScotland bodies in order to inform best practice and future policies. Independent PPEs should be carried out before the break up of the design team to review the success of the project against its original objectives, its performance in terms of time, cost and quality outcomes and whether it has delivered value for money.

Guidance on Post Project Evaluations can be found within the Scottish Capital Investment Manual.

Post-Occupancy Evaluations (POEs) also have a significant role. The key advantage of POEs is the opportunity to achieve improvements in the ways future buildings will support operational objectives. Participants often identify areas where design improvements could be made and ways in which buildings and equipment could be used more cost effectively. These may only be minor, but they could produce significant benefits to future designs. The process of evaluation can provide important feedback on whether resources are being targeted at the most important areas. This can also enable poorly functioning or seldom used features to be eliminated from future designs and the repetition of mistakes to be avoided.

The nature of PPE and POE reports must be set out and agreed at the start, and project sponsors must ensure that provision is made for the independent preparation of both when setting budgets and timetables.

PPEs and POEs can be valuable in the formulation of “evidence based design” methodology. As has been stated in the preambles to this policy document, the field of “evidence-based design” is proving a valuable tool in the design process towards both reducing costs and improving outcomes. Research has shown that evidence-based supportive design methods, introduced early in the process of facility programming and design can have significant impact on the design of physical environments which can affect patient medical outcomes and care quality. An important impetus for the growing international awareness of healthcare facility design has been mounting scientific evidence that certain environmental design strategies can promote improved outcomes whereas other approaches can worsen patient health.

## The business case

The business case process must include statements of expectation for design quality. The preparation of the Outline Business Case should be the starting point for embedding design quality issues into the procurement process and, ideally this should be initiated during Phase II of the Business Case process at the point from which service objectives are established, as defined within the SEHD Scottish Capital Investment Manual (currently under review). Discussions with professional advisers at the earliest stage can assist in determining and defining design priorities and setting project objectives. Consideration of the design issues must continue throughout the entire process.

For projects which are to be provided under the Private Finance Initiative (PFI) the guidance contained within the Department of Health publication ‘Design Development Protocol for PFI Schemes: Revision 1’ (August 2004) should be followed, in so far as it is applicable in Scotland, for the preparation of Business Cases.

## Role of the Client

The key role of the client is to develop a clear, well defined brief. At the beginning of the project, the client will need to establish the nature and scale of what is required. Clients should establish the views and aspirations of all stakeholders, and their aims will become the

reference point throughout the design and construction stages and can be used to test the overall success of the project over the long term. As with any building project, the initial stages are vital and, a period when the most value can be added. Providing sufficient time and resources for strategic thinking will produce dividends in the long run. An informed and motivated client is critical to the success of a project.

As part of their responsibilities, the client must:

- fully develop a client strategy which has identified the need for the building whilst setting and securing a budget for the project. Understand that the budget cannot be finally established until the brief is settled;
- set a realistic and achievable timetable allowing sufficient time for consultation, brief development and for design;
- involve their Design Champion throughout the briefing and project delivery and listen to their comments;
- allocate sufficient time and resources to establish the client's design quality aspirations and set out clear benchmarks which the client must reinforce through all stages of the process;
- consider the skills and experience required of individual client team members, assess in-house skills and, where necessary, engage external consultants;
- appoint a Client Design Adviser to aid in the preparation of the brief and the assessment of the schemes that come forward through any competitive design process;
- consult with stakeholders to establish a clear, well-defined brief;
- be informed and demanding about operational requirements and quality objectives to get the best possible outcome from the procurement process;
- articulate the Board's requirements not only through the use of DQIs but in a clearly expressed brief that establishes and communicates their vision for the development;
- show commitment to achieving a well-designed and constructed project by giving design quality a high percentage in the assessment of bids and publishing that ratio. Make sure that bidders understand that poor or mediocre developments are not acceptable;
- establish clear and effective routes for communication between the Client Team and the bidding Design Teams during the bidding process so that the Board's needs and aspirations can be more fully discussed and incorporated into the designs that are brought forward. Establish a Design Quality Group to work with the bidders throughout the ITN process, commenting on and directing the solutions that are brought forward;
- choose a Delivery/Design Team which is committed to achieving the best quality possible within the agreed budget and timetable; allow sufficient fee budgets for the work that the designers must do;
- not allow design time to be squeezed in order to recover time lost in the programme for other reasons – good design takes time;

- carry out Post project Evaluations (PPEs) and Post Occupancy Evaluations (POEs) and ensure that the reports from these are available to SEHD for formulation of generic reports which can properly feed back into future procurement processes.

## Project Brief

A vital factor in achieving high quality design is that clients have a firm and well developed view of what they want, before appointing design consultants, and that this is clearly stated in project briefs. A well-developed brief, with common consensus on operational and quality priorities, is essential for the provision of better design. A rigorous approach to this stage of work will significantly improve the client's capacity to deliver a quality project.

On the other hand, proceeding with sketchy and under-investigated assumptions can be detrimental to the outcome of the project. Statements that set out the client's aspirations on design in terms of matters such as character and durability should be incorporated into briefs.

Detailed guidance on the development of the Project Brief is available to NHSScotland Bodies from within PROCODE: Property Procurement Guidance for NHSScotland, published by Health Facilities Scotland.

Of particular importance in the context of healthcare buildings is the need for the Project Brief to incorporate policy, guidance and best practice in relation to reducing Healthcare Associated Infections (HAI). Guidance to ensure that prevention and control of infection issues are identified, analysed and planned for at the earliest stage of the provision of new or refurbished healthcare facilities Is contained within Scottish Health Facilities Note 30 (SHFN 30): 'Infection Control in the Built Environment: Design and Planning', published by Health Facilities Scotland. Additionally, Health facilities Scotland has developed a system which aims to assess and manage the risk of infection in the built healthcare environment called HAI-SCRIBE, an acronym for Healthcare Associated Infection System for Controlling Risk in the Built Environment. HAI-SCRIBE has been designed as an effective tool for the identification and assessment of potential hazards in the built environment and the management of these risks. The tool should be applied from the design and planning stages of a project through to the occupation and operation of the facility.

The project brief should also contain statements on the client's desired approach to sustainability. Integral to the design and procurement process, a commitment to sustainable design can bring real benefits in terms of reduced running costs and quality of environment for users. Further guidance on achieving sustainability in construction procurement is set out in the SEHD Environmental Management Policy for NHSScotland and in Section 7 of the Scottish Executive Construction Procurement Manual.

To assist NHSScotland Bodies in delivering sustainable solutions and embedding energy efficiency into healthcare building projects, Health Facilities Scotland has developed an exemplar Environmental Management System, GREENCODE, through which NHSScotland Bodies can continually aim to improve the environmental performance of their property and, exemplar energy efficiency guidance, En$CO_2$de, which aims to ensure that everyone involved in procuring, managing and using healthcare buildings and equipment thinks about the implications of energy use.

## Activity DataBase (ADB)

Activity DataBase (ADB) is the briefing, design & commissioning tool for both new-build and refurbishment of healthcare buildings. It is a briefing and design package with an integrated

textual and graphical database, an interface with AutoCAD and an extensive graphical library - the complete tool for briefing and design of the healthcare environment.

ADB is produced by the Department of Health in England and is endorsed for use in Scotland by the Scottish Executive Health Department as the preferred briefing and design system for NHSScotland. It has been developed to assist in the construction, briefing development, design and alteration of healthcare facilities.

In 2005, the Scottish Executive Health Department, in association with the NHSScotland Property and Environment Forum (now Health Facilities Scotland) launched an initiative to support NHS Boards in the implementation of ADB throughout NHSScotland by way of a national agreement in which SEHD would fund the first year's licence subscription to ADB and Health Facilities Scotland would provide ongoing training and user-network support. This is now in place and NHS Boards, having recognised the merits and cost-effectiveness of the system, are expected to continue to subscribe annually on their own behalf.

Spaces designed using ADB data automatically comply with English planning guidance (such as Health Building Notes (HBNs) and Health Technical memoranda (HTMs) as ADB forms an integral part of the English guidance publication process. Whilst Scottish users can create their own project-specific briefs and designs using ADB's extensive library of integrated graphics and text which includes room data sheets, room layouts and departmental room schedules, extreme care should be taken to ensure that such data generated by the package are consistent and compliant with Scottish-specific guidance such as Scottish Health Planning Notes, Scottish Hospital Planning Notes (SHPNs) and Scottish Health Technical Memoranda (SHTMs) as published by Health Facilities Scotland.

## The Client Design Adviser

The first few decisions at the start of a project can have a very significant impact on the quality of the design. The challenge is to break the mould of 'fixed thinking' which too often leads to projects which are not the best solution possible. By employing a Client Design Adviser (CDA) early in a project, clients can become empowered to question fundamental issues. The interface between the project team and the users can be effectively smoothed by the CDA – healthcare officials are in the main not trained to read design plans which often results in buildings being 'signed off' which fail to reach their potential. The appointment of a CDA is, naturally, an additional cost but good preparation is vital to the creation of a good project.

The CDA is appointed by the Client as a consultant to the Client Team and operates in the sole interest of the client to achieve best value outcomes through design. However, healthcare buildings often constitute complex engineering systems, the design and maintenance of which must be addressed at the design stage. Also, many of the key issues surrounding healthcare building design are irrevocably connected with sustainability. It is vitally important, therefore, that the CDA is capable of understanding the range of issues and has the ability to provide the necessary breadth of input.

The CDA acts from the inception of a project through to its completion, performing a range of tasks to help ensure that the healthcare buildings delivered are of the highest quality including:

- contributing to the understanding and knowledge of design;
- reviewing user needs and assisting in the preparation of the outline brief;
- drafting documentation;

- judging the quality of ideas and suggestions;
- suggesting and evaluating delivery team members;
- asking searching questions of all those involved in supply; and
- facilitating consultation with stakeholders.

## Design Quality Group

The Client needs to ensure that all schemes designed in the competitive process up to Invitation To Negotiate are acceptable. In order to ensure this, it is advisable to set up a Design Quality Group to review the designs alongside the user consultation process. The group should be kept small and will normally be made up of the Project Director, Building Project Director, Client Design Adviser and some input from the A+DS Enabler, if appointed.

A typical format for a Design Quality Group review would be:

- bidders submit designs beforehand and Group members review them privately;
- the Design Quality Group meet to discuss the designs and formulate any questions to clarify, in order;
- the Group meet with the bidders and hold a brief Q & A session;
- Group members then collate and agree on comments which are subsequently fed back to bidders, normally on the same day.

This entire process can be carried out in a matter of a couple of hours per bidder, and ideally would be done at 3 points during the ITN process. The three meetings would follow a similar format, but have slightly different objectives:

- the first is arguably the most important, being carried out before the design becomes fixed in peoples' minds;
- the second is useful to see how the bidders have listened to and, taken account of, the group's comments; giving an indication of their partnering abilities;
- the third meeting, just before the designs are fixed, is a good time to test the bidder's grasp of costing issues and whether there is duplication or superfluous space in the design.

It is important that bidders are aware beforehand that it is the fundamental issues which will be considered – they shouldn't appear at review meetings with 'completed' designs! Bidders should view the review as an opportunity to learn about the client's reaction to their proposals rather than using the time to justify their design as it stands.

## The Design Team

### Design Team selection

There are several methods of selecting the appropriate design team for a project, including Quality Based Designer Selection (QBS) which is a structured procedure for selecting a

design team, and design competitions, which primarily select specific design ideas or outline designs for a project, rather than the design team personnel.

The Scottish Executive's Construction Works Procurement Guidance: Section 3 – Procurement Strategies and the Appointment of Consultants and Contractors provides information on some of the different procurement strategies available and the consultancy roles and professional advice that may be required at the various projects stages. Further advice is contained in the Guide to the Appointment of Consultants and Contractors published by the Office of Government Commerce.

**Detailed guidance on the appointment of consultants, conditions of contract and contract guidance in a NHSScotland context is contained within PROCODE: Property Procurement Guidance for NHSScotland, published by Health Facilities Scotland.**

Regardless of the procurement strategy adopted, the appointment of a design team, consultants, professional advisers, etc, should be based upon the principles adhered to in Quality Based Selection methodology, outlined below. The Royal Institute of British Architects (RIBA), together with the Construction Industry Council, has published a booklet of Guidance for Clients to Quality Based Selection.

## Quality Based Designer Selection (QBS)

QBS looks for an appropriate balance of design skills, experience, innovation, and an ability to perform on schedule to the required standards and within budget. A client, or client committee, selects a team based upon a weighted scoring of a list of relevant factors, including technical capacity, resources, previous experience of similar projects, deliverability of the design and partnering arrangements, aimed at determining which design team is most able to handle the project successfully.

Throughout a building project, designs will be developed through constant dialogue with the design team, so it's essential that a key selection consideration is inter-personal skills; the client must feel that it has the ability to work with the designers.

It is essential to know that a design team's claimed expertise is actually currently available. The question of whether a design team has completed major quality projects within the past five years may give a more fair comparison between long established and new design teams. It is important to ensure that the principal designer responsible for successful past projects is present for the interview, and such individuals should be named in the contract if that design team is successful.

## Design competitions

A competition to select an outline design, rather than the design team members, requires the client to have a well developed brief for the project. Design competitions may be appropriate where there is either a unique problem that will benefit from a wide range of design approaches being explored (along with likely considerable public interest - which may be the case on a major new public building) or where the competition promoter wishes to encourage the development of new talent.

## Procedure for appointing the Design Team

All public sector appointments, irrespective of the client's preferred nature of competition or reference to any other guidance on design competitions, must be consistent with EU procurement rules in terms of process and outcome.

The appointment or competition must therefore:

- strike the correct balance between quality and price to achieve whole-life VFM;
- evaluate the quality and price aspects against clear, unambiguous and pre-determined criteria;
- assess the technical and financial capacity of the design team (including design partnership arrangements) to deliver the project on time and within budget, as well as to the required standards of quality; and
- maintain a full and transparent record of all aspects of the competitive process from start to conclusion, including the evaluation of the pre-qualification questionnaires as well as the selection and award stages.

NHSScotland Bodies must follow the guidance on the appointment of consultants contained within Section 2 of PROCODE: Property Procurement Guidance for NHSScotland. Also, as Public Sector clients, NHS Bodies must ensure that design team appointments follow the procedures described in *Section 3 Annex A* of the works procurement guidance part of the Scottish Executive Construction Procurement Manual which sets out appropriate criteria to use at both the selection (short listing) and award (bidding) stages of the appointment process, as well as indicative quality: price evaluation ratios for different types of project.

## Design Team selection criteria

Selection criteria should include design ability, aspiration, financial status, insurance provisions and technical capacity; the last of these enables consideration to be given to resources, technical suitability and past performance. This stage also aids production of an objective and transparent short list of the most suitable organisations, from all those that expressed interest in providing design services.

## Selection criteria at the bidding stage

The award criteria enables a further qualitative assessment to be made of the specific proposals for the project - not just technical merit of the design proposals but also other aspects of successful delivery such as proposed team-working, management arrangements, and project team organisation.

Where design partnerships are proposed - perhaps to combine the innovative skills of a new or small design practice with the experience and resources of a longer-established designer - the award criteria enables the client to assess the ability of both parties to fulfil their responsibilities and to evaluate the compatibility of working cultures and practices. Visits to the design offices of all candidates, including those forming partnerships, should follow a consistent approach and involve the same personnel.

NHSScotland Bodies, as clients, should consider the benefits to be accrued from requesting an Interim Bid Submission from bidders, particularly in a PPP or joint venture (such as “hub”) initiative context. This should be based upon clearly specified requirements within the Invitation To Negotiate (ITN) documentation and should be undertaken at an approximate mid-point stage through the period from release of OJEU to the return of ITN documentation with clear expectations on outputs from bidders that are measured but, not too cumbersome, perhaps structured by means of the use of the AEDET Evolution design evaluation tool.

### Relation of selection criteria to budget considerations

The qualitative criteria adopted at the selection and award stages should be appropriate for the individual project and weighted to suit the circumstances. It is important that these aspects aren't considered in isolation but should be assessed as part of the VFM evaluation which takes account of fee proposals. Section 3 Annex B of the Scottish Executive Construction Procurement Manual describes other aspects of appointing consultants, including the various ways of paying for professional services. In circumstances where *ad valorem* (usually percentage) fee structures are appropriate, consideration must always be given to the application of an abatement or capping mechanism in order to contain fee costs at a fair and appropriate level.

Criteria used during selection and award stages must be applied consistently by all of those involved in that stage of the procurement procedure. In other words, once selection and award criteria are established, individual members of a sift or tender evaluation panel must not apply different criteria. Furthermore, once selection criteria are established, they should be made available to candidates. Award criteria must be set out in either the OJEU contract notice or the contract documents.

## Design Quality

### Evaluating design quality

#### General

There are, inevitably, some aspects of what constitutes 'good design' that can be subjective, but these are primarily issues of style. However, many other design issues can be assessed objectively - whether a building will function efficiently and effectively; whether there is clear evidence of thoughtful, imaginative and even inspirational proposals that will not only work, but work better; whether it responds positively to its surroundings; whether it provides well-defined and meaningful public spaces for patients and the community; and whether the materials, construction methods and the proposed layout will enhance long-term value for money. The Scottish Executive Construction Procurement Manual: Section 6 – Design quality in building procurement lists a number of key issues to be considered in evaluating a design.

General guidance on achieving value for money (VFM) in works procurement, based on seeking to achieve an optimum combination of whole life cost and quality, is set out in Section 2 of the Scottish Executive Construction Procurement Manual. Evaluating and achieving consensus on quality can be facilitated through the use of formal techniques and there are a number of tools which can help. The Construction Industry Council (CIC), for example, has developed its Design Quality Indicator (DQI) to evaluate the design quality of buildings throughout the development and life cycle of a project.

#### Achieving Excellence Design Evaluation Toolkit (AEDET)

However, healthcare building design frequently involves complex concepts which are more difficult to measure and evaluate. In order to address these specifics in a DQI context the Department of Health (England) Estates and Facilities Directorate has developed the **Achieving Excellence Design Evaluation Toolkit (AEDET)**, the latest version of which is AEDET Evolution and is a tool specifically directed towards achieving excellence in design rather than ensuring compliance with legislation, regulation and guidance. High scores in AEDET do not therefore necessarily guarantee compliance with statute.

The AEDET Evolution toolkit assists NHS Bodies in managing their design requirements from initial proposals through to post-project evaluation. It is a benchmarking tool and forms part of the guidance for PFI, joint ventures including 'hub' and, conventionally funded schemes. AEDET Evolution contains evaluation criteria which ensure that design takes place within a common, industry wide framework. The toolkit enables the user to evaluate a healthcare building design in a non-technical way that covers the three key areas of **impact**, **build quality** and **functionality**.

AEDET Evolution uses ten key criteria that have evolved from sources including the Commission for Architecture and the Built Environment (CABE) and the Construction Industry Council (CIC) to establish an industry-wide framework for assessing design. The ten key criteria are:

**Uses**
Service philosophy, functional requirements and relationships, workflow, logistics, layout, human dignity, flexibility, adaptability and security.

**Access**
Vehicles, parking, pedestrians, disabled people, wayfinding, fire and security.

**Spaces**
Space standards, guidance and efficient floor layouts.

**Character and innovation**
Excellence, vision, stimulation, innovation, quality and value.

**Citizen satisfaction**
External materials, colour, texture, composition, scale, proportion, harmony and, aesthetic qualities.

**Internal environment**
Patient environment, light, views, social spaces, internal layout and wayfinding.

**Urban and social integration**
Sense of place, siting, neighbourliness, town planning, community integration and landscaping.

**Performance**
Daylight, heating, ventilation, air conditioning, acoustics, passive thermal comfort.

**Engineering**
Emergency systems, fire safety, engineering standardisation and prefabrication.

**Construction**
Maintenance, robustness, integration, standardisation, prefabrication, health and safety.

## Using AEDET Evolution

AEDET Evolution is a tool for evaluating the quality of design in healthcare buildings. It delivers a profile that indicates the strengths and weaknesses of a design or an existing building. It is not meant to produce a simplistic single overall score. Because of the nature of design, which inevitably involves trade-offs, it may not be possible to produce a building which would have the maximum score for all the sections. Indeed it may quite often be the case that a high score for one statement reflects a design which inevitably may be scored

low on another statement. A single overall score would thus be misleading and uninformative.

AEDET Evolution can either be used by individuals or in workshops by groups. In the latter case it is probably desirable that an experienced user of AEDET Evolution should facilitate the group to avoid excessively lengthy debate. AEDET Evolution can be a helpful tool in enabling a group to come to a common understanding with the help of a facilitator who can moderate group discussions.

AEDET Evolution can be used at different 'scales' in evaluating the design of a healthcare building, e.g. at a building scale, a department scale or a complete site scale. The level of detailed information available may dictate the scale of the evaluation.

AEDET Evolution is designed to be used by those involved in the commissioning, production and use of healthcare buildings. In particular public and private sector commissioning clients, developers, design teams, project managers, estates/facilities managers and design champions may find AEDET Evolution a helpful and useful tool. User clients such as patient representatives and members of the general public should also be able to use AEDET albeit within a workshop environment alongside other more experienced professionals.

## When to use AEDET Evolution

AEDET Evolution can be used to evaluate existing buildings in order to compare them or understand their strengths and weaknesses.

AEDET Evolution can be used on the plans for new buildings in order to evaluate and compare designs.

AEDET Evolution can be used on "imaginary" buildings in order to set standards for preparation of a brief.

AEDET can be used at various stages during the design of healthcare buildings – as the level of detail of the information available increases it should be possible to respond to more of the statements in the tool. AEDET Evolution can also be used in the preparation of Interim Bid Submissions (see " Selection criteria at the bidding stage" above).

## A Staff and Patient Environment Calibration Tool (ASPECT)

To complement AEDET Evolution, the Department of Health (England) Estates and Facilities Directorate has developed the ASPECT toolkit. ASPECT stands for A Staff and Patient Environment Calibration Tool and is based on a database of over 600 pieces of research. That research deals with the way the healthcare environment can impact on the levels of satisfaction shown by staff and patients and on the health outcomes of patients and the performance of staff.

This research and the ASPECT toolkit itself are set out under 8 headings. ASPECT can be used as a stand alone tool, or it can be used to support AEDET Evolution to provide a more comprehensive evaluation of the design of healthcare environments.

When used to support AEDET Evolution it enables the user to score the Staff and Patient Environment Heading of AEDET Evolution in a more detailed, accurate way.

The toolkit has 3 layers which allow users to create a design evaluation profile:

- the SCORING layer on which you score;

- the GUIDANCE layer that gives more detailed help;
- the EVIDENCE layer that points to available research evidence.

## Role of Architecture and Design Scotland (A+DS)

Architecture and Design Scotland has been established by Scottish Ministers as the National Champion for Good Architecture, Design and Planning in the built environment. Its aim is to operate within the Executive's policy framework on architecture and design, as well as in partnership with a range of bodies in the private and public sector to help turn the aspirations of policy into reality.

The aim is to raise the quality of new development, so that high standards of layout and design are the rule, not the exception. Overall, the development of well designed and attractive cities, towns and villages will support Ministers' determination to make Scotland a better place to live, work and visit.

A+DS has taken over the independent Design Review and Advisory roles of the Royal Fine Art Commission for Scotland and has a wider and more proactive role in advocating the benefits of good design through Enabling, Advocacy, Research and Communications activities.

Projects of strategic significance, making a significant impact on the local environment, or particularly sensitive sites or setting new standards for the future will be considered within the A+DS independent Design Review process through meetings with a Design Review Panel.

The role of A+DS is to be proactive in promoting the qualities and benefits of good design by:

- inspiring excellence in all kinds of development from housing estates to major cultural buildings.
- encouraging high quality public buildings (e.g. schools and hospitals) and public places.
- stimulating and supporting a demand for better design by clients and the public for improved quality from investors, developers and the design professions.
- working in partnership with local authorities, government agencies, professional bodies, non-government organisations and where appropriate local communities to develop effective design policies, frameworks and guidance.
- improving skills and design in the built environment through training, by working with universities and professional bodies.
- communicating and disseminating key messages, in a clear and accessible form, on architecture and design to a wide audience, including the media.
- building up evidence which demonstrates the value of investment in good design.
- considering new thinking on how the built environment needs to respond to drivers such as climate change, the sustainable development agenda, technological advances and demographic changes.

SEHD and A+DS have developed a range of initiatives to assist NHSScotland in addressing design quality issues in the procurement of healthcare building projects. These initiatives include:

- training and advocacy to support the introduction of Design Champions within every NHSScotland Board;
- enabling by providing "hands-on" assistance to projects; and
- carrying out assessments of the design merits of significant projects to advise and inform the Gateway Review and Key Stage Review processes.

## NHSScotland Design Champions

The Scottish Executive Health Department requires that NHS Board Chairs are responsible for nominating a member of the NHS Board and a Senior Officer to take on the roles of Design Champions for the Board. The Senior Officer should have knowledge and experience in capital investment procedures and expertise in technical matters. Both must be in a position to influence the overarching policies, procedures and ethos of the organisation, albeit in their own manner.

A Design Champion should be:

- well respected and an excellent communicator who is able to promote the need for good design to a wide variety of audiences, both within the Health Board and externally. Both appointees should be able to persuade colleagues and the wider community of the benefits of well designed healthcare buildings;
- a consensus builder, able to bring together the various stakeholders both within the local authority and the wider community; and
- able to see the 'bigger picture' and help develop a 'vision'.

The Design Champions, ideally, are in a position to influence the work undertaken by the Health Board but it is important that the roles are not created for status but, for action.

The role of the Design Champion is not project specific but is to advocate design quality and to ensure that mechanisms are in place within the NHS Board to deliver the design agenda. NHS Design Champions will be supported initially by Architecture and Design Scotland through a Framework Agreement with the Scottish Executive Health Department which requires A+DS to:

- establish and facilitate an NHS Scotland Design Champions Network;
- provide an induction pack for use by the NHS Scotland Design Champions Network's members to assist them in undertaking their duties as design champions;
- hold at least two NHS Scotland Design Champions Network events per year.

Design Champions will be expected to work with all the necessary disciplines. The role of the Design Champion is expected to include a responsibility to ensure that:

- the building promotes civic pride;
- patients and staff are consulted and their views addressed;

- the building fits into the local surroundings and settings;
- the building is fit for purpose;
- the building takes on board modern technology;
- the design considers sustainability issues;
- quality is questioned throughout the process;
- there is support for resisting change which reduces quality and VFM.

The Design Champion should ensure that:

- aspirations for design quality underpin all projects undertaken across the NHS Board;
- a Board Design Action Plan is produced and delivered;
- a design vision is established in order for the Board to produce clear briefs within which these aspirations are clearly stated;
- all procedures encourage the achievement of high quality design;
- an assessment is made of the current environment for patients, staff and visitors;
- the Achieving Design Excellence Evaluation Toolkit (AEDET) is used throughout a project where appropriate;
- the evaluation of tenders is based on VFM and not lowest cost;
- budgets and timetables are realistic;
- the Board has the correct skill mix to deliver the design agenda;
- the scheme includes the full involvement of the local community and the support of clinical and other staff.

The Design Champion will raise the profile of design excellence by:

- encouraging the selection of designers with a proven track record of good design or design awards;
- promoting awareness of national and international best practice in healthcare design;
- encouraging schemes, either refurbishments or new build, to be put forward for local and national competitions and awards;
- maintaining a forum for regular review and feedback to the Board;
- recognising the support, guidance and initiatives available.

It is important that NHS Boards acknowledge the fact that the role of Design Champion is one that requires a considerable amount of time. Design Champions are required to

understand what constitutes good design across a range of different and, sometimes very technical, disciplines and the amount of time required to do so can easily be underestimated.

## Enabling

Enabling seeks to provide dedicated hands-on assistance to those charged with delivering a project or establishing the policy framework for the delivery of other projects. At its very basic level enabling seeks to influence that project's particular outcome so that the chances of achieving design quality are enhanced. However, the enabling process seeks to work at a much deeper and broader level by imparting the skills, capacity and confidence to the client team so that design quality can be raised in each successive project.

Architecture and Design Scotland provides enabling advice which is delivered by A+DS staff and by leading professionals working as consultants for A+DS. The enabler's involvement is generally at the outset of the design and briefing process, before the appointment of a design team or a developer.

The A+DS enabling work supports commissioning organisations in their aspirations for design quality, championing the highest standards in urban design, landscape, architecture and regeneration - with the aim of achieving better- designed spaces and places. It assists public building programmes to secure good value for money by providing direct advice on critical areas that impact on the final design of the project. These are issues such as project vision, client resources, briefing, and competitive selection of design and developer teams.

The enabling service also contributes to the overall understanding of procurement processes and best practice in built environment and public space projects.

SEHD will work with A+DS to identify a number of key projects to enable and this work will be funded through the initiative. Thos NHS Boards which are embarking on the first major project for some time or, a project that presents particularly difficult design issues, may also wish to consider approaching A+DS to assist in:

- embedding the qualities of good design in the procurement process;
- providing early hands-on advice;
- the development of the brief;
- exploring key design issues.

## Design assessment

Currently, project approval mechanisms focus on how a building is procured with less emphasis on the merit of what is to be procured. Design Assessment is intended to balance this so that 'why' we build and 'what' we build can be seen alongside 'how, in making the decision to build.

Design Assessments will be carried out at 3 key points during selected projects to look at the merits of what is proposed. The information that may be assessed will depend on the project stage and procurement route but is likely to include a number of the following aspects:

- the quality and content of the briefing information prepared;
- the impact of the chosen procurement procedures (timetables, submission requirements etc.) on the development of design quality;

- the site options and appraisals that have been carried out;
- any Public Sector Comparator design that has been developed;
- the proposals to be submitted for Outline Planning Consent;
- proposals brought forward as part of the bidding process for Design & Build and PPP/PFI schemes;
- early proposals under development by appointed Design Teams.

Design Assessments will be carried out by a team established by A+DS. A representative of the assessment team and a report detailing the Assessment Team's conclusions will be available to Gateway Review Teams and to PartnershipsUK to aid their evaluation of the project.

## Role of Health Facilities Scotland

Health Facilities Scotland (HFS) is a division of National Services Scotland and provides operational guidance to NHSScotland Bodies on non-clinical topics such as:

- estates engineering;
- building and architecture;
- procurement;
- fire safety;
- environment;
- energy;
- property management;
- clinical waste management;
- sterilisation;
- legionella and other estates related pathogenics;
- hazards and safety action notices.

This assists the NHSScotland meet the Government's policy and strategic aims and to establish professional/technical standards and best practices, including the promotion of new initiatives in the field of healthcare practice and management. Clearly HFS can have a pivotal role to play in the implementation and support for this Policy, both through the provision of supporting guidance and through their Continuous Professional Development (CPD) programme which provides essential training to NHSScotland personnel on operational issues as impacted by national policies and objectives.

## Maintaining design quality on site

There is a risk that, once a project moves on to site, the client may underestimate the effort which will continue to be required to maintain design quality. Any shortcuts taken at this stage can put the overall design quality of the project at risk. The client's design advisers must be retained throughout the construction process in order to monitor the quality of design and finishes.

These advisers should also ensure that design aims are not sacrificed in the management of change during the running of the project. If design standards and quality thresholds are clearly defined, then the review process throughout the delivery stage should provide sufficient safeguards against quality dilution. A structured process of quality checks during construction is important to ensure that what has been agreed is actually being provided. All partners should be involved in these checks as the risks of unsupervised changes on site can affect a wide range of matters, such as the provision of resource areas necessary for facilities management and the quality of finishes, which in turn may affect both cleaning and maintenance.

## Public Space

A statement setting out the Executive's aspirations for design and the role of the planning system in delivering public spaces is described in the published document Designing Places: A Policy Statement for Scotland.

It is important that public space is not considered as an afterthought. New public buildings need to be responsive to their contexts, both in terms of their scale and form, and in the materials they use. It is not enough to simply respond to the appearance of surrounding buildings; it is important to also think in terms of the integrity of surrounding public spaces. In the creation of new public buildings, it is important that the design team is perceptive of the buildings' relationships to the maintenance or improvement of existing public spaces or the potential for new public spaces.

The creation of public buildings can also give something positive to the public realm rather than simply create residual areas around them, and clients may wish to consider whether the location of a building is sufficiently sensitive to merit the inclusion of an urban design specialist on the team. An approach is required which gives due consideration to the way in which the spaces created by buildings will be used, and to the needs of users in terms of accessibility, safety, lighting, shading, shelter, orientation, views, surfaces, seating, planting, and maintenance.

## Use of the arts in healthcare

There may be scope for the involvement of artists or craftsmen in a project. When successfully implemented, artworks can help to create more distinctive and attractive buildings and urban spaces and enhance the public's experience of an architectural space. In a healthcare perspective, artwork can have an even more positive effect. NHSScotland can benefit in many ways from the adoption of the arts in healthcare programmes including better patient environments and an improvement in staff morale. It is recognised that art in healthcare can benefit the NHS through the promotion of user and staff involvement in the design of the healthcare environment and can subsequently have an impact on health outcomes. There is growing evidence that patient recovery rates and stress levels are improved by the adoption of appropriately selected art in healthcare programmes. The integration of art can also assist in improving the communication of health information and the redesign of services. The involvement of staff, patients, artists and local communities at

the earliest stages of the design process for new buildings and refurbishments can result in innovative, creative solutions.

The use of art in a healthcare setting need not be restricted to the visual arts. Other arts activities which involve music, performing arts, storytelling and patient workshops can have therapeutic benefits and can have great value in certain healthcare environments. Art-related therapy, e.g. dance, music, drama or art creation, is recognised as an integral psychological and creative tool for the improvement of physical and mental well-being.

Some NHS Boards retain the services of “artists in residence”. However, Boards may also wish to seek specialist advice from public art agencies with regard to including artwork within a project.

Boards may wish to consider allocating a specific budget for the inclusion of artwork as an integral element of a project. However, care should be taken to ensure that any resulting expenditure is proportionate to the benefits and is appropriate to the building's status and function, in order to avoiding subsequent criticism of the project for inappropriate use of public funds.

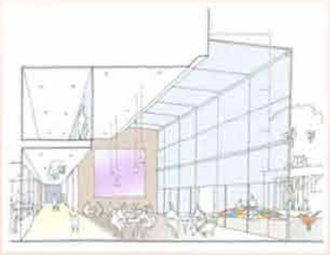
## Design Solution Report July 2007



NHS
Greater Glasgow and Clyde

A49342285

New South Glasgow Hospitals

Design Solution Report

1.0 Introduction (E1 PITN)

1.1 Overview of Design Solution Report
1.2 Nature and Purpose of Design Solution
1.3 Strategic Context
1.4 The Scope of the Design Solution and Summary Conclusions

2.0 Design Analysis (E2 PITN)

2.1 Appreciation of the Design Brief and Model of Care
2.2 Appreciation of Site Constraints and Site Analysis

3.0 Design Proposals 1 – Hospital Organisation (E4, E5, E7 part, E8, E9, E10 PITN)

3.1 PSC as a response to Health Care Planning
3.2 The Design concept
3.3 Site Planning Strategy and assumptions
3.4 Building Organisation
3.5 Vertical & Horizontal organisation
3.6 Flexibility and Expansion
3.7 FM Organisation
3.8 Public Realm and way finding
3.9 Security and Control
3.10 Key Departmental layouts

4.0 Design Proposals 2 – Urban and Social Integration (E6 PITN)

4.1 Massing and Urban Integration
4.2 Materials and Elevation
4.3 Landscape design
4.4 PSC fit with Outline Planning Application (OPA)

5.0 Design Proposals 3- The Hospital as Human Environment (E3 part, E7 part PITN)

5.1 Character and Innovation
5.2 Patient Comfort
5.3 Staff Environment
5.4 Public and Private space
5.5 Relationship to wider Environment
5.6 Design Quality

6.0 Design Proposals 4 – Compliance, Build Quality and Engineering (E3 part, E11, E12, E13, E14, E16, E17 PITN)

6.1 Fire Strategy
6.2 Structural Strategy
6.3 Services Strategy

7.0 Construction and Implementation – (E15, E18, E19, E20, E21, E22, E23, E24 PITN)

**7.1 How construction phase would be managed - Considered Construction**
**7.2 Health and Safety and CDM**
**7.3 Demolition and Managing Waste**
7.4 Phasing
7.5 Prefabrication in Design
7.6 Standardised Construction
7.7 Robust Construction
7.8 Maintenance
7.9 Life cycle Maintenance and Costs
7.10 Capital Costs

Appendices

- Appendix A- Architectural Drawings
- Appendix B- Mechanical & Electrical Drawings
- Appendix C- NEAT Assessment
- Appendix D- Civil & Structural Drawings
- Appendix E- PSC Area Summary vs. SoA

This design report was produced on behalf of the NHS Greater Glasgow Trust by The Trust Advisory Team. Architectural input by Avanti Architects Limited. Structural input by SKM. Services input by Max Fordham. Life cycle and Cost input by Davis Langdon. Health Planners Directions Consultancy.

Section 1 - Introduction

1.1 Overview of Design Solution Report

This Design Solution Report supports the Stage 1 Public Sector Comparator (PSC) for the New South Glasgow Hospitals Project. The New South Glasgow Hospitals comprise a new Adult Acute Facility which forms part of the rationalisation of secondary healthcare provision resulting from the pan Glasgow "Acute Services Review" (ASR), and separate replacement facilities for the Royal Hospital for Sick Children which currently operates from the Yorkhill site on the north side of the river. The New South Glasgow Hospitals will occupy the site currently occupied by the existing Southern General Hospital (SGH).

Work carried out by the Board has identified buildings that must be retained in the medium and long term to operate alongside the new facilities. In particular the existing Maternity and Neurosciences blocks must be retained for the foreseeable future and linked physically to the new Hospitals. The existing Hospital buildings on the site must continue to operate while the new facilities are being constructed. Phasing studies have therefore been undertaken to plan the demolition and construction programme for the PSC design. These phasing arrangements are included in the design solution report.

The Design Solution Report and Accompanying Redevelopment Options Appraisal Report, together with the Design Brief and other support documentation and the Outline Planning Application, aim to provide future development partners with a comprehensive introduction to the project.

1.2 Nature and Purpose of Design Solution

The Design Solution Report describes the Design Exemplar [1] development process including the selection of the preferred redevelopment design option [2] and the production of the OBC stage PSC. It describes how the PSC responds to the briefs developed for both hospitals[3].

The Exemplar Design was commissioned by the Greater Glasgow and Clyde Health Board and managed by the New South Glasgow Hospitals Project Team. With the assistance of the Project Team, the Design Solution presented in this report was prepared by the New South Glasgow Technical Advisors (TA) Team which includes:

| | |
|---|---|
| Davis Langdon | Project Managers and Lead Consultant |
| Avanti Architects | Architectural Consultants |
| Directions Consultancy | Health Planners |
| SKM Anthony Hunts | Civil and Structural Engineers |
| Max Fordham | Mechanical and Electrical Engineers |
| Davis Langdon | H&S and Planning Supervisor |
| Davis Langdon | Cost Consultants |

The TA team have also been supported by Keppie Planning, JMP and Ironside Farrar concerning aspects of the project linked to the separate Outline Planning Application (see below).

It is recognised that the specific design solution represented by the PSC is only one possible design solution that could be adopted in response to the site and the brief. It is the Board's intention, however, that the design is one that is both robust and logical and will therefore provide bidders with a good foundation on which to build their own proposals. In particular it is intended that the strategic planning of the site master plan will stand the test of time because many of the principles of this plan have been included in the outline planning application.

In describing the reasons behind the specific design decisions taken by the Board, reference is made to instances where choices were made between differing objectives and where, because of conflicting requirements, some objectives could not be fully realised. A typical example of such conflict might be the desire to include more space in the design against the desire not to exceed a given financial budget. The intention in identifying these conflicts or potential deficiencies in the PSC, is to assist bidders in understanding the Board's broader priorities so that their own design teams can bring a better understanding to the development of their own proposals. The Board will encourage bidders to bring new and innovative ideas to the ongoing design process to make it possible to realise their overall ambitions for the project more fully.

Every effort has been made by the Board and its advisors to ensure that the information included in this report is accurate and compliant with the brief, statutory requirements and current good practice, but they cannot accept responsibility for any errors, oversights or inconsistencies that may have escaped their attention. Bidders are therefore required to check the accuracy and suitability of any ideas or information taken from the report for use in their own proposals.

A commentary is also provided in Section 4.4 which assesses parity between the proposals forming the PSC and the Indicative Design included in the Outline Planning Application (OPA)[4].

1.3 Strategic Context

The New South Glasgow Hospitals form Phase 2 of the Board's Acute Services Review (ASR)[5]. The ASR addresses a number of challenges that Glasgow faces in modernising its acute services, these include:

Outdated buildings, unsuitable and unfit for modern healthcare - 21st century healthcare in 19th century buildings.
Inpatient sites which are unable to provide the one stop / rapid diagnosis and treatment models for the large volumes of patients treated in Glasgow hospitals;
Fragmentation of care as patients are required to move around sites and different buildings.
Unsuitable diagnostic and imaging facilities
Increasing sub-specialisation in medicine
Glasgow's role in teaching and research and the links with the universities
Too many inpatient sites requiring emergency on call rotas on each site
Changes in doctors' training

The final configuration of acute services will be as follows:

Three adult inpatient acute sites at Glasgow Royal Infirmary, new South Glasgow site and Gartnavel General Hospital
Two A&E/ Trauma units at Glasgow Royal Infirmary and New South Glasgow Hospital
An Acute Receiving Unit for GP referrals at Gartnavel General Hospital
Five Minor Injuries Units at Glasgow Royal Infirmary. New South Glasgow Hospital, the New Stobhill and Victoria Hospitals
Two new hospitals at the Stobhill and Victoria Infirmary sites providing ambulatory care
Two maternity units at the Southern General site and Glasgow Royal Infirmary
A new Children's Hospital co-located with a maternity unit on the New South Glasgow site

The New South Glasgow developments are therefore a critical component in delivering the necessary improvements to clinical facilities to deliver a new Model of Care for Glasgow as a whole. The co location of children, adults and maternity on one site, the "Triple Gold Standard", presents a unique opportunity to deliver a fully integrated, inclusive environment which contributes positively to staff and patient well being in clean and modern surroundings. The Board wish to deliver a landmark development that will contribute positively to the local context and be viewed with pride by the people of Glasgow. It will meet the aspirations of patients and staff and provide an attractive, functional and quality environment to support the development of clinical excellence.

1.4 The Scope of the Design Solution and Summary Conclusions

The Board appointed a team of suitably experienced advisors to form their Stage 1 TA Team following an OJEU advert in 2005. During the Stage 1 pre-Outline Business Case (OBC) phase the TA Team assisted the Board in the preparing their draft Brief and carried out a series of redevelopment option studies[6]. After consultation with various user groups a preferred configuration was selected in October 2006. This was developed further to form the Stage 1 PSC illustrated in this Design Solution report.

The Design Solution therefore illustrates the proposal that has developed since the selection of the preferred option. The Design Solution compromises:

Written descriptions
Diagrams
Site plans including site circulation and landscape strategy
Adjacency plans
Selection of 1:200 plans of key departmental areas
Services strategy including example layouts
Structural strategy including example layouts
3 dimensional massing studies

[1] The Design Solution and Design Exemplar are interchangeable terms which are equivalent to the Public Sector Comparator Design (PSC) and Design Exemplar Solution as defined in The Design Brief Framework for PFI Public Sector Comparators at OBC Stage and The Design Development Protocol for PFI Schemes respectively, published by the DoH.
[2] Refer to separate Avanti Architects Redevelopment Design Options Appraisal Report Nov 2006.
[3] Refer to NHSGG&C Design Brief
[4] Refer to OPA documents April 2007
[5] For further details on the 2002 ASR visit Greater Glasgow and Clyde website.
[6] Refer to separate Avanti Architects Redevelopment Design Options Appraisal Report Nov 2006.

A NEAT assessment has been prepared and is included in Appendix C.

Updated Capital and Lifecycle costs have been produced together with an accompanying commentary.

The PSC has been tested to assess its functional, technical and financial viability. The Design Solution Report aims to identify where deficiencies are known to exist or difficult issues that have been identified.

The PSC Design Exemplar as described in this report, together with the Site Redevelopment Options Appraisal that preceded it, has been the result of a considerable amount of work on the part of the Board and the TA Team. The result sets out a strategy that provides good clinical adjacencies and supports the new Model of Care within the constraints set by the site and the retained buildings.

The Design solution is not intended to be prescriptive but seeks to identify for future partners the design issues, balances and compromises that have been considered when preparing the OBC.

Section 2 – Design Analysis

2.1 Appreciation of Design Brief and Model of Care

The clinical brief for the New South Glasgow Hospitals has been framed in the context of the Pan Glasgow ASR. The adult acute development on the SGH site does not just represent upgrading of existing facilities. It also sees the transfer of acute activities from the Victoria Infirmary and Western Infirmary. The New South Glasgow will be home to one of the two acute Emergency Departments planned for the City.

The Pan-Glasgow strategy will see more non-acute day activity being carried out in the two ACADS at the Victoria and Stobhill sites. This accounts for the relatively low proportion of adult Outpatient services in the New South Glasgow development.

The Pan-Glasgow strategy involves the centralisation of other support services including, Laboratories, Pharmacy, CSSD, Stores, Production Catering and Laundry Services. All of these centralised services, with the exception of Laboratories, will not be located on the South Glasgow Site.

The PSC and OPA have made some very broad allowance for the Laboratories (inc. new City Morgue) which it is understood will be integrated in the new build, although subject to its own OBC. Further briefing work and design testing will be required during the next stage to explore the relationship of this with the site and the PSC proposals.

The brief for Pharmacy and other Facilities Management (FM) also requires further clarification and testing. At this stage the PSC has made assumptions in respect of these services that have yet to be confirmed.

2.2 Appreciation of Site Constraints

Redevelopment of the existing site is complicated by the presence of existing buildings, many of which have to be retained in use during the construction of the new hospitals until such time as the replacement accommodation is fully commissioned or, as is the case of Maternity and Neurosciences, have to be retained and integrated clinically in the final scheme. Such considerations are not unusual in many other hospital redevelopments but the positioning of these two retained facilities on opposite sides of the site presents an immediate challenge.

2.2.1 Identifying Sites for Future Development

Much of the strategic thinking to create the new development site was undertaken by the Board at the time of the original ASR and, in the case of the Children's Hospital was subject to the Calder Group's subsequent Report in 2006[7]. Central to the strategy for both hospitals was the identification of a combined development site on the area of land in the centre of the existing Southern General site that is currently either vacant or occupied by ancillary buildings suitable for early decanting.

The Board have committed to the new Children's Hospital being delivered as quickly as possible. This results from the loss at Yorkhill of the direct link to a maternity unit when the existing Queen Mother's Hospital closes. The need to re-establish the Children's link with a maternity unit underpins Yorkhill's relocation to this new site and the urgency surrounding its programme.

The Board's plan is to prepare the central area on the existing Southern General site to enable the New Children's, Adult Acute and Laboratory facilities to be built in a single continuous operation. In the case of the Children's Hospital and Laboratory block, the Board expect these to be handed over before completion of the Adult Acute facility. As such, both Children's and Labs must be designed to allow their independent operation from the point of handover.

These requirements underpin the Board's strategy to locate the new Children's Hospital immediately adjacent to the Maternity Building. The link between the two would be formed around the new Neo Natal unit that is being constructed under a separate contract associated with other upgrading and improvement work to the Maternity block itself.

The new development site is underlain by a number of existing services. However, the SGH facilities team have put in place a plan to decentralise the existing services to ensure the new development site is unencumbered prior to the start of the build phase. This includes the rerouting of the Linthouse Burn culvert passing north south through the site to run under the line of the retained (albeit modified) road. Further details are provided in the phasing and services sections below.

[7] Refer to Greater Glasgow and Clyde Website for details of ASR and Calder Group Report.

2.2.2 Boundaries and Access

The present SGH site provides limited opportunity to open up new road access points. The Victorian Hospital was originally accessed from the east, with gates set in line with the existing listed clock tower building. This section of Moss Road was turned into a dual carriage way when the Govan Tunnel approach was created in the early 1960s. The main vehicle site access then moved anticlockwise to the north to open off Govan Road.

Options to enter the site from the east are therefore limited to pedestrian and cycle points. The TA team considered whether the eastern end of Langland's Road, currently blocked off, could be reopened for emergency access. Preliminary discussions with the Roads Authority indicated that a left turn may be possible but the presence of the existing underpass would make this difficult to achieve. A right turn would not be permitted.

Subsequent work questioned the value of reopening this entrance as most ambulances coming from the south are understood to enter from the existing Hardgate Road entrance to the west. In the case of ambulances coming in off the motorway, a back route is available (and frequently used) from junction 25 along the Fifty Pitches Road which avoids any congestion on the tunnel approach. In this case a new left turn off the approach seemed to offer little benefit.

The southern boundaries adjoin the existing residential areas and no new access from this end can be formed without acquiring property outside the site.

The western end of Langland's Road forms the junction with Hardgate Road, adjacent to the existing Maternity Building. The main route through the site links this entrance with the main Govan Road entrance.

The PSC proposes two further new entrances:

The first entrance already exists off Govan Road but is rarely used. This leads to an unmade track running behind the existing outpatient and therapy areas hard against the boundary with the water treatment works.

The PSC proposes that this be opened up to provide an early site works access and in the longer term a dedicated route in and out for delivery and service vehicles. This route can also be used by undertakers' vehicles to allow discrete access to and from the site avoiding public areas.

The existing track would be constructed properly and during the first stage passing places would be provided. Once the new hospital opens and the existing buildings along this edge are removed a second track can be formed to provide clear in and out routes either side of the existing tree line. This allows the existing tree screen to be maintained in the long term.

The second new entrance will open further north off Hardgate Road. The intention is that this would link with the existing Govan Road entrance to provide the main public entrance and exits from the site. Public Transport services described below would follow this new route.

The remaining Hardgate Road entrance would be retained to serve Maternity and the buildings at the south end of the site. A route is still retained from north to south along the line of the current road between Neuroscience and the new adult hospital but through traffic will be discouraged by the use of shared surfaces and other traffic controlling measures. Historically speed bumps have not been used on site because of the presence of Spinal Injuries. Any new proposal must therefore ensure that a level flat ambulance route to Spinal Injuries is maintained along Langland's Road.

The existing road route will, in any event, suffer future head height restrictions resulting from the proposed link to Neuroscience. The existing first floor in Neuroscience houses the theatres and critical care areas. The new hospital therefore requires to link directly with this floor. Unfortunately, the first floor of Neuroscience is not level with the first floor of Maternity. The PSC has set the first floor of the new buildings to run through with Maternity and the new Neo Natal extension, both of which provide the higher of the two possible datum's. The option to run the new first floor level with Neuroscience and rise up to maternity was rejected as it would result in an inadequate floor to floor dimension between ground and first in the new Hospitals. Even so, the clear head height under the link will still only be approximately 3.6m.

The intention is to run across level to the new circular feature in front of Neuroscience. This will accommodate a potential staff rest area together with a short flight of steps and two bed platform lifts to drop down level with Neuroscience first floor.

Plans showing proposed vehicle, pedestrian and cycle routes and access points are shown below in Figures 3 and 4.

Section 3 – Design Proposals 1 – Hospital Organisation

3.1 PSC as a response to Health Care Planning

The New Adult Acute Hospital presents an unusual challenge in the large volume of inpatient accommodation compared with that for outpatients. This demands a greater degree of centralisation with the significant proportion of the overall footprint dedicated to integrated intensive acute facilities.

The Children's hospital provides a more conventional balance between Inpatient and Outpatient activity. The Royal Hospital for Sick Children has an international reputation for the quality of service it provides and will continue to operate as a hospital in its own right with its own clinical staff and management. It is therefore a requirement of the brief for the Children's hospital not only that there should be an appropriate degree of clinical and patient separation between the two hospitals but also that the distinct identity of the Children's hospital shall be maintained both externally and within the patient and public areas.

It is acknowledged, nonetheless, that there are a number of potential synergies that can be exploited through the co location of the adult and Children's hospitals and a great deal of consideration has been given to identifying these in the brief and in the design of the two hospitals.

The Option appraisal exercise associated with OBC considered separate buildings for the Children's and Adult's facilities but this was viewed as more costly and provided less future flexibility should one or the other have to expand or contract in the future. The land-take for two separate buildings would also be greater. The PSC therefore proposes a single overall footprint subdivided into the adult and Children's facilities, effectively creating two "semi-detached" hospitals.

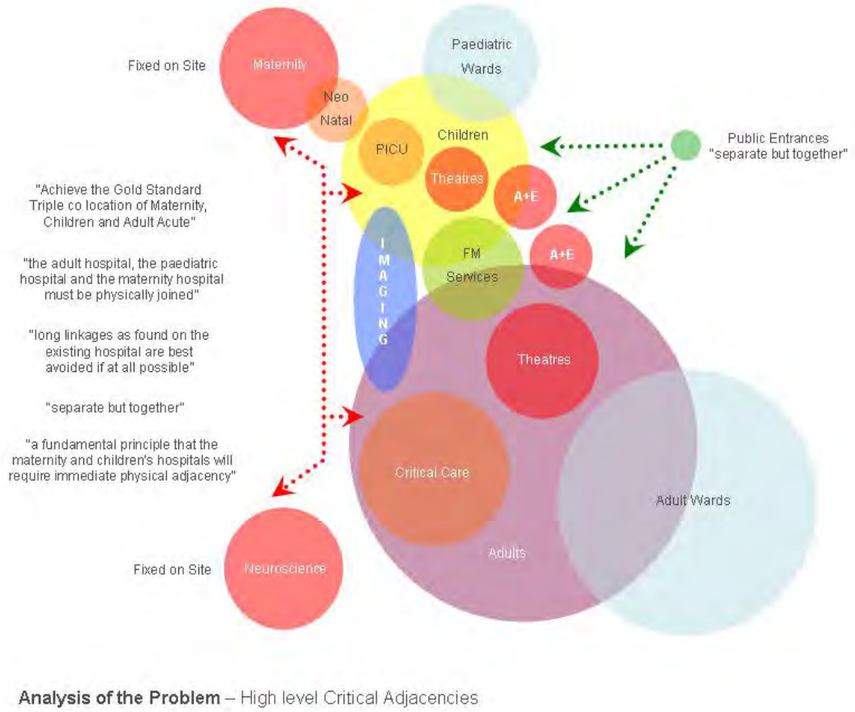
A managed "hot route" is provided that links both the adult and Children's hospitals to the Neurosciences and Maternity Blocks. In this respect the PSC responds to the requirement in the brief to separate "hot" routes from "cold" routes and to some extent the FM routes. Hot describes intensive clinical areas used essentially by staff for the treatment and movement of inpatients. Cold describes areas where members of the public will be self presenting such as Emergency Department (ED) walk in entrances, Outpatients and visitor access areas. FM routes are those routes that are reserved for support FM services within the hospital.

A development of this size will require careful management of access, security and infection control. The separation of these routes throughout both hospitals will serve to enable staff to move about safely and securely and will avoid vulnerable inpatients coming into casual contact with visitors moving through the building. However, to achieve this, the PSC requires a higher proportion of communication space than would be found in more traditional health care facilities where a greater degree of sharing is tolerated.

One area in which there is an important synergy between the adult and the Children's hospital is in the provision of shared FM services. Both hospitals are provided with dedicated FM lifts which connect to a common FM services compound via a basement service route. There are, therefore, both limited clinical and integrated FM links connecting the two hospitals but there will be no public connection between the two hospitals within the buildings themselves.

The size and scale of the new facilities has led users to consider breaking down a number of departments into smaller more manageable areas. Radiology is a particular case in point where both the Children's and Adult's departments have been disaggregated in the PSC to place specific services closer to the activities they support and to provide better separation between inpatients and outpatients. This is discussed in more detail under Building Organisation below.

3.2 The Design Concept



**Analysis of the Problem** – High level Critical Adjacencies

Figure 1 illustrates the core PSC departmental adjacencies across both hospitals.

The new Children's Hospital provides an immediate physical adjacency to the Maternity Building linking via the new Neo Natal Unit. It is this Neo Natal linkage between Maternity and Children which will be lost when the Queen Mother's closes and, as noted above, the need to re-establish this key relationship has been the principal reason for the relocation of Yorkhill to the South Glasgow site. Here is an example of where a relatively small department has had a significant impact on the overall PSC strategy.

The Neo Natal linkage will be at first floor level and will link through directly to the Paediatric Intensive Care Unit (PICU) and Children's theatres. This in turn determines the location of the Children's ED department on the ground floor immediately below to provide short vertical links to both theatres and PICU.

Significant discussion has taken place with clinicians to consider the relationship of the separate Children's and Adult's ED departments and a variety of different options were considered examining this one point alone[8]. To date an overarching concern has been legibility for users and the potential confusion that could arise from two public ED entrances on one site. Concern was raised that emergency public entrances separated by any distance could lead to adults mis-presenting in an emergency at Children's or visa versa with limited opportunity for simple redirection. The PSC solution proposed here places these entrances close to one another and although separated, the opportunity exists to pass patients quickly between their respective reception areas.

This relationship governs the position of the adult ED and in turn the adult theatres and critical care adjacencies immediately above. A link at first floor level across to Neurosciences must be provided to link the existing specialist Neuroscience theatres and critical care, also at first floor, to both the new adult acute and Children's hospitals.

The PSC proposes the location of the new core facilities, together with the limited outpatient areas, in a 2 to 3 storey "plateau" arranged to sit between the existing Neurosciences and Maternity blocks. The inpatient ward accommodation for both hospitals is then arranged vertically above the plateau in two separate elements, one for adults and one for children, which are completely unconnected at the upper floor levels. Both of the ward elements have a different and smaller footprint to the plateau below in order to maximise their perimeters and provide all inpatient rooms with views out and natural daylight. Particular care has been taken in the design of wards to take advantage of the fine views that can be gained from upper storeys on the site and to avoid views into fully enclosed courtyards. The size and layout of the two ward elements are very different, reflecting the different requirements for adults and children. The detailed adjacencies and PSC ward arrangements are discussed in more detail below.

The plateau, which is cut through by courtyards, provides a compact plan with good multiple adjacencies suited to an integrated acute facility. This is the opposite of the existing SGH model which relies on independent linked buildings. Users wish to avoid a new development of linked buildings, in favour of an integrated build, where at all possible.

3.3 Site Planning Strategy and Assumptions

The strategic positioning of the PSC's new built elements is largely determined by the land available for a single phase continuous build in the centre of the site. However, the PSC makes a virtue of this necessity by bringing together the acute activities into the site's core and providing the link between Maternity and Neurosciences. It also allows the new buildings to concentrate their increased height and massing away from the immediate site boundaries.

This strategy allows both new hospitals to be constructed whist the existing SGH continues to operate – see phasing section below. Once the new hospitals are complete and operating, the existing hospital buildings not scheduled for retention in the longer term can be removed to allow either space for future acute expansion, landscaped open space or other associated Health development - see Figure2.

The Campus Plan and Design Statement submitted with the Outline Planning Application explain the broader site strategy and landscape design in more detail and should be referred to here[9].

During the Option Appraisal stage alternative site layouts were tested. The preferred option was assessed as achieving the best balance of the different requirements for accessibility & way finding, separation of adults and children and quality of external environment.

Summarising these as follows:

Accessibility and external way finding: Given the boundary constraints and the limited opportunity for creation of new access points a strategy that assumes approach via either Govan Road or Hardgate Road was maintained. The PSC assumes the creation of the second access point off Hardgate Road to link through with the main Govan Road access. These two entrances would be signed as the main site entrances for the adult and Children's hospitals and would also be the main entry and exit points for public transport services to assist way finding. The creation of this link road allows the remaining site roads, and particularly that running north south between Neurosciences and the new adult hospital, to be "de-stressed" in traffic terms to improve the wider site environment.

Public Transport stops would be provided on the new link road and a separate dedicated route for the future FASTLINK service is run close to the new buildings. This service, if it is implemented, will run at 6 minute intervals and will therefore have a more limited impact in terms of noise etc. The link road carrying general traffic is positioned away from the new hospitals to protect the immediate environment around the building entrances.

Two main multi-storey car parks are proposed adjacent to the separate adult and Children's entrances to reduce walking distances from parking spaces to the main entrances. Extensive surface car parking was rejected at an earlier stage when the enormous land take required was assessed. It was felt that such an arrangement would be far too deleterious to the quality of the external environment on the site.

Vehicle, pedestrian, cycle and emergency ambulance access are shown on Figures 3 & 4 Projected Car Parking numbers around the site are shown on Figure 5.

[8] Refer to separate Avanti Architects Redevelopment Design Options Appraisal Report Nov 2006.

[9] Refer to New South Glasgow Hospital Campus Plan, Design Statement and other Outline Planning Application documents April 2007.

Separation: A key consideration when developing the PSC has been the need to balance clear site way finding for all against the need to provide a degree of separation to both hospitals. In particular, the Board wishes to achieve some separation of the approaches to each hospital in order and to allow each hospital to have its own external space around the main entrance.

The PSC proposes placing the main adult and Children's entrances at opposite ends of the combined buildings' north faces. From here they are both clearly visible from the new road linking between Govan and Hardgate Roads and from the public transport stops. A new public open space is created in front of the Hospital which both entrances overlook. Although this forms one open area, the space would be landscaped to provide discrete areas associated with the different entrances. A welcoming play area sits in front of the Children's entrance whilst the adult entrance enjoys a more formal setting. Both can lead out into the central area which accommodates balancing ponds and habitat areas. This new space will form the public heart of the redeveloped site and a new urban space with which the frontage of both new hospitals will be identified.

The bulk of future FM deliveries would come and go via a separate route off Govan Road. This would follow the line of the existing unmade lane running behind the existing SGH outpatient's block. As noted before, this route would be widened and split into two lanes either side of the existing mature trees running parallel to the boundary. From this area deliveries can be stored and taken into the building via the new basement route under the open space – see Figure 6 and 05017-GA - -01 , or alternatively broken down and moved at surface level to the existing buildings that are not physically linked to the new build.

Emergency Ambulance access to the new hospitals is via an ambulance entrance on the south face off the existing Langlands Road. This route is already established as the one that currently provides ambulance access to Maternity and serves to bring together the blue light access for both New Hospitals and Maternity. This arrangement prevents the ambulance activity disrupting the main entrances, and visa versa, and ensures that the drop off is screened from main public view. The separation of the public walk in ED entrances and the Ambulance entrance has been subject of much discussion with the client. This is described under the Building Organisation and department headings below.

External Environment: The Board have set out their strong desire to improve the overall site environment as part of the redevelopment process. Consultation with user groups and the public have reinforced the need to enhance and develop the landscape qualities of the site.

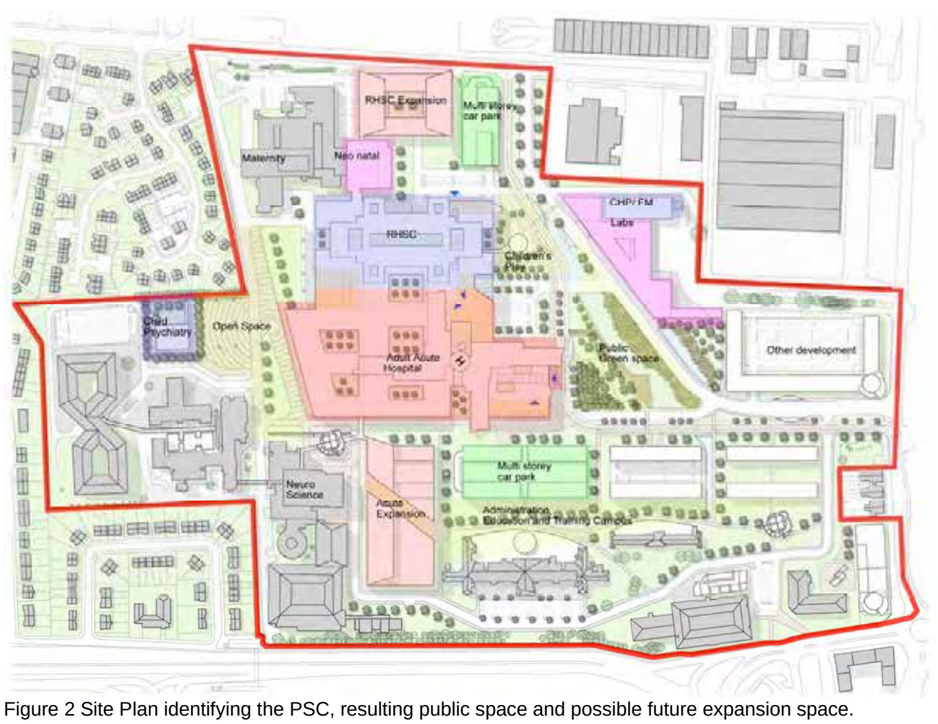


Figure 2 Site Plan identifying the PSC, resulting public space and possible future expansion space.

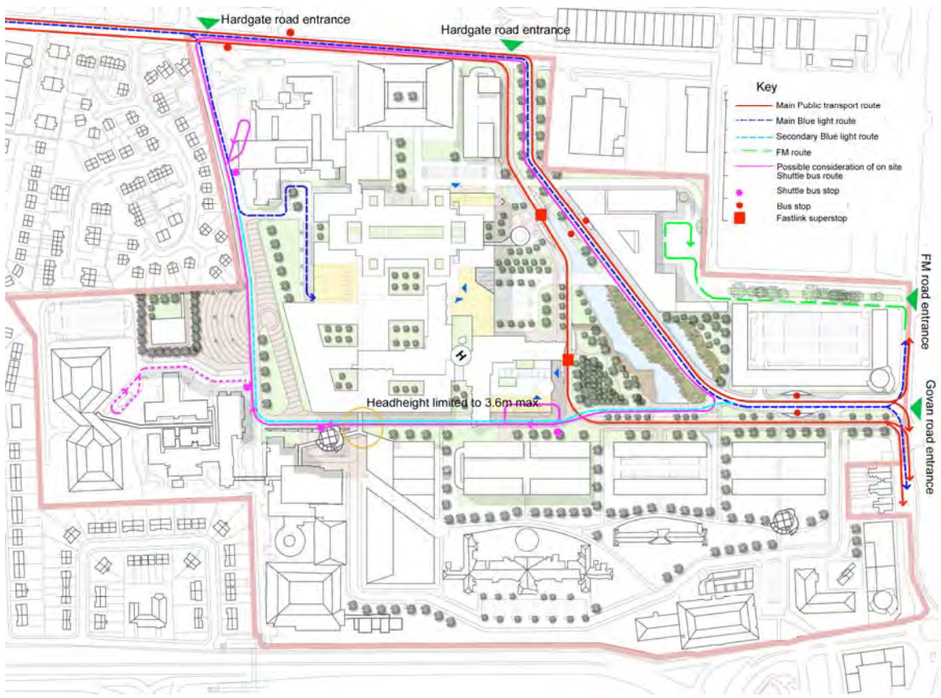

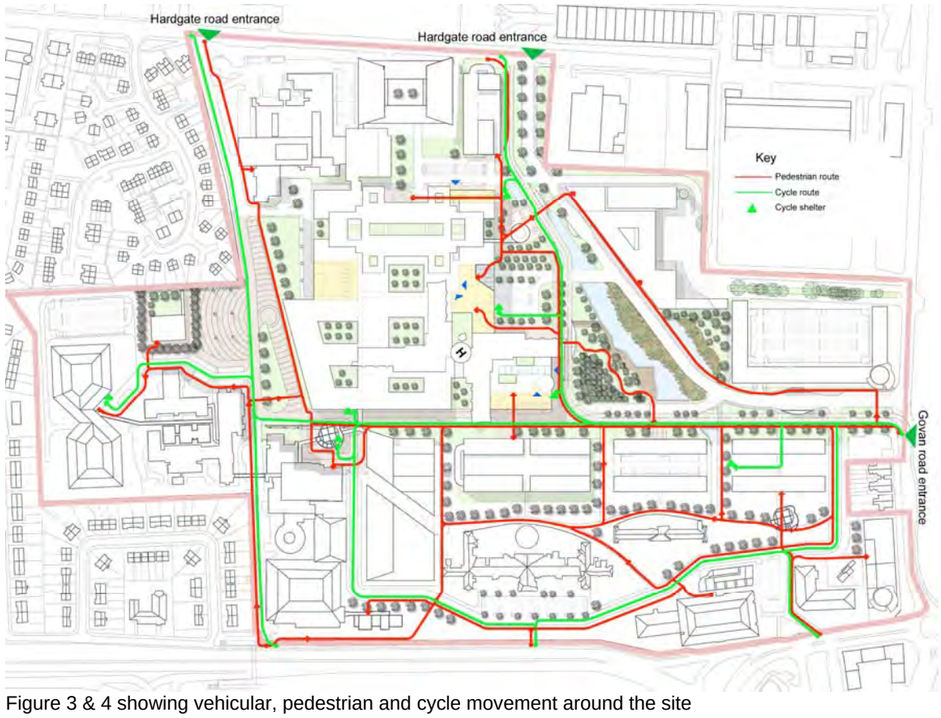

Figure 3 & 4 showing vehicular, pedestrian and cycle movement around the site

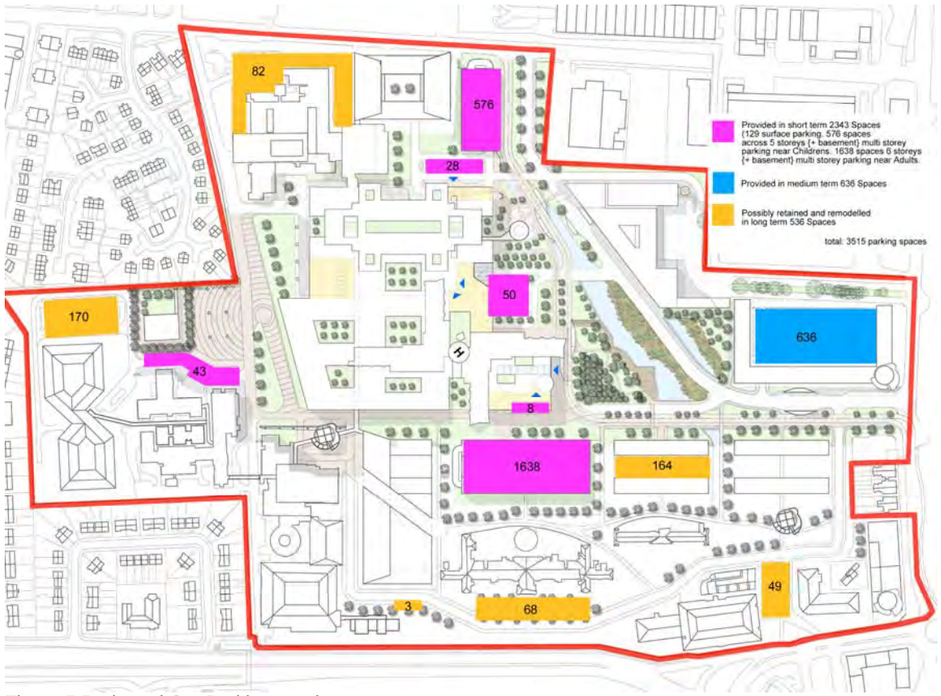

Figure 5 Projected Car Parking numbers

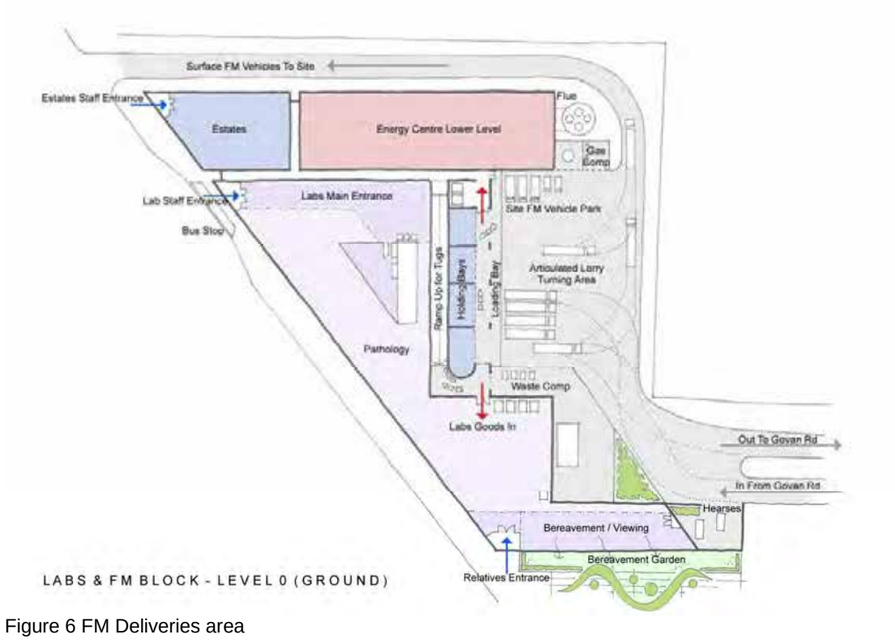

Figure 6 FM Deliveries area

The PSC development strategy recognises that the volume of development on the site lends itself to a more urban approach to place-making with the site arranged into block forms with tree lined routes and spaces between[10]. The new Hospitals in the centre of the site will form the central “armature” around which the Campus Plan can develop as the original buildings are removed and peripheral sites are redeveloped in the future.

Away from the new public open space in front of the new hospitals, other spaces are proposed. These are linked through the network of routes between and through the new buildings. In particular, the PSC proposes the formation of the new Administration and Teaching zone to the east of the new development. The buildings in this area would be developed outside the main project and, along with the retained and refurbished listed buildings, will provide clinical support and teaching accommodation around a discrete landscaped area.

Consideration has also been given at the southern end of the new Hospitals to provide an enhanced landscaped setting for the existing buildings on this part of the site. The Geometry of the new building has been inflected inward to open up views through from Hardgate Road and the existing Maternity building entrance. By setting the edge of the new building back in from the existing road line, the PSC seeks to provide sufficient space to maintain the setting of the buildings at the south end and reduce the impact on the residential properties bordering this edge of the site.

The PSC site strategy has been based on a number of assumptions which require further investigation and clarification in the next stage. Some of these are dependent upon external bodies with which the Board continue to liaise at the time of this report. The key issues that will require further study in stage 2 are:

Planning: The indicative proposals submitted with the OPA broadly follow the PSC contained in this report. Although, these proposals were discussed with Glasgow City Council (GCC) and a number of their consultees in advance of an OPA submission, at the time of this report approval has not been given.

Transport: The Transport Assessment (TA) submitted with the OPA contains detailed proposals for enhanced transport links to the new Hospitals[11]. The site planning strategy has been prepared in tandem with the TA Team and supports the Assessment’s conclusions, including levels of proposed parking provision – see Figure 5.

GCC’s approval for the TA’s proposals is awaited. In particular, the Greater Glasgow Health Board and their technical advisers have promoted routing the new FASTLINK service through the centre of the site in the PSC design to pass just to the north of the new Hospitals’ entrances. Although there is understood to be support for this within the City Council who are co-ordinating FASTLINK, a final decision has not been made.

Helipad: The existing SGH helipad will be lost to provide the site for the two new hospitals. Due to the limited free land available during the build phase, the Board will make off-site provision for helicopters during this period. The Board are exploring possible options for this.

Preliminary studies have then been carried out to test how viable it would be to relocate a new helipad back at ground level on the redeveloped site. Guidance issued suggests that it would be very difficult to achieve this and to maintain compliant approach angles at the recommended orientation. The PSC has therefore adopted a rooftop helipad that is technically capable of handing both Eurocopter and SeaKing/Sikorsky sized craft[12].

Whilst this provides direct internal access via lift to clinical areas (including Children’s Hospital and Neurosciences) without requiring ambulance transfer, the feasibility of this proposal has yet to be fully worked through with the Planning Authorities, Scottish Air Ambulance Service, Civil Aviation Authority, Ministry of Defence and the Emergency Department Clinicians. It is understood that the Board have set up a working group to take this forward.

Tree Protection Orders: Many of the existing trees on the site are covered by Tree Protection Orders (TPO). The PSC assumes that permission can be obtained for removing a small number of these trees in the central site area. The loss of these could be mitigated through an increase in planting in the landscaped areas. This assumption would be subject to a future application for tree removal to GCC.

3.4 Building Organisation

The functionality of the PSC arrangement has been discussed in some depth with clinical users during the Stage 1 design process. In particular the size of the adult acute facilities has lead to the analysis of alternative approaches to clinical organisation to test relationships between different departments and anticipated journey times. The adoption of separate hot and cold routes identified above has been pursued as rigorously as possible throughout the design and extends to the separation of both vertical and horizontal routes at all floor levels. Figure 7 illustrates these routes in axonometric and the adjacency plans [13] indicate how hot, cold and FM (red, blue and green) lifts and corridors extend throughout the building.

3.4.1 Ground Floors Level 0: See Appendix A: 05017-GA-000-A

Both hospitals have their ED Emergency Departments (ED) placed in the centre of the ground floor, coming together at both the public and ambulance entrances. As noted above, the arrangement of the entrances to the ED was the subject of some debate during the option appraisal exercise with different views being expressed as to the most appropriate arrangement.[14] In terms of their operation, the adult and the Children's Emergency Departments operate independently and staff and patients will not mix. The co-location of the ambulance entrances is perceived to be of benefit in a major emergency and also concentrates this activity in one part of the site. The conclusion reached at that time settled on the "separate but together" approach which places them near but slightly separate.

The detail design of the entrances will be a key consideration in any future proposal.

The Assessment Beds which function closely with the ED are also located at ground floor level and are accessed via hot routes for staff and patient transfer. Cold routes to the assessment areas are also provided from the main public circulation so that relatives can reach assessment without going through the Emergency Departments' clinical areas.

Emergency and Outpatient radiology areas are located on the ground floor between the Emergency Departments and the Outpatients' areas. One of the original clinical models proposed placing the adult's and Children's radiology back-to-back in the centre at ground floor level. However, the decision regarding the planning of the two EDs inevitably displaced radiology from the centre and in the intervening period work with to examine the detailed planning has split radiology further onto different floors. In so doing, different modalities can be located adjacent to the clinical departments with which they are most closely associated. The detailed layouts for both Children's and Adult's radiology are described below.

The main public entrances to both hospitals lead into ground floor concourses arranged between their respective outpatient and radiology areas. Opening off these concourses are the reception, café, retail and other public areas associated with the main entrances. The visitor stairs and lifts to wards also accessed from the concourses together with routes to first and second floor outpatient and other day services.

The ground floor plan arrangements for both hospitals place the outpatient service and ED minor areas to the front of the plan off the main public entrances. The rear of the plan is then occupied by the ED major's areas and Assessment Beds. This provides a solution whereby short term self presenting patients penetrate less into the building plan than the more seriously ill.

[13] Appendix A dwgs 05017-GA-000-A to 05017-GA-005.
[14] Refer to separate Avanti Architects Redevelopment Design Options Appraisal Report Nov 2006.

3.4.2 First Floors Level 1: See Appendix A: 05017-GA-001-B

The first floor in both hospitals provides the primary “hot floor” housing theatres, critical care and inpatient radiology areas. As noted above, links are formed at first floor level to Neurosciences and the new Neo Natal Unit being built as part of the Maternity block upgrade. The northern end of the first floor still accommodates some outpatient facilities and the shared Dining area which will be accessible to the public. The public will access these areas from the adult and the Children’s atria. The Dining facility and kitchen will serve both adult’s and Children’s hospitals and therefore it sits between the two to provide dual access. Views from first floor Dining area overlooking the new landscaped space are provided. It is anticipated that the Dining area would be split to avoid members of the public passing between the two hospitals.

Nuclear medicine is another area where a back-to-back service between Adult’s and Children’s is proposed. This is located where it can be accessed from outpatient and inpatient routes through both hospitals without cross-overs.

The adjacency between Paediatric Intensive Care Unit (PICU) and the Neo Natal department has been identified in the brief as important. Although these facilities will be provided in two separate building projects, a link which is as seamless as possible is required. This is discussed further in the detailed layouts below.

Like the horizontal routes, the vertical circulation is separate for inpatients and outpatients. On the inpatient system there are dedicated bed lifts rising up from the inpatient diagnostic and treatment areas housed in the plateau to serve the wards. In addition dedicated emergency lifts are provided to link the ground floor ED to theatre and critical care areas above. Visitor routes from the ground floor concourse to both the wards and the critical care areas are provided without crossing the busy hot routes to theatres and radiology. These cores will not open to a floor they pass through where no public access is required.

Outpatient and other day services on the first and second floors are reached from gallery spaces overlooking the ground floor entrances. This aims to provide both the scale and spatial interest associated with an important public building. Visibility and linkages between floors provide look back to the main entrance to assist with way finding.

3.4.3 Second Floors Level 2: See Appendix A :05017-GA-002-A

At second floor level the two hospitals begin to separate into two distinct masses. The second floor of adults largely duplicates the first floor, although radiology is not present and the detailed internal functions of the critical care and theatre areas differ from Level 1.

At this point it is important to highlight the discussions that have taken place with regard to splitting adult theatres and critical care onto two floors. From the outset the clinical brief assumed the 20 new adult theatres would be split onto two floors: one “clean” and one “dirty”. As with a department like adult radiology which on one floor would be the size of a Premiership Football pitch, it can be argued that the Theatre suite would simply be too large if built in one area and that travel distances within the department from perimeter access points would be overly long.

The Stage 1 adult PSC therefore adopts the two floor split for both theatres and critical care. The detailed layout for adult critical care in section 3.10.3 illustrates the current split. However, during discussion with the users, and in particular Critical Care users, doubts have been raised regarding any split arrangement. Figure 8 shows a possible alternative first and second floor plans that place the whole of critical care on one floor. In the time available for the completion of the stage 1 design it has not been possible to carry out a full consultation on these options to help conclude the debate regarding the pros and cons of a split arrangement. A decision was therefore taken to develop the option shown in 3.10.3 but to include the alternative for further consideration and testing in the next stage. During any future review, users from ED, Theatres, Radiology and Critical Care will have to be brought together to examine the benefits or otherwise of the alternatives. For example, whilst this option would place all of theatres and all of critical care on their own floors, it would dislocate Interventional Radiology from Theatre recovery.

The Children’s second floor plan sees the start of the reduced ward footprint. Children’s cardiology is located at this level immediately above PICU. Users would prefer to see the Cardiology beds located on the first floor beside PICU. However, the PSC reflects a compromise in this respect. Future design development should test if the preferred arrangement can be achieved.

The Schiehallion ward providing Children’s Oncology services is located on the opposite side to the cardiology ward. This provides both day and Inpatient services and can be reached via the separate hot and cold routes. Adjacent to this sits the Aseptic Suite to supply directly into Oncology. Although this service is scheduled within the adult hospital much of the Aseptic Suite’s output will go into Schiehallion making a direct link desirable. Aseptic preparations to the adult hospital will leave via the managed back-of-house FM lifts and travel across to the adult hospital at first floor level avoiding any cross over with public routes.

The Children’s support accommodation at second floor level will serve all inpatient areas, providing family welfare and patient classroom facilities. The remaining area is taken up with plant serving the lower floors and in particular theatre plant sitting directly above the first floor Children’s theatres. The plant room configuration is such that it supports the larger ward footprint on the floor above and removes the need for plant enclosures over the roof areas which cardiology and oncology beds look out on. The PSC proposes planting all these low level roofs with a sedum type green extensive roof with some limited intensive areas to provide outdoor activity space associated with the wards. Planting will extend to both main roofs and plant enclosure roofs to maintain a green outlook when viewed from floors above.

3.4.4 Third Floors: Level 3: See Appendix A :05017-GA-003-A

At third floor level the adult hospital’s general ward footprint starts for two of the wards. The northern most of these would be dermatology which then sits directly above dermatology outpatients on level 2, linking the department.

To the rear of the wards are the extensive enclosed roof plant areas associated with the acute plateau and the base of the wards. It should be noted that the ward plans generally avoid patient rooms looking back at these plant areas.

Level 3 of the Children’s hospital shows the ward floor containing the 96 generic beds. This is discussed in more detail below.

3.4.5 Fourth Floor: Level 4: See Appendix A :05017-GA-004-A

This level sees the start of the full adult ward template containing 4No wards on each floor arranged around the central support area set out in the clinical brief. It should be noted that the two wards at level 3 leave 32 of the 34 wards required to be provided from level 4 up. This allows 8 floors with 4 wards on each floor as drawing 05017-GA-004-A. The detailed adult ward plan is described below.

Level 4 of Children’s is taken up by enclosed roof plant. Again, the PSC proposes that all low level roofs will have a sedum type extensive green finish. This includes the roofing over the children’s roof plant enclosures so that when looking down from the adult wards, the visual impression will be of a combined green roof-scape.

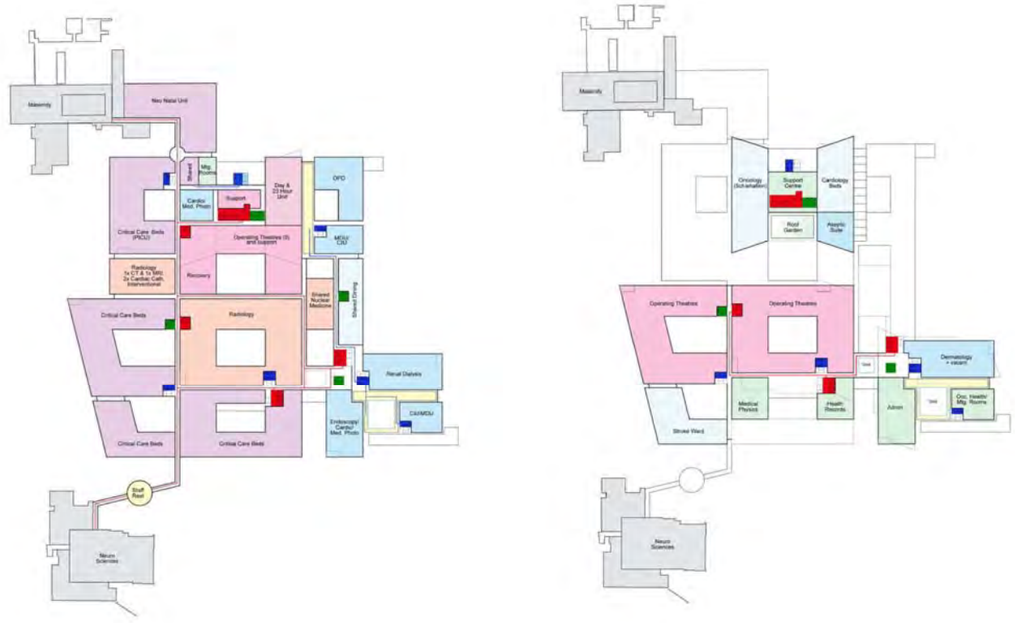

Figure 8. Alternative Option for configuration of Adult Critical Care all on one floor. To be reviewed in next stage with users.

3.4.6 Fifth Floor to Eleventh Floor: Levels 5 to 11

These floors complete the full adult ward template started on Level 4. At this stage wards have not been assigned to particular specialities. The clinical brief has called for standardisation where possible across wards to allow future flexibility. For example, a surgical ward could become a medical ward and vice-versa with minimal modification depending upon future flexing of service need. All wards enjoy the same links to the central core and roughly the same travel times to the acute plateau to provide this flexibility.

3.4.7 Twelfth Floor: Level 12

This floor is occupied by enclosed roof plant associated with the Wards below. In the centre and raised above the surrounding roofs sits the proposed helipad. A short section of ramp leads to two of the bed lifts, taken up to this level to allow direct transfer from the helipad. Two lifts are taken up to provide resilience in the event of a breakdown and would be managed such that when a chopper is coming in one of the lifts would be held at level 12 to provide rapid transit to the acute plateau below.

3.5 Vertical and horizontal Organisation:

The vertical organisation has largely been described above. Figures 7 and 9 show diagrammatically the 3 dimensional stacking arrangements of both hospitals. Analysis was also carried out at an early stage to examine journey times in horizontal and vertical models. This analysis is shown on Figures 10, 11 and 12 comparing the footprint arranged horizontally, double staked and more vertically stacked. What this analysis illustrates is that even if low rise solutions were possible on the site, horizontal journey times would be excessive. The waiting times associated with lifts arise even in a two storey option. The journey time analysis shows that once lifts are introduced, increased vertical travel distance has a negligible impact on overall lift journey times but dramatically reduces the overall travel time between departments when compared to horizontal journeys. The PSC lift strategy has been developed in light of users' valid concerns that lifts can breakdown and cause inconvenience. Lift provision has therefore been calculated on the basis of maintaining a good service even at times when individual lifts are out of action[15]. Further detailed studies of journey times for different options were carried out at the time of the options appraisal.[16]

One of the key concerns identified by the public focus groups was the potential walking distances for visitors and outpatients encountered on the existing SGH site. Long horizontal journey times increase visitor fatigue and downtime for staff. Despite the significant increase in overall accommodation the PSC has endeavoured to mitigate this by concentrating day activity to the front of the plan near the main entrances, close to vehicle drop-off and transport stops. Visitor cores going up to inpatient ward areas open off these concourses and lead directly up to ward entrances on the floors above. Walking distances for visitors on upper floors are therefore very short. The other benefit for elderly and disabled users is in allowing a large part of their journey to be supported by mechanical means (i.e. lift). Voice directions in lifts can then help with way finding for the visually impaired and those with reading difficulties.

Other discussion took place regarding the configuration of the circulation systems. Two different approaches were identified. These were described as the "matrix" and "tree" – see Figure 13. The matrix, such as one might find in the street plan of a town or city, allows multiple connections and adjacencies to be formed. The potential disadvantages of the matrix are that it takes time to become familiar with the pattern and can disorientate new visitors. It is also difficult to control the movement of visitors within the system which can give rise to security problems. Frequent authorised users such as staff learn the matrix plan and quickly develop their knowledge of the shortest routes.

The tree arrangement provides fewer multiple connections but is easier to negotiate and lends itself to a clear way finding strategy and better security. For example this model is used for the management of passenger flows in airports. This structure is therefore better suited to areas of the building that are to be used by outpatients and visitors.

Whereas in a traditional hospital both staff and visitors use the same circulation system, the requirement to separate hot inpatient and cold outpatient areas has provided the opportunity not only to create separate movement systems, but to apply a different spatial structure to each of these. The hot staff and managed inpatient transfer routes form a matrix allowing easy access and freedom of movement from all points in the system to other acute departments. The cold visitor and outpatient routes start from the main entrance and follow the tree, with horizontal and vertical branches to clinics, outpatient imaging and wards. The same route is then retraced ensuring that visitors do not gain free access to other parts of the hospital and leave by the same entrance.

Although the PSC has adopted a vertical ward arrangement for the reasons given, a more horizontal solution should not automatically be discounted. However, an alternative approach would be assessed against the same criteria to test if separation, way finding, security and journey times are equivalent.

Bed lifts are provided to allow flexible movement of inpatients around the building. Bed lifts travelling to all ward floors pass down through the plateau to allow patients to be moved up from ground floor ED and assessment areas. Similarly inpatients can be taken down to level 1 and 2 theatre and radiology areas. Transfer of patients between general wards and ICU, HDU and CCU beds in critical care also follow this route.

Dedicated emergency cores are provided within the plateau to transfer patients between the ED and the theatre and critical care areas. This system is duplicated in the adult and Children's hospitals such that adults and children never meet.

Two of the adult ward bed lifts travel up to the rooftop helipad. As noted above, one of these can be locked off when the helicopter lands to allow rapid transfer from the roof to the hot floor or Ground ED level. Patients can be transferred internally to both new hospitals and the linked Neuroscience and Maternity facilities if required.

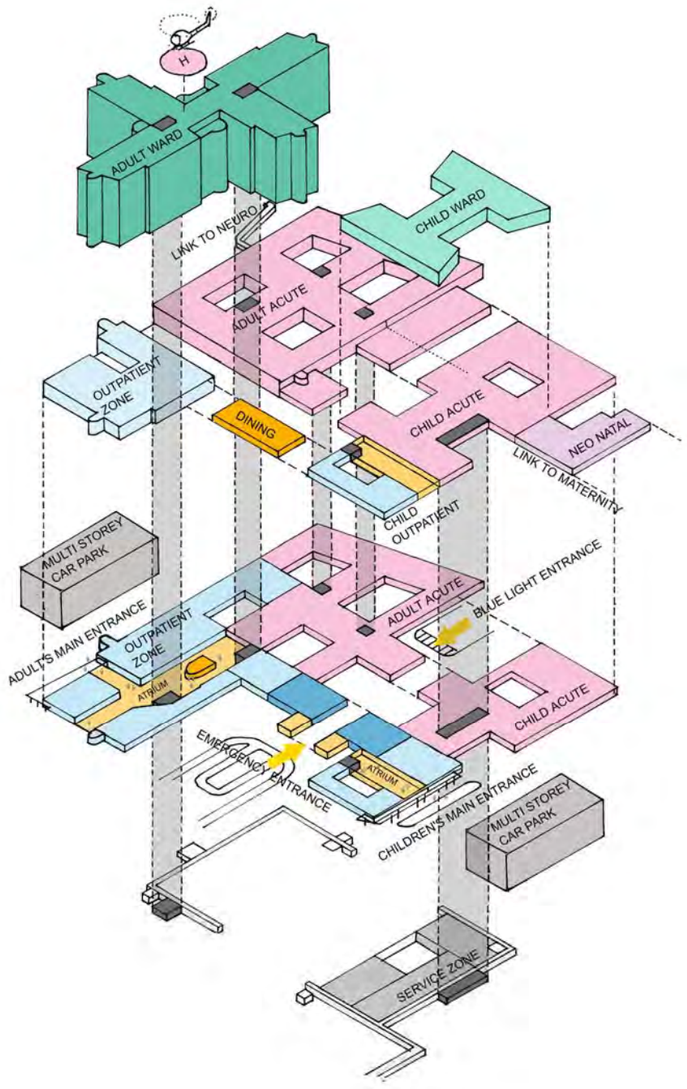

Figure 9. Diagrammatic axonometric showing stacking of both Hospitals.

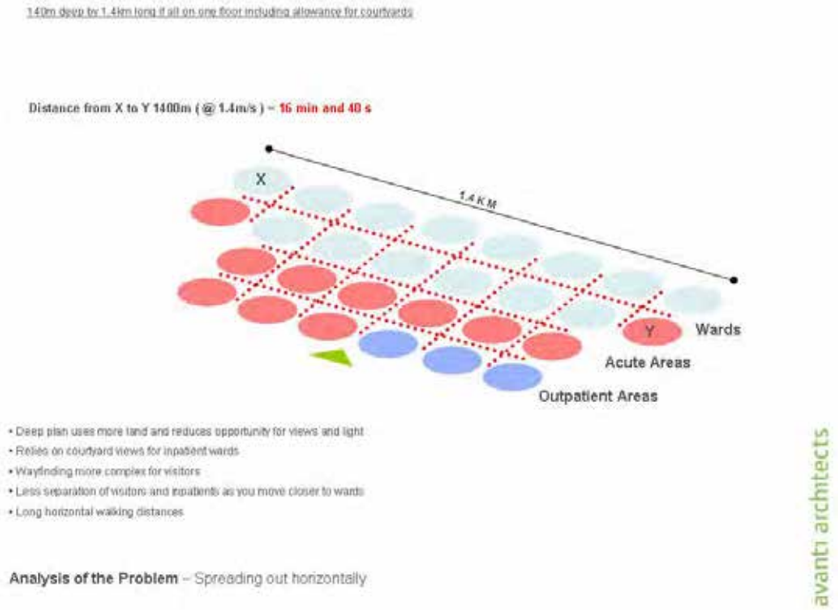
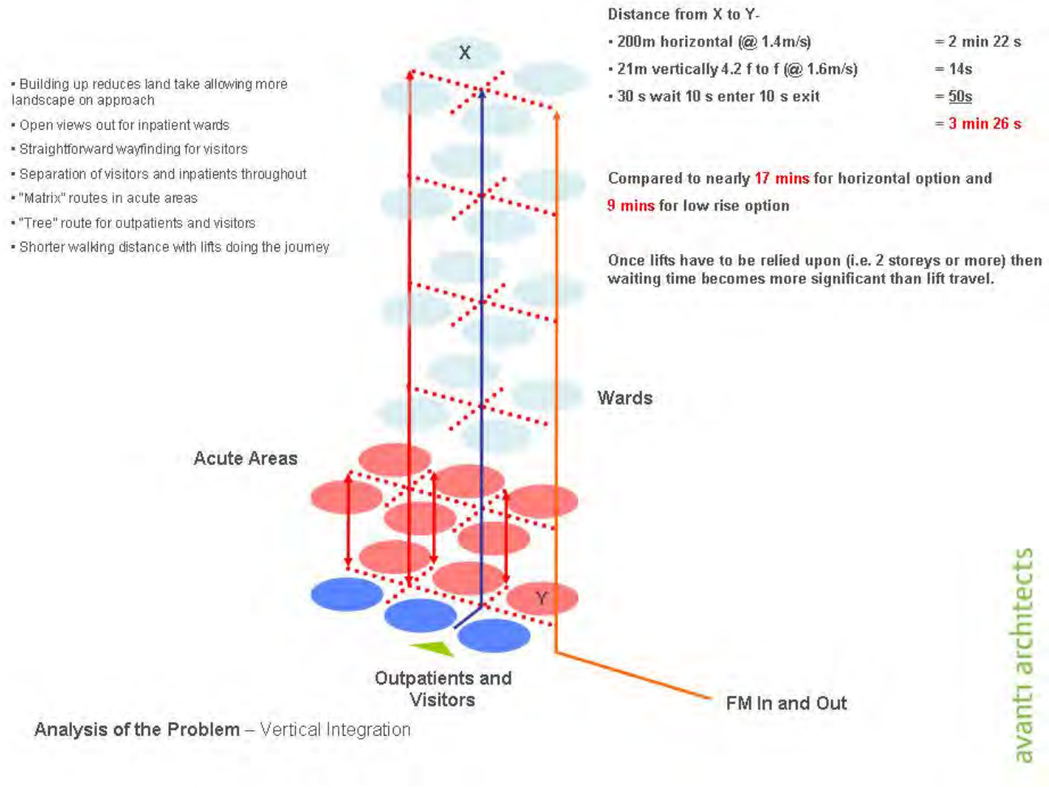
[16] Refer to separate Redevelopment Options Appraisal Report





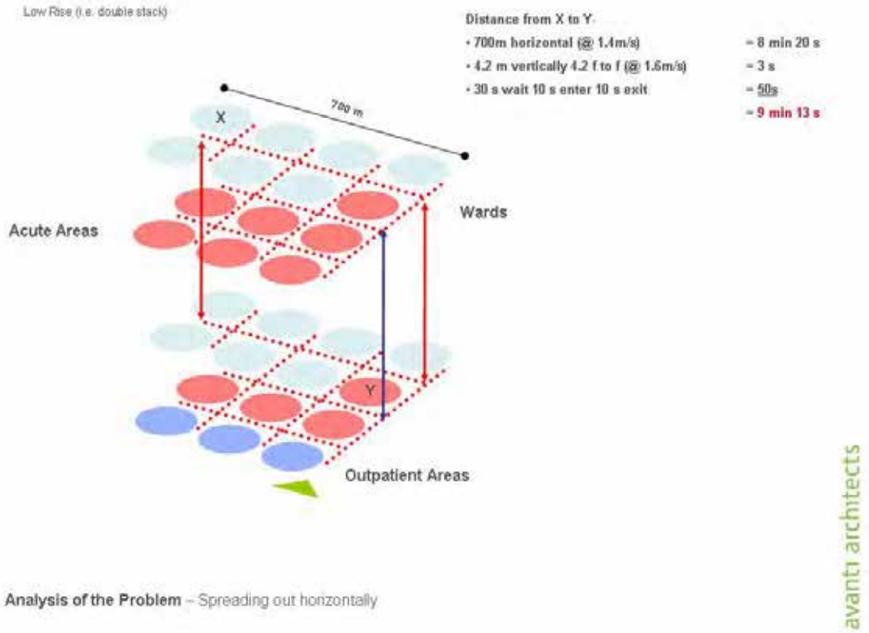


Figure 10, 11 and 12 Stacking diagram options

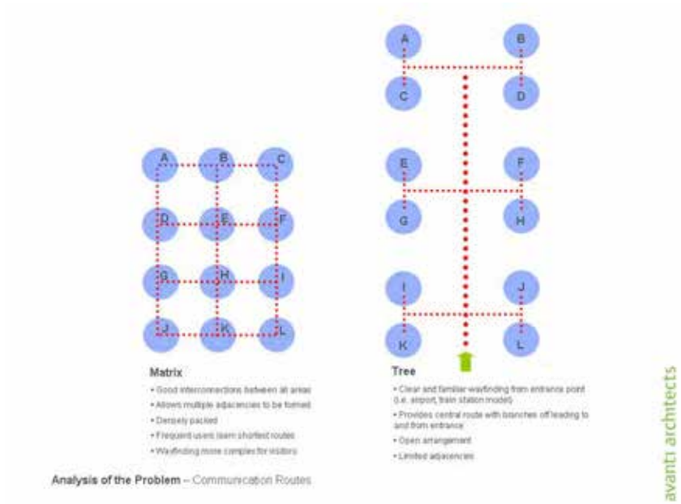

Figure 13 “Matrix and Tree” configurations

3.6 Flexibility and Expansion

The site constraints have a large impact on both the organisation and allowance for future expansion. During the options appraisal studies, users expressed reservations about plans that provided limited hard expansion space. It was also made clear that the “semi-detached” hospitals must be capable of expanding in both directions. Therefore separate expansion land has been allocated for both children and adults.

Figure 14

Figure 14 shows how this hard expansion is achieved. In the case of the Children’s hospital this will involve future relocation of the Ambulance Service Workshops and the building currently leased to the National Radiological Protection Board (NRPB). For the adult hospital expansion if would require the relocation of the mental health facilities that currently occupy this area of the site. Following the demolition of the existing hospital there will be a number of potential development sites within the hospital estate, however the location of most of these will preclude the provision of direct links back to the hospitals. These sites are therefore better suited to non-acute activity whereas the hard expansion zones shown to the east and west of the new buildings provide flexibility in that they can be utilised for both acute and non-acute activities. It is therefore important that in the master plan for the development of the site as a whole, the expansion areas identified are reserved to provide for this flexibility and change.

The clinical brief has allocated much of the administration accommodation to the refurbished listed buildings outside the main new development. This decision was largely driven by considerations of cost, but the location of admin space outside the new build has removed the opportunity to create more soft expansion space within the hospital. Although, departments contain a measure of soft expansion space within their area allocation, the opportunities for soft expansion within the PSC are more limited. However, where opportunities do arise these have been exploited. For example, medical records have been located adjacent to adult theatres on level 2 and immediately above radiology. This soft activity could in the future be moved and the shell refitted to provide say additional interventional radiology with links to radiology, theatres and critical care.

As the design develops further thought should be given to areas that are likely to expand and how planning can accommodate this.

3.7 FM Organisation

As noted above, the FM strategy for the project as a whole requires further testing in the next stage as output specifications are developed. The PSC has adopted the basement distribution strategy which allows goods to be brought across from the FM delivery, holding and distribution areas north of the new buildings. In this location the new laboratories provide both a public face to the new open space while helping to screen the delivery area and energy centre to the rear. The energy centre itself will be double stacked and placed to the rear close to the boundary with the water treatment works. Offices associated with FM activities will sit alongside – see Figures 6 and15.

The long frontage to the delivery yard allows vehicles to deliver into holding areas in advance of goods being moved across using basement link – see Figure 16. The basement distribution system from a separate FM facility is similar to the approach at the new Trondheim Hospital in Norway. The basement loop links into all the FM lift cores allowing vertical distribution up to clinical areas. It is anticipated that lifts would be dedicated for clean and dirty purposes.

The separate basement horizontal distribution system could potentially accommodate a robotic or automated distribution system. Fujitsu are one company investigating these systems. It would be beneficial in the next phase to explore the implications of robotics to ensure that opportunities for future-proofing the building are included.

Because of the cost of creating basement space on a site that has a high water table and poor ground conditions, the temptation to make more use of the basement level has been resisted and the basement is therefore relatively under utilised in the PSC. The use of the basement is therefore an area that may present some flexibility for the development of the FM brief during the development of the design. The other relationship that requires further consideration in the next stage is the link between the basement kitchen and the level 1 servery. The reduced courtyard shown on the plan is also provided in the PSC to allow natural light down to the basement working areas.

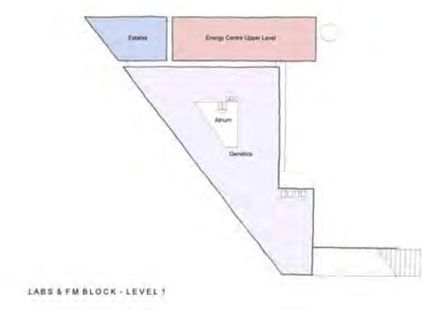

Figure 15 . Labs/FM Level One

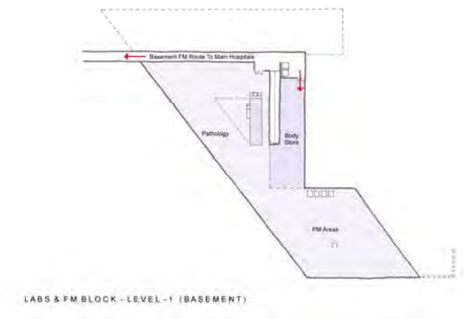

Fig 16. Labs/ FM Basement.

3.8 The Public Realm and Way finding

The PSC recognises that in addition to resolving the clinical brief and the functional challenges of a modern hospital, the building must ensure that members of the public are neither intimidated nor confused when entering the new Hospitals. In the case of the Children’s hospital particular consideration has been given to the need to reassure children and their families at a potentially stressful time.

For example, particular attention has been given in the development of the PSC to the provision of opportunities for day lighting and views as the public routes pass through the building. Further consideration will need to be given to the integration of art into public areas to further enhance the quality and sense of welcome in the two hospitals.

The broad way finding strategy has been outlined above and detailed proposals for the main entrances to both hospitals are described below.

3.9 Security and Control

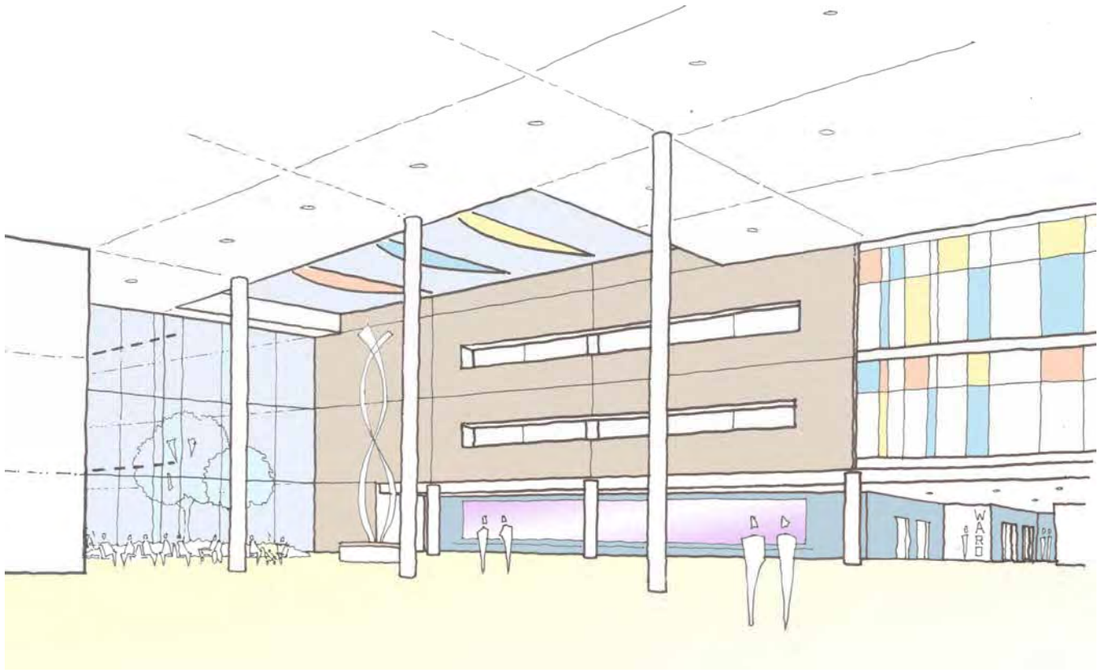
Management of the new development and the safety and security of staff and patients is a key issue for the Board. The PSC sets out to greatly reduce the number of public entrances to the Hospitals compared to the existing SGH site.

The public will enter the hospitals through their separate main entrances, both of which are controlled by main reception, meet and greet points. There are two other public walk in entrances to the separate Emergency Departments. A security base is positioned to overlook these as described in departmental sections below.

The two 24hr entrances will provide controlled access for use by staff and out of hours by relatives called in for an inpatient emergency. In such an arrangement a porters/staff base at the 24hr entrance would control access and allow relatives to be escorted. Patients being transferred or discharged by ambulance will also leave this way.

The existing entrances to Neurosciences and Maternity will be retained but only staff and escorted inpatients will be able to move between these buildings and the new hospitals. The remaining independent buildings on the site including Westmarc, Podiatry etc. will continue to operate as before.

The separate hot and cold, staff and public circulation systems within the new development will significantly improve security in clinical areas and staff safety. Further details on the CCTV and other security installations are described below.



3.10 Key Departmental Layouts

The Board asked their PSC architectural advisors to develop a series of departments at 1:200 scale to test scheduling and planning assumptions. Preliminary Schedules of Accommodation were prepared for each department and meetings were set up to look at the first pass layouts. The comments from those meetings were then incorporated and the layouts amended accordingly. The layouts included in this report illustrate the amended versions. In the next stage, second pass meetings with the user groups will be required to review these alterations. It is likely that further iterations will have to be prepared in stage 2 of the design development before all the users concerns are fully resolved and the plans can finally be signed off.

3.10.1 Adult's Emergency Department: See Appendix A: 05017-GA-ED-001 A

The Adult's Hospital Emergency Department sits in the centre of the ground floor plan. The blue light ambulance entrance at the southern end leads directly to the resus and majors areas. The Public walk in entrance to the north links directly to the main reception and waiting area, which looks into a planted courtyard. A security base is strategically placed to allow access to all ED areas and particularly links to reception and waiting areas. A window from this base overlooking the adult reception is also provided.

From the waiting area patients can be taken to three Minor Injuries assessment and treatment rooms. Minor patients will be treated and discharged from these areas. A route is provided directly from these assessment rooms into the major's areas should this be required. A separate route from waiting to majors is also provided without going through the MIU rooms for those patients assessed as majors who have self presented.

The major's area is located in the centre of the department with bays arranged around a central staff & support base. The resus bays are co located with majors and adjacent to the blue light ambulance entrance. Concern has been expressed that the resus bays are removed from the main public entrance in the event that a self presenting patient requires immediate transfer to resus.

In order to solve this, the PSC provides a route which bypasses minors and majors areas to allow a patient to be moved quickly from the public entrance to resus in such an emergency. The travel time to achieve this is less than 60 seconds which has been deemed acceptable. However, if an arrangement can be developed that maintains the benefits of the current plan but reduces this separation further, this would be preferred. This route also allows relatives or friends arriving in the ambulance to be directed to the main waiting and reception area without passing through the clinical areas.

The Emergency Department has good links with ground floor Radiology as shown. The acute Assessment Beds are co located beside the Emergency Department to enable more joined operation.

3.10.2 Children's Emergency Department: See Appendix A: 05017-GA-ED-002 B

The Children's Hospital Emergency Department also sits in the centre of the ground floor plan. The issue surrounding the relationship of this department with adults has already been discussed above.

The blue light ambulance entrance is at the southern end and the walk in public entrance is at the northern end. A combined Adult and Children's entrance leading to separate waiting areas was considered but rejected at the Option Appraisal stage[17]. The PSC therefore reflects the agreed "separate but together" arrangement. The detailed design of the walk in entrances requires further consideration in the next stage.

The Children's main waiting area is reached from this entrance. The receptions in both the adults and the Children's departments are placed to overlook the entrances, the waiting areas and the controlled link between the two. This has been provide in case a patient enters the wrong department and needs to be moved across quickly between the two receptions.

The clinical areas are zoned into minors, majors and resus. Resus is located near to the ambulance entrance and, as with adults, a direct link is provided from the public entrance. Again if the design could develop to reduce the length of this whilst retaining the benefits of separation, this would be preferred.

Children's Emergency Department is co located with Children's ground floor Radiology and Assessment Beds.

3.10.3 Adult's Critical Care: See Appendix A: 05017-GA-CCU-001-A

The discussion concerning whether or not to split Critical Care across two floors has already been mentioned above. The 1:200 layouts contained in this report reflect the current split option which concentrates all the ICU and HDU beds on level 1 with only CCU (Coronary Care) beds and staff support areas on level 2. The layout arranges the patient rooms in clusters

[17] Refer to separate Avanti Architects Redevelopment Design Options Appraisal Report Nov 2006.

around central staff bases. Visitors arrive from ground floor entrance area via a core which leads into the department past visitor waiting and support areas. Inpatients going to and from the department leave through separate routes.

The layout seeks to position most of the beds with direct access to natural daylight. Evidence exists that ICU departments with good natural lighting promote faster recovery. In developing the design, more consideration must be given to exploring how opportunities for daylight are maximised further. The wider question of whether this department needs to be all on one floor will also require resolution.

Critical Care and Theatres requires direct links with the ED. A dedicated emergency core is provided to link these activities. This core is unencumbered by other inpatient movements. Unlike the main ward bed core, the dedicated emergency core does not extend above plateau level.

Patients being transferred from ICU and HDU beds to general wards would be moved via the main ward bed core.

The ICU and HDU beds are also placed on the level 1 hot floor link. This location provides opportunities for direct links to Neurosciences and Maternity. The PSC recognises the importance of linking the current standalone Maternity into the adult acute hospital. This follows the conclusions of the Northwick Park report. The link provided allows Critical Care Staff to move rapidly to the obstetric areas, in the event that a mother requires urgent care. Once stabilized, the mother can be transferred via the same link back across to an ICU or HDU bed in the acute facility for ongoing care.

3.10.4 Children's Critical Care: See Appendix A: 05017-GA-PICU-001 A

The PSC places Children's Critical care or PICU at first floor level with direct links to Theatres, Radiology (CT) and the ED. The latter would be via the dedicated emergency lift core operating between ground and first floor level.

PICU is situated close to the new Neo Natal Unit in Maternity and further work is required to define the relationship between these areas and the links to other departments, such as Neo Natal surgery to Children's theatres.

Visitors arrive from ground floor public area via a public core which leads to waiting and support areas, managed from the large central staff base.

Bed areas are arranged to ensure most bed positions have natural daylight. 16 of the beds are arranged in groups of 4. This provides the flexibility to operate these as either single rooms or as 4 bed bays. Users supported this flexible approach.

In addition to the central staff base, 2 further staff bases are located within the two main bed clusters. The 6 isolation rooms are separated from the other clusters. The central staff base overlooks the isolation rooms.

Administration accommodation located within the department provides scope for soft expansion, in the event that more bed spaces are required in the future.

Where room areas do not have direct access to an external window, roof lights have been provided.

3.10.5 Adult's Radiology: See Appendix A: 05017-GA-RAD-003A & 004A

This report has already touched on the discussions that have taken place with users to consider how Radiology is configured in the new building. Different models have been tested including models that centralised all of Radiology in one area on the ground floor.

The disadvantage with a centralised solution is that it leads to the separation of the Emergency Departments, the disadvantages of which have been described above. The scale of the new department would also lead to it being potentially unmanageable if constructed in one very large area. The ground floor location would also require inpatients from the wards above to have to travel further to reach Radiology. In particular ICU patients requiring urgent CT would have to be brought down from first floor, rather than easily moved across a corridor.

The result of these discussions is demonstrated in the 1:200 layouts included in this report. Adults is split into two main areas. Outpatient and Emergency Radiology is located on ground floor with Inpatient Radiology on first floor. A third area for Nuclear medicine is also located at first floor level at the front of the plan. It is envisaged that Nuclear Medicine will operate very closely in a back-to-back arrangement with Children's. In this location four separate routes are provided to avoid cross-overs: adult outpatients: adult inpatients: Children's outpatients and Children's inpatients.

Ground Floor Outpatient and Emergency: Radiology in this area is placed to be easily accessible from both sides by outpatients from the public areas and emergency patients from the ED. In the case of the ED very short routes are provided from majors, minors and resus areas. In the event that it is necessary, inpatients can be brought down from the floors above and taken into ground floor radiology without travelling through public areas.

Ground floor radiology in the PSC allows areas to be locked off at night whilst retaining ED access 24hrs a day. X ray and CT are positioned to allow potential future conversion of plain film rooms into more CT rooms. Patients can be taken to the various modalities without passing through other modalities.

The potential disadvantage in this arrangement comes from the limited opportunity for radiology expansion linked to the ground floor department. Being surrounded on all sides also limits availability of windows, although this is mitigated to some extent through the extensive use of roof lights to introduce natural daylight. The main waiting area can be open to the public space. This will provide views across into the adjacent courtyard.

The technical issues related to the positioning of MRI scanners will require much more detailed study. The Board's brief assumes 3 Teslar scanners which impose additional problems in terms of both RF and Magnetic field screening. Although discussions with scanner manufacturers indicate that RF and Gauss line screening can permit a more embedded solution, the impact of large metal objects moving outside the room may be harder to counteract. A full technical study will be required to assess the viability before any design is finalised. The study will also have to assess the best route for magnet replacement. The current PSC assumes that this will either be directly through a demountable section of external wall, or off one of the wider communication routes passing through the building.

First Floor Inpatient Radiology: Radiology in this area is placed to be easily accessible from ICU and HDU beds on the same level. Close links to first floor theatres are provided, including a link between Interventional radiology and shared Theatre recovery as required in the brief.

First floor Radiology is linked to ground floor Radiology via the main stair and lift core sitting on plan between the two areas. Inpatients can be brought in from the main bed lift core and moved to different modalities without passing through other modalities.

First floor Radiology provides greater opportunity for future expansion than the ground floor. Administration areas within the department provide soft expansion space and hard expansion would be possible on the dedicated expansion land to the east by linking across the road at first floor level.

3.10.6 Children's Radiology: See Appendix A: 05017-GA-RAD-001 A & 002 A

Children's Radiology adopts a similar Ground and First floor split to adults, although in the case of Children, the first floor area would also have to accommodate some outpatient activity. It has been established that such patients would have to be escorted from the ground floor public areas to reach the first floor department.

Ground Floor Outpatient and Emergency: As with adults, the area of Children's Radiology sits between the Children's ED and Outpatients and is easily accessed by both. Routes from Children's ED are very short with links from majors, minors and resus areas. Inpatients can also be brought down to this department via the bed lifts, without having to pass through any public areas.

As with adults, this area of radiology is surrounded on all sides which limit expansion and opportunity for daylight. However, the main waiting area is located off the public concourse with views into this space and the café and play garden. This is illustrated by drawings showing the children's public concourse included below.

First Floor Radiology: Radiology in this area is positioned to be close to PICU. Close links to shared Theatre recovery are also available for interventional procedures. Small children often have to be sedated before being scanned increasing the need for induction and recovery areas and potential links to day and 23hr beds.

Discussion with users identified a strong preference to arrange the first floor Radiology around a central control base or bases. Ideally users would wish to see all the control rooms joined together as one but it is likely that technical issues will require some separation. The layout included in this report endeavours to provide this but further technical work is required to examine relationships between specific control areas.

The MRI scanner locations would also have to be subject to the same technical study recommended for adults.

The relationship between Children's and Adult's Radiology was discussed at some length whilst the brief and PSC design was developing. Although both Adult's and Children's hospital are to a very high degree clinically autonomous, the co location on one site of both radiology departments potentially offers some synergies. For example, MRI downtime in Children's during the evening could be taken up by extended adult clinics. Similarly, in the event of equipment failure the opportunity exists to take children across to make use of adult facilities.

The PSC strategy allows this through the connecting back-of-house communication routes. As noted above, these are not public access routes and any patients moved across would be escorted through a managed system. As a result, the building can be managed so that in the event of a patient transfer, children and adults never come into contact with one another, preserving the “separate but together” ethos.

3.10.7 Adults Generic Ward: See Appendix A: 05017-GA-WARDS-002

The preferred option proposes 4 wards on each of the upper floors above plateau level. The clinical brief calls for all four wards at each level to link back into a central shared support core housing seminar rooms, office and FM areas.

Standard ward arrangements in which wards are arranged in a line off a hospital street tend to result in the end wards being separated from the central support area. The alternative arrangement of standard L shaped wards in a doughnut arrangement in which all four link up around the central support area could be viewed as acceptable in a 3 storey low rise scheme. However the large number of adult wards in the proposed new development would create unacceptably high internal courtyards. Moreover, views into enclosed courtyards provide limited stimuli, as opposed to views out across the city.

A pinwheel plan with the four wards arranged equally around the support care appeared to provide a more uniform relationship between the 4 wards and their shared support area. This was therefore developed for the PSC. This pinwheel ward arrangement with the wards’ inpatient rooms arranged along the extended perimeter also affords all the inpatient rooms open views out from the building. The elevated ward location also adds value of this arrangement providing interesting long distance views beyond the immediate site. The presence of such open views from the inpatient rooms mitigates the temporal and spatial dislocation often experienced in hospital where it is easy to lose touch with time and the world outside.

To achieve this plan, a dual corridor has been adopted within each ward. This serves to provide alternative horizontal escape from the far end of the ward – see section 6.1 below. Support areas remaining within the individual wards are located in the centre between the two corridors. Cut-throughs are provided to reduce staff travel distance.

Users were unhappy with plan arrangements that placed the ensuite between the room and the corridor. Layouts that placed the ensuite on the outside wall were also rejected on the basis that they significantly compromised views out and the patient environment. Users preferred the arrangement shown with ensuites between the rooms, despite the fact this further increases demand on perimeter. This was to maximise patient visibility from the corridor while maintaining maximum opportunities for patient views out. The slim plan form incorporating glazing in both external and corridor walls helps improve the working environment in the ward linking corridors and central areas with borrowed light and views out.

It is however noted that circulation must increase above the target figure given in the SoA to support this configuration[18].

Further work needs to be undertaken by users to establish if this is their optimal room / ensuite arrangement and to assess the impact on patient privacy from such an open arrangement. Approval bodies would also have to be satisfied that means of escape requirements are satisfied and fire brigade access can be achieved.

3.10.8 Children’s Generic Ward: See Appendix A: 05017-GA-WARDS-003

Children’s overall bed numbers and their distribution across the building were still under discussion at the point when the PSC layout was produced. The clinical model considering the relationship between 24 bed wards and 8 bed clusters also remained to be developed.

The TA architectural team were therefore asked to look at the generic ward floor that proposed 96 beds arranged into 4 wards, each split into 3 clusters of 8.

The plans developed propose three clusters in each ward, all of which can be accessed without having to pass through an adjacent cluster. The inpatient rooms are arranged around the perimeter and again, like the adult hospital, these rooms have open views out. The end clusters in each ward link up providing the opportunity to operate more flexibly.

The single rooms adopt the arrangements shown in HBN 23 with the ensuites placed between rooms. As with the adult hospital, this provides good visibility from the corridor. This is very important in the Children’s hospital.

Again, this ensuite arrangement and the clustering increase the circulation above the figure given in the target SoA, although it is noted that the target SoA figure is less than the figure in HBN23 for Paediatric Inpatient accommodation.

[18] Refer to HBN 04 Part 1.

The recreation and dining areas sit in the middle of the plan with the potential to access secure outdoor play areas / courtyards. Young Children’s recreational and dining areas are separated from those for adolescents. The need for this was highlighted through the Children’s Hospital patient focus group.

3.10.9 Adult’s Entrance: See Appendix A: 05017-GA-ATR-001

The PSC assumes a larger area for the adult entrance atria than is given in the target SoA. However, the plan shown is consistent with the scale of the new public building it serves and is consistent with the approach adopted by other exemplar hospitals in the UK and abroad. The Board place great emphasis on the public experience of the new hospital and key to this is a generous and welcoming front door.

The Board representatives are enthusiastic about the proposals illustrated in this report and these set a standard for any future design through *inter alia* the incorporation of: interesting volumes: art: natural light: links and orientation with the outside: improved way finding on upper floor areas by virtue of double and triple height spaces linking back to ground floor routes.

The placing of the main retail accommodation at the front door allows this facility to operate on the site outside of the day entrance opening hours. Café and waiting areas link to the entrance concourse at a number of levels to stimulate activity, enhance their outlook and improve way finding. The atria itself will require further consideration when developing the fire strategy.

3.10.10 Children’s Entrance: See Appendix A: 05017-GA-ATR-002 A

The same points relating to the Adult’s entrance also apply with a few additional considerations.

The Children’s entrance concourse is on a smaller scale than that for the Adult’s hospital. The emphasis must be placed on providing an environment suitable for children of all ages. It must be remembered that the New Children’s hospital will deal with very small children up to adolescents.

The PSC allows for the inclusion of internal play areas for small children and suggests opportunities for interactive health displays and internet links for older children. Innovative way finding strategies should also be explored. The PSC suggests the use of “Flybots” moving at high level along prescribed routes to stair cores and waiting areas, leading children and their carers from the entrance.

High quality seating, signage and other fittings must be used to support the high quality environment the PSC proposes.

The Children’s shop would not operate out of normal hours and therefore does not require direct access from outside.

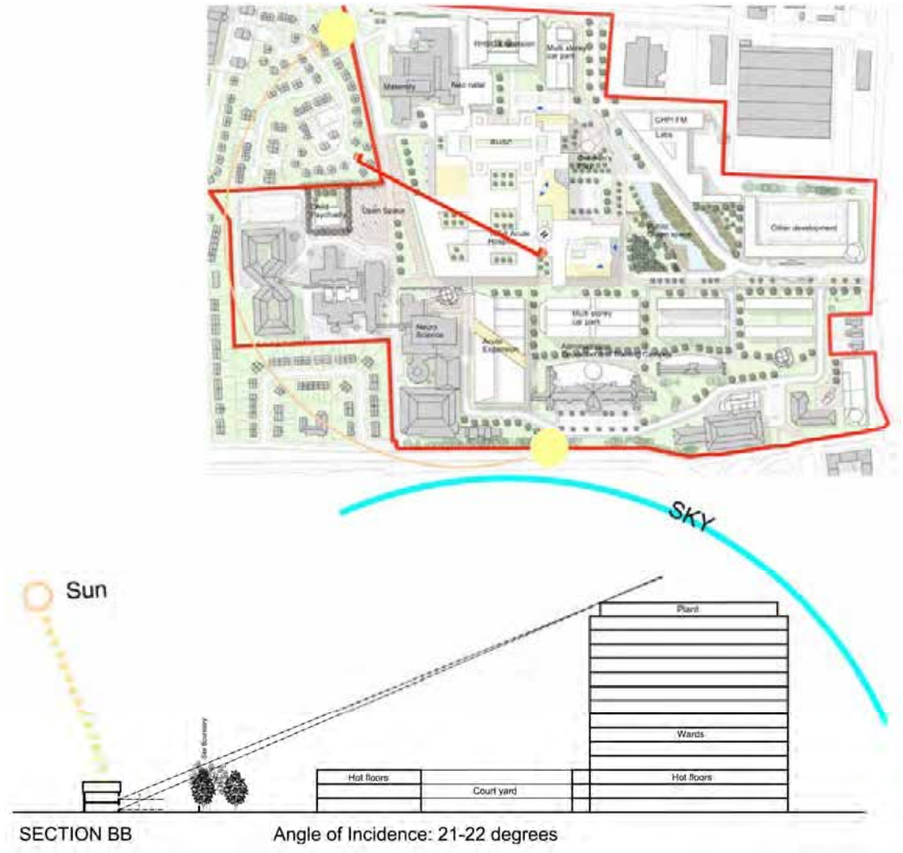


Figure 17. Vertical Sky component analysis.

4.1 Massing and Urban Integration

Studies examining scale and massing were undertaken as alternative options were developed[19]. The Board are sensitive to the presence of neighbouring properties and in particular the impact on the residential communities immediately south of the site. Each option therefore tested the impact on sunlight and daylight and skyline when seen from this edge. Overshadowing will not be an issue as the new main new buildings sit to the north of the residential areas.[20]

In each scenario tested the vertical sky component was found to be below 25 degrees when measured to the nearest point on the face of a residential building. Interestingly, the lower rise options which require accommodation to be more spread out had the effect of raising the southern edge of the new building closer to the residential boundary. They also created a less open and more monolithic skyline when viewed from the south. The current PSC option is illustrated here in Appendix B[21].

The PSC massing approach is therefore to establish a general top edge plateau building line equivalent to 3, 4 and 5 storeys across the site. This line will accommodate the built form of the lower clinical areas of the main hospitals and will be compatible with the existing building lines and new labs block. It also defines the proposed building line on the future development plots and ensures that new buildings forming the admin and training zone are sympathetic in scale with their neighbouring listed buildings.

In the centre of the campus away from the southern boundaries, the new ward elements break though this horizontal building line to provide a more prominent vertical emphasis clearly visible from outside the site. The vertical element sits as a 90 degree fulcrum on the entrance approach off Govan Road and the new entrance off Hardgate Road. This feature would serve as a landmark across the City.

The impact of the new building when viewed behind the two listed buildings was also considered. Even the lower rise options were such that they broke the sky line of the listed buildings when viewed from the Clyde Tunnel Approach. Consideration of this sort of issue is largely subjective but it was felt that a form which clearly differed from the existing site profile could be sustained in this location. The taller ward element was therefore submitted for consideration as part of the OPA.

As part of the Design Statement submitted with the OPA, drawings were provided to illustrate how the Campus Plan and emerging PSC design could form part of a wider master plan for the regeneration of Shieldhall[22]. The design for the new Hospitals must be configured in such a way that allows extension of the master planning strategy beyond the immediate site edge and into the developing area.

4.2 Materials and Elevations

The PSC composition naturally lends itself to different means of articulating the lower horizontal elements and the taller vertical elements. The PSC suggests the use of panels of robust more solid material at the lower levels referenced to the original stone buildings on the site. This could be through the use of elements of stone cladding, or more likely reconstituted or precast elements allowing punched hole windows as well as strips and screens of glazing.

The adult wards would be clad in a high quality curtain walling system made up of clear and opaque glass panels. Glass at this height will not be vulnerable to damage and its inert surface ensures the whole façade can be cleaned easily and will not loose its appearance over time. Windows of clear glazing can be more sensitively integrated into the whole to suppress the repetitive effect of hundreds of individual windows required to let light into each small room. The insulated opaque glass panels can be back sprayed in subtle colour shades such that when viewed as a whole the vertical elements provide both uniformity and variety responding to changes in light throughout the day.

4.3 Landscape Design

In many health buildings, external public spaces are vitally important in that they can also provide the opportunity for positive respite in periods of stress. Sensitive landscaping and well-defined public space in a healthcare environment can provide far more than simply an attractive setting. Through careful design social or intimate, tranquil spaces can be created, providing an environment where people might want to sit or meet, and which further contribute to the healing process.

The relationship between the PSC's built form and open space will be consistent with what one would expect to find in a city. The open space will take the form of small parks, squares and boulevards defined by buildings and routes (i.e. as nearby Elder Park) rather than an open landscape with buildings set in a free space.[23] Spaces between buildings will be designed appropriate to the activity surrounding them. Spaces that form a central public focus for entrances and drop off will be treated differently to those predominantly providing an outlook such as an internal courtyard. The hierarchy of buildings on the site will mean that different scales of building will be required and the space adjoining different buildings will be designed accordingly.

Geometry will be bold and simple and used to provide structure for planting and surfaces appropriate to the activity. There will be a requirement to remove some of the protected trees on the site to ensure effective clinical planning. However, wherever possible existing trees will be retained and new trees will be planted.

When successfully integrated, art can help to create more distinctive and attractive buildings and urban spaces, and enhance the public's experience of an architectural space; therefore opportunities to incorporate public art both inside and outside the building will be explored. Distinctive pieces of sculpture can act as markers on a route assisting way finding and orientation.

The PSC landscape design incorporates a Sustainable Urban Drainage Scheme (SUDS). A network of connecting balancing ponds, rills and swales will provide opportunities for attenuation as well as attractive landscape features. Planting, ponds and other water features will support biodiversity allowing staff, visitors and patients' safe access to green space and contact with nature.

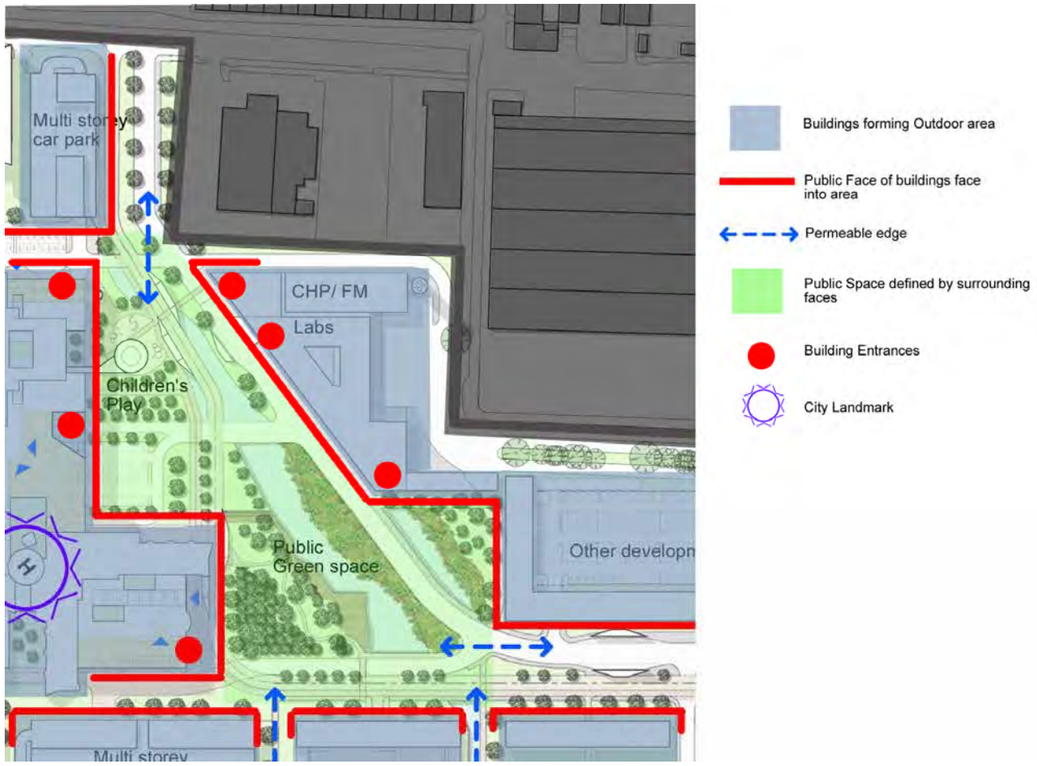

Figure 18. Analysis diagram of urban space

4.4 PSC fit with Outline Planning Application (OPA)

Due to the constraints set by the programme, the OPA was submitted in advance of the completion of the stage 1 PSC.. However, the PSC design was sufficiently advanced for it to accompany the formal OPA to illustrate an Indicative Design for the site.

Although the OPA does not seek approval for a specific design solution, the developing PSC was marked indicative and included in the Design Statement to illustrate one possible approach and to help communicate the size and scale of the redevelopment.

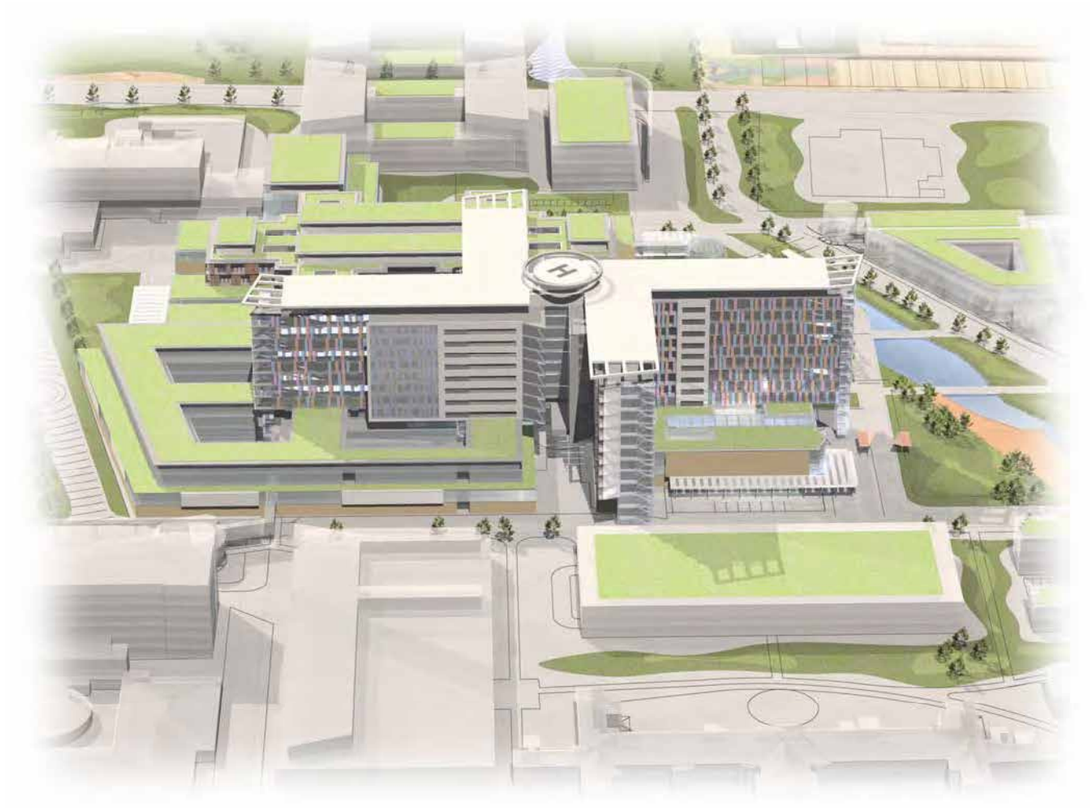
At the point when the OPA was submitted, the PSC assumed a maximum height of 15 storeys above ground. Since then the PSC has reduced to 13 storeys above ground with a further basement floor. It was felt that the OPA should highlight the potential need to increase the general height of building on the site to ensure a flexible planning principle is agreed at the outset.

The current PSC differs from the Indicative OPA scheme in respect of the precise outline of the adult and Children's ward footprints. These were amended during the subsequent 1:200 exercise. However, the differences are considered minor in relation to the level of detail required for approval at OPA stage.

At the time of writing this report the OPA has not been determined. A second design review with Architecture and Design Scotland is also likely to take place. Pre-consultation discussions with GCC indicated that Transport and Accessibility would be the main issues that the OPA had to resolve. Urban Planning issues would also be carefully scrutinised with the New Hospital forming one of the major development milestones along the South Side of the River.

An Environmental Impact Assessment (EIA) was included as part of the OPA submission[24]. The scope of this was agreed with GCC and the EIA set out under the agreed headings. The EIA used the Indicative Design for OPA to assess a number of impacts. It is envisaged that an addendum to the EIA will be required once the final design is established and an application can be submitted for Full Planning Approval. It is likely that a future bidder's design will form the basis of the Full Application.

The EIA will also require a future addendum to incorporate the detailed issues supporting the Lab block Development. Although the OPA identifies this in the April 2007 application, the scope of this was not sufficiently developed at the point of the OPA submission to assess its specific environmental impacts.



[24] Refer to Ironside Farrar's Environmental Impact Assessment April 2007

Section 5 – Design Proposals 3 – The Hospital as a Human Environment

5.1 Character and Innovation

The Board and the City believe the new Hospitals must provide a landmark development that represents the scale and importance of these new public buildings. The Hospitals will be significant additions to the contemporary architecture of Scotland and must meet the aspiration set by the Scottish Parliament to provide the highest design quality in all new public commissions.

The PSC aims to deliver a striking design representing state-of-the-art modern healthcare in clean, high quality external and internal environments. The PSC design aims to provide a piece of high quality urban design that enhances the public realm and that will provide the backbone for longer term development of both the wider SGH site and regeneration of the wider urban area.

The clinical brief is innovative in nature, bringing together many acute specialities to ensure patients receive the right care at the right time from the right experts. The design aims to empower more joined up working across specialities in a design configured to separate flows and provide clarity in planning.

5.2 Patient Comfort

The brief and PSC design provides for a much higher ratio of single ensuite rooms to improve patient choice and quality of care. The design adopts contemporary space standards that ensure wider bed spacing and a maximum of 4 beds in any multiple bay.

The PSC design has adopted enhanced environmental measures to ensure patient and staff access areas are buffered against uncomfortable temperature changes, odour and pollution from outside and unpleasant smells internally. The latest acoustic standards will be employed to control reverberation time and reduce sound transmission to enhance privacy and patient rest.

The PSC has given a great deal of consideration to ensuring patient rooms and other areas have access to natural daylight and where possible views; the adult ward arrangement being an example of this. Further design work should be undertaken to ensure access to daylight is provided wherever possible and desirable.

The adoption of segregated routes and the greater degree of control this offers will improve patient security and safety. The moving of inpatients along routes not open to visitors etc. will also reduce the potential infection control risk and greatly enhance patient dignity.

Retail facilities are provided in safe secure settings at the main entrances. The PSC seeks to reduce the outpatient and visitor journey from the new car parks and public transport stops. All external routes on the site will be well lit and overlooked.

Enhanced visitor parking is provided in the new multi-storey car parks, placed a short distance from building entrances. This ensures more spaces are provided closer to the building entrances.

5.3 Staff Environment

The PSC aims to provide staff with a clean modern and spacious working environment within the limits established by the brief. The separation of routes through the building will help staff move quickly and safely from area to area using managed communication routes closed to the public.

Natural daylight and views out are introduced wherever possible to promote a greater sense of well being and contact with the outside.

The brief has determined that a large part of the staff office and administration accommodation will be provided outside the main new build in either refurbished or new standalone buildings elsewhere on the site. This includes use of the two retained listed buildings. Further work must be undertaken in the next stage to consider users concerns regarding the potential degree of separation. However, at this stage the PSC attempts to suggest how routes to, from and between these buildings can be landscaped attractively.

The concentration of health provision and clinical staff on the site will bring with it enhanced education and training facilities, although these will not form part of main PSC development. The Campus plan has suggested potential sites for these activities which will improve training opportunities for staff and the environment in which they take place.

Good retail and café facilities will be provided and enhanced landscaped areas will improve opportunities for staff rest.

5.4 Public and Private Space

The report has already discussed the separation strategy operating throughout both hospitals. This goes a long way in maintaining the clear distinction between public and private space in the buildings.

Externally, the Adult's and Children's hospitals enjoy separate approaches off the main public space with dedicated parking and drop off close to their respective main entrances.

Emergency entrances are entirely separate from public entrances to reduce anxiety and stress and reduce the risk of accidents. FM coming into the site employs an entirely separate route in off the main road network to ensure the quality of the public realm is maintained. Hearses entering and leaving the site use the same discrete route, again reducing patient stress and avoiding potential distress for visitors.

5.5 Relationship to wider environment

The New Hospitals development will be a significant catalyst in the regeneration of the wider Govan and Shieldhall areas. The developing PSC has been shown to a number of groups including Clyde Waterfront, the strategic partnership of the Scottish Executive, Scottish Enterprise, Glasgow City Council, Renfrewshire Council, West Dumbartonshire Council and Communities Scotland[25]. The proposal to generate a new high quality "Health Quarter" in this part of Glasgow, linked to the other River developments either underway or in planning, has been viewed with great interest.

The Campus Plan and PSC have sought to demonstrate how it would be possible spatially and visually to extend a master planning strategy out from the site to the west and north to meet the river. This includes a proposal to bring the public route along the riverside, inland and through the hospital to bypass the Shieldhall Water Treatment works, which currently sterilises a section of the river frontage – see Figures 19 to 22.

The PSC and the Campus Plan responds to the wider opportunities arising through the potential of FASTLINK and other transport initiatives. The design must continue to develop in a way which makes it possible for these activities to be integrated on site and the ongoing dialogue with the external bodies must continue as proposals develop in more detail.

5.6 Design Quality

The landmark nature of the new development will require that high quality materials be used both on the building and in the landscape. The hospital enjoys a prominent location in the city and will be visible from all sides, including the river and the motorway.

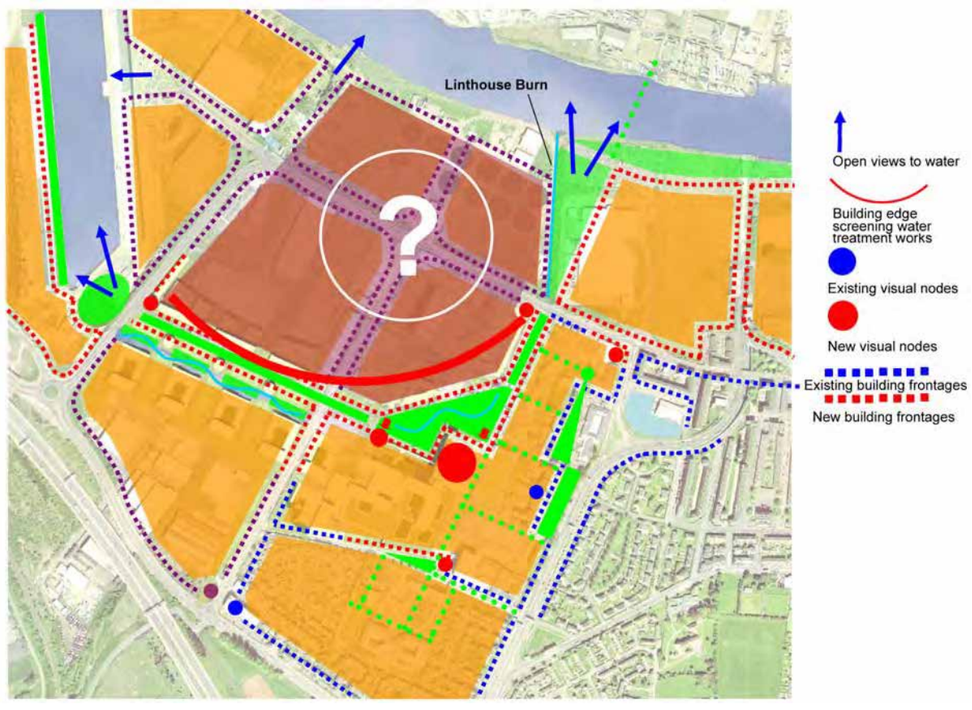
The new green space which forms an integral part of the wider site strategy will incorporate landscape design and materials of the highest quality, with extensive use of semi mature trees in formal areas. Site furniture and artwork will be attractive, imaginative and robust.

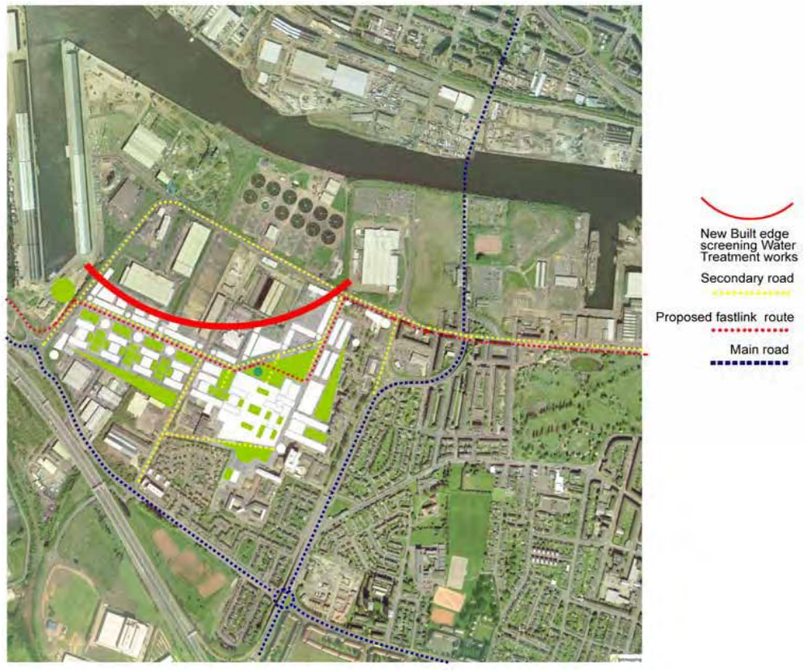
The entrances to the new buildings will be the first experience patients and visitors will have of the new hospitals. The sections above describe the PSC's approach in this respect. The highest civic quality materials will be used in the design and opportunities for incorporation of art will be provided.

Natural daylight and views both out and into landscaped courtyards are provided along public and staff routes to link with the outside and assist with way finding and orientation.

In stage 2 the Output Specifications will be developed to set out in more detail the design quality that must be achieved and the performance standards that must be met.

[25] See www.clydewaterfront.com





Figures 19-22 Possibilities to address the wider environmental context

5.6.1 Daylight and Outlook

Good daylight is commonly considered to be the most important issue in the design of buildings. If occupants can be encouraged to work by daylight with the artificial lights switched off, significant energy and maintenance cost savings can be realised. It is a significant contributor to providing a bright uplifting space for users which leads to greater satisfaction with the building and better user performance and possibly patient recovery.

Most schemes fail to achieve the lights off condition because they rely on vertical glazing on one side of the building. This results in a very bright area near the window and much lower light levels away from the windows. The contrast is uncomfortable with the result that the blinds are lowered and the lights are switched on. Diffuse roof lighting has the ability to provide a more even distribution of daylight resulting in less contrast. This is only really feasible on the top floor or by using light pipes.

Of course not all accommodation needs daylight. Operating theatres, stores, examination rooms etc. generally do not need to be day lit so they can be on a lower floor.

Plant areas do not normally need daylight yet typically require between 5 and 10% of the building floor plan. It is therefore possible to create a great deal of normally day lit space with further accommodation on lower floors which do not normally need daylight.

Daylight (with an overcast sky) normally exceeds 5,000 Lux therefore a daylight factor of 5% will provide at least 250 Lux for most of the year. During about 90% of daylight hours daylight will provide sufficient illumination to satisfy most general admin and ward use (300 Lux).

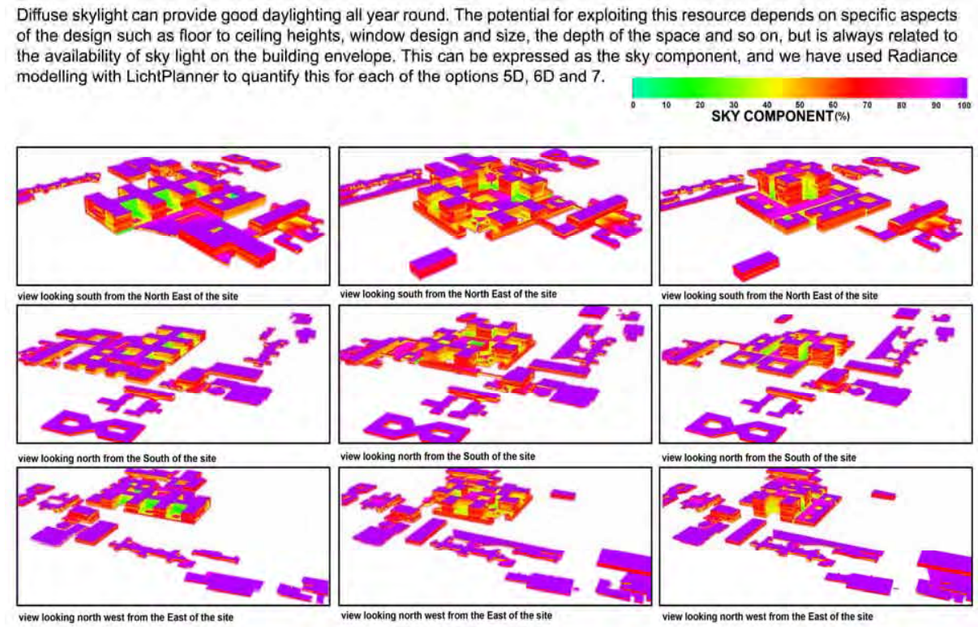


Figure 22 Analysis of the availability of daylight to different areas for differing massing options

5.6.2 Free heating and lighting

An average daylight factor of 5% equates to good day lighting for hospital wards (ref CIBSE lighting codes)

Ensuring shallow window reveals and windows which run close up to the ceiling maximises the benefits of natural light.
Well insulated and leak proof windows allow maximise light penetration and passive solar heating will help meet energy targets.

With helicopter, motorway and construction noise on the NSGH site, the glass must be sufficient thick and well sealed to offer good acoustic insulation. (Rm 30dB +).

Our studies suggest that at least 40% of the wards' external elevations should be glazed and the glazing is more effective located higher in the wall.

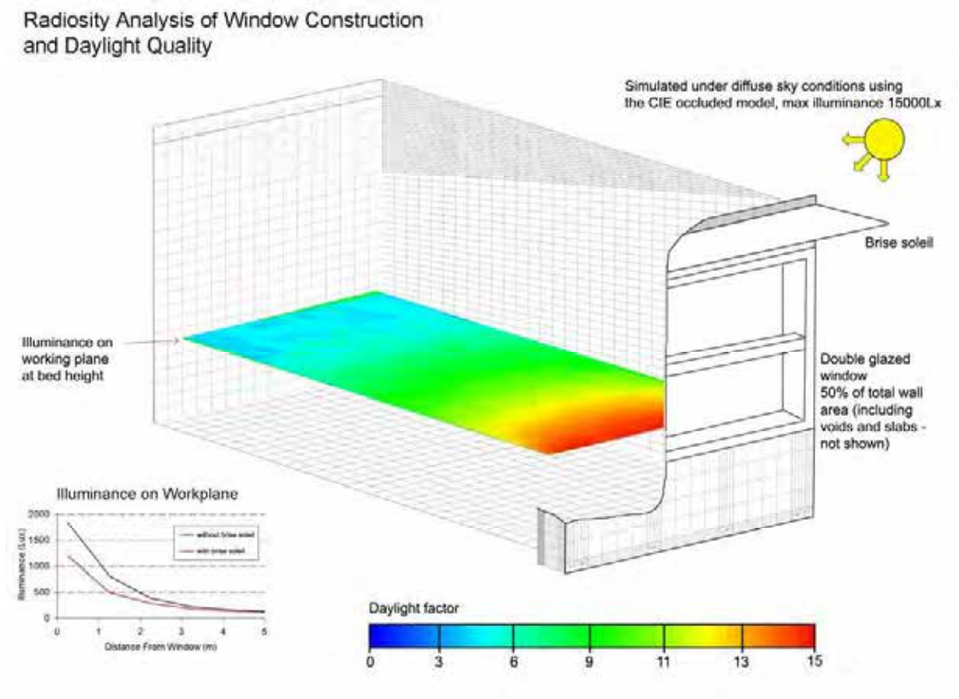

Figure 23 Studies to size window area and geometry

5.6.3 Preventing thermal discomfort and glare

All windows will require devices to control the amount of light entering the room; glare control, protection from the direct sun, dim out for relaxing, black out for sleeping.

In order to meet energy targets the potential for passive solar heating must be maximised whilst minimising fabric losses and leakage.

In the summer wards facing south, south east and south west elevations will require solar control to prevent excessive heat gains.

The method used for solar control will need to be investigated further but could comprise measures such as brises soleil sized to allow winter sun in but prevent high altitude summer sun penetrating the wards or external blinds under user control. The advantage of adaptable solar protection is just that; it can be moved according to season, weather, time of day and need within the space. In summer very good solar heat protection can be provided giving excellent thermal performance/avoidance of overheating, minimisation of any mechanical cooling and good temperature control between spaces. Solar control can be manual or automated.

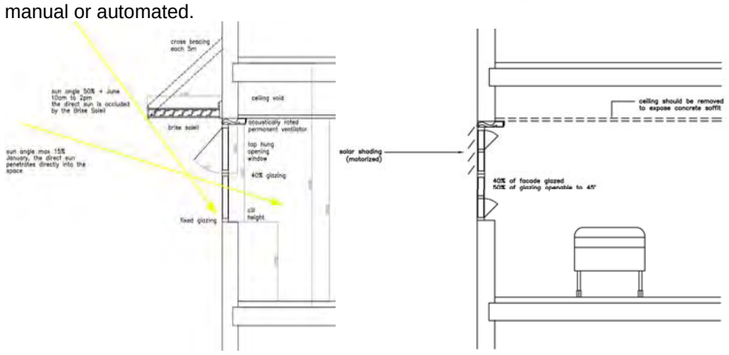

Figure 24 Options for solar control

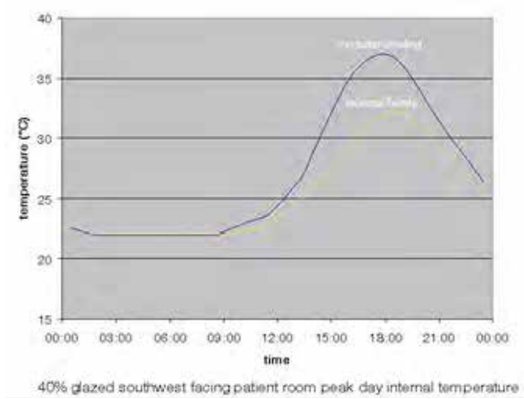

Figure 25 Thermal study of the effect of the external blinds & natural ventilation

The design solution includes motorised external or mid pane solar control blinds with automatic solar gain control and manual override for users. A shading factor better than 0.27 is to be achieved.

5.6.4 Ensuring access to daylight and sunlight for neighbouring properties

The development must not compromise neighbouring properties access to daylight, sunlight and privacy.

The effect of the proposals on daylight and sunlight for the surrounding residential properties can be assessed against the BRE Report; Site Layout Planning for Sunlight and Daylight (1991).

The analysis considers the availability of skylight for the properties to the south west of the site using EcoTect to calculate the Vertical Sky Component and Orientation.

The analysis then considers the availability of sunlight for the properties to the north west of the site using the geometric method from BS8206.

The results before and after the new buildings are contrasted to establish that there is no significant reduction in daylight and sunlight to the surrounding dwellings.

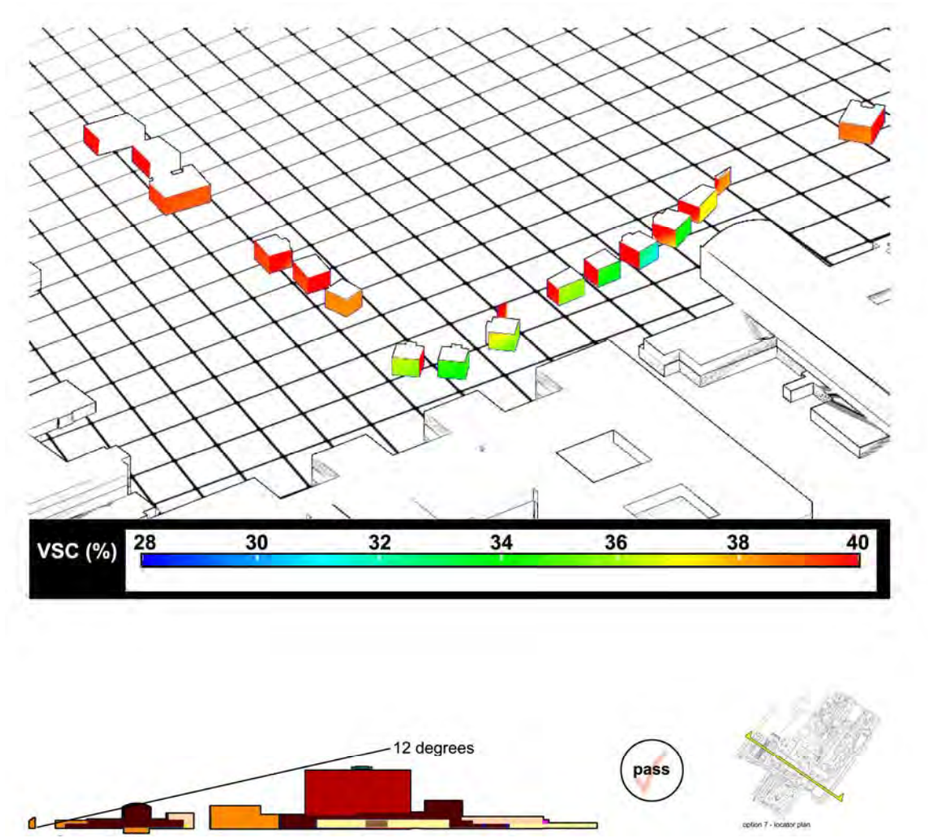

Figure 26 Analysis of affect on neighbours as BRE guidance Orientation

The site, phasing and building planning leads to a building massing solution and proposed orientation.

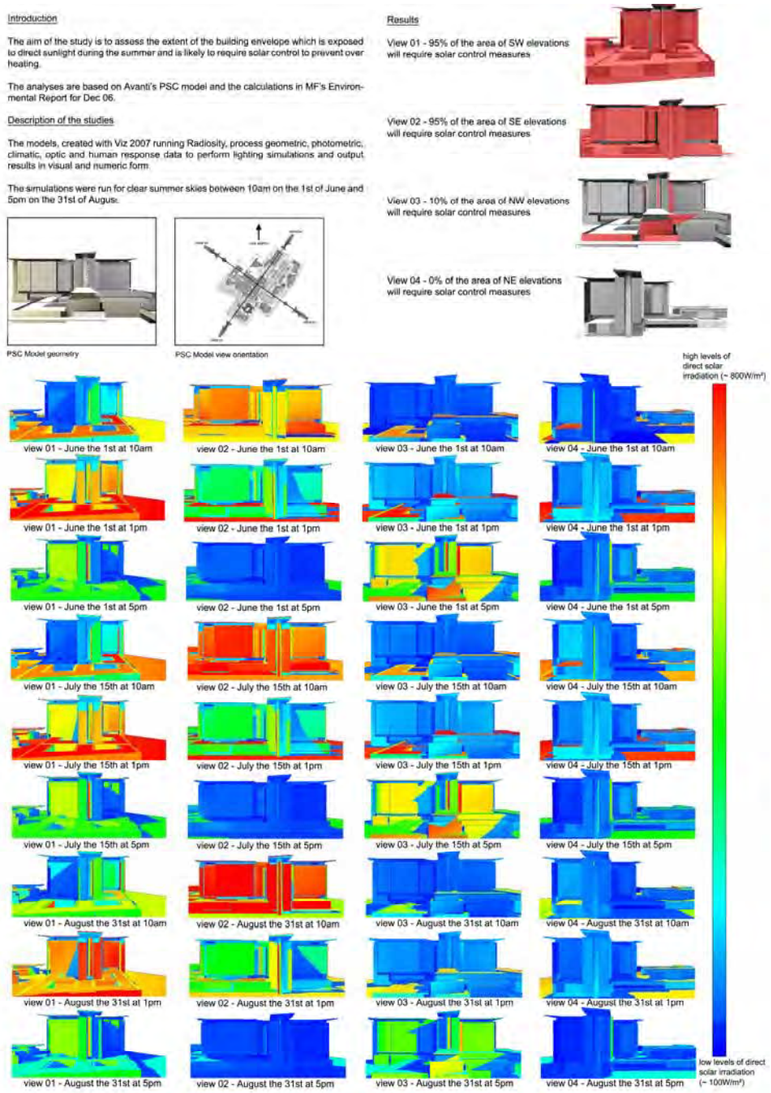

Figure 27 Solar Study

5.6.5 Analysis of extent of shading required

All the facades need good access to daylight and direct sun with adequate glazing areas. The maximum glazing area and solar treatment of the building facades needs to take account of the orientation to provide acceptable summer heat gains.

5.6.6 Air Quality

Shieldhall Waste Water Treatment Works

The works are situated approximately 400 meters from the proposed development (see Figure 28). The works are the largest Waste Water Treatment Works in Scotland, serving 800,000 people (this is very large).

Conversation with Scottish Water have revealed that there are issues with five storm tanks each of which hold 1,000,000 gallons of storm water. In adverse weather, all water and raw sewage is diverted here. It then needs to be processed but the tanks are too large for odour to be contained and a lot of odour is created and released. This generates a large volume of complaints, especially in the summer. They have attempted to empty the tanks at night but are often compelled to empty them more frequently to allow for more storm water.

All normal sewage inlet channels are covered but money for more comprehensive odour control such as containment of the storm water tanks requires significant capital investment. There are plans to upscale a project injecting an enzyme into the sludge which is claimed to dramatically reduce odour. Scottish Water is looking at options for containment on the site or even relocation but there is no certainty with respect to either scope or program for this at present.

HAI-SCRIBE (Healthcare Associated Infection System for Controlling Risk In the Built Environment):
Odour does not present a direct infection risk, but may force windows and ventilation intakes closed, and this in turn may increase the risk of HAI in the healthcare facility. Clinical areas require good rates of ventilation to provide dilution of pathogens generated within the hospital and to control odours within the hospital.

Odour is unpleasant to patients and visitors. Staff are more likely to become tolerant to the smell as they are continuously exposed to it.

The improvement of air quality in healthcare settings is a constituent of modern airborne hygiene procedures. The vast majority of microbes are associated with particles and air filtration is a solution to preventing spread of infection. The air quality requirements in healthcare settings vary from department to department and, often, even from room to room. Some areas require high-efficiency filtration of airborne micro-organisms to protect patients, staff and visitors (e.g. in operation suites, ICUs, TB isolation rooms), whereas other areas require the filtration of gaseous contaminants, chemicals and odours to provide a safer and more pleasant working environment (e.g. in laboratories, autopsy rooms, dental surgeries and pharmacies). It is thus essential that only very-high-quality filters are installed in these environments.

Increasingly stringent national and European environmental legislation on air quality has resulted in the development of new filters to remove and reduce odours and chemical fumes from the workplace. These filters combine a blend of high-grade carbon and alumina/ potassium permanganate that destroys odours, corrosive gases and fumes such as ammonia, arsine, ethylene, formaldehyde, hydrogen sulphide, nitrogen dioxide and oxide and sulphur dioxide as well as contaminants normally treated with standard carbon products. These Air Processors run with near-silent fans, are odour-free in operation and create a healthy and productive environment for everyone's benefit.

An odour problem will be present at times on the proposed site of the New South Glasgow caused by the waste water treatment works at Shieldhall. Odour is best treated at source and measures to control odour at this site could well be implemented by the Scottish Government and Water Authority. If odour control at the hospital is deemed necessary, activated carbon filtration is the most suitable technology both in terms of effectiveness and cost. However, it would rely on a sealed building with a mechanical ventilation system throughout any odour treated areas.

It is proposed that mechanical ventilation systems are fitted with activated carbon filtration to remove odour from ventilation air. The buildings are to be made air tight to reduce the infiltration of untreated air.

Figure 28

5.6.7 Acoustics and Noise

External Strategy: Environmental and Inter-Building noise

General Considerations

The development of the existing hospital site should not have an avoidable adverse effect on the neighbouring noise-sensitive properties (particularly residential). Current planning policy guidance (e.g. PPG24) states that planning authorities should not place unjustifiable obstacles in the way of development. However, they may wish to consider the use of appropriate conditions, insofar as the development of the hospital may adversely affect future residential developments in the area. A normal condition is that the average predicted noise level from the newly-developed site is less than 10dB below the existing background noise levels at the nearest noise-sensitive façade. BS4142:1997 suggests that satisfying this condition will result in complaints being 'unlikely'.

It is recommended that a full environmental noise survey of the existing site and surroundings be undertaken to establish the existing conditions in which local residents live.

Compared to a small domestic development, a large site consisting of a number of buildings renders the term 'environmental noise' ambiguous. The environmental noise impact on the site from adjacent existing and future roads, rail, waterways and aircraft needs careful consideration. However, the impact of one building on another building also needs to be considered, as does the effect of visitors, deliveries, blue light routes and waste collection.

BAA publications and site measurements suggest commercial aircraft noise is not likely to be an issue. However the air ambulance helicopter landing location is likely to have an impact on the site internally and local residents alike. The landing location atop the Adult Hospital renders it relatively unshielded from local residences, except for the effect of the edges of the building itself. Therefore, a barrier at the perimeter of the helipad and roof is proposed to increase the shielding. The helicopter landing pad will be vibration isolated from the roof structure such that the landing impact does not propagate unreasonably into the building.

Testing and Noise Survey

For purposes of break in, suggest $L_{Aeq,30mins}$ at selected locations around the site, deemed to be representative of the local noise environment. It is a very large site and significant variations in noise level are likely to occur, so results would have to be read in this context.

For break out noise implications, we suggest taking two 24 hour surveys $L_{A90,15mins}$ at separate locations on site boundary to establish background noise levels.

Surveys to be conducted in accordance with BS 4142:1997.

Plant Noise Around the Site

- Generators
- Air handling equipment
- Fans, pumps and compressors
- Pipe work around the site
- Specialist medical equipment
- Transformers and switch rooms
- Vacuum pumps in theatres
- Ultrasonic washers
- Kitchen equipment
- Lifts

Internal Strategy: Noise Transfer and Room Noise

Motivation for Consideration
Noise in real-life operating theatres has been recorded (e.g. Boulter 2007) to exceed 70dB $L_{Aeq}$ (well above HTM2045 recommendations). A long session could potentially exceed the action levels of the Noise At Work regulations, and result in long-term effects on the hearing of staff. High noise levels (e.g. from equipment) is reported to be one of the most likely reasons for complaint by hospital staff.

Studies have also suggested that a good acoustic environment could reduce the likelihood of rehospitalisation (particularly of heart patients).
Communication (English as 2nd language, hard-of-hearing, new/complex information to process)

Privacy issues (maternity, consultation etc) are critically important. Protection of personal health information is implicit in the Human Rights Act, suggesting possible legal recourse, although not many precedents yet.

The possibility of Music Therapy?

Establishing Design Parameters

Suitable upper limits for indoor ambient noise levels from HTM2045-2.

Prediction of source noise levels (external and internal) gives structural sound insulation performance parameters. The care taken over the structure needs to be reflected in the details of doors, windows and structural junctions as well as the constructions generally. The requirement for heavy acoustic doors will be balanced with the ability of users (e.g. patients/children) to use them. Services voids can act as useful buffers between floors, in which sound can be absorbed.

High reverberation time adversely affects internal noise levels and speech intelligibility. Reverberation times can be lowered by including acoustic absorption in the spaces, but it is important to establish any areas of concern regarding cleaning of acoustic absorption, as it is usually inherently porous. Many products are cleanable and designed for use in the healthcare industry. Required reverberation times will be taken from BS8233 and HTM2045-2.

Suggested Design Parameters from HTM 2045-2

| AREA | Max unoccupied ambient noise (NR) |
|---|---|
| Lecture theatre | 35 |
| Operating theatre | 35 |
| Private office meeting and consultation room | 35 |
| Multi bed ward, waiting room | 40 |
| General office | 40 |
| Staff room, recreation room, cafeteria | 45 |
| Corridor, laboratory | 50 |
| washroom, toilet, kitchen | 50 |

with mechanical services achieving levels at least 5dB below those specified above.

| Location | Recommended Privacy Factor |
|---|---|
| Maternity, nursery, A&E | 80+ |
| Operating theatre, single bed ward, multi-bed ward private office, meeting and consultation room, lecture theatre | 80 |
| Laboratory, staff room, general office | 75 |
| Waiting room, corridor, wash room, toilet, kitchen, recreation room, cafeteria | 70 |

Reverberation time in critical spaces to be controlled to 0.6-1.0 seconds depending on room volume and activity.

Impact sound between occupied areas $L'_{nT,w}$ not to exceed 60dB on average.

Vibration criteria to be confirmed in relation to BS6472.

See the glossary for an explanation of the terms.

Significant Noise Sources

- A&E and outpatients
- Psychiatric
- Maternity and nurseries
- Boilerhouse/laundry/workshop/goods
- Any areas of construction/demolition around the site – to be managed by Contractor
- Waste disposal
- Drawers closing, footsteps, ring binders, trolleys passing over discontinuities in the floor

- Medical equipment
- Raised vocal levels due to ageing population
- Cardio-training treadmills – impact noise to below

Significant Noise- or Vibration-Sensitive Areas

- Children's
- Maternity
- MRI
- Wards generally for sleeping and recuperating
- Library

Design Considerations for Internal Strategy

Sensitive areas generally will be physically separated as far as possible from noise/vibration producing areas. Either with a physical gap, or a buffer zone e.g. corridor, other circulation area or store.

Noise transfer via corridors will be minimised with absorption and lobby doors. Noise within corridors will be reduced through use of acoustic absorption.

Noise transfer between rooms for privacy means careful planning of doors and windows as they are usually weak links.

Acoustic detailing on joints and penetrations, and cross-talk in ducts will be assessed and controlled.

Impact and airborne noise from kitchen facilities – locate kitchen on level below wards.

Advisable to centralise dishwashing and sterilization facilities for large areas and provide attenuation between them and the wards they serve.

Vibration-isolation of MRI and other super-sensitive equipment e.g. microscopes/labs to manufacturers' specifications.

Audiology (especially vestibular function test facilities) in particular will need to be isolated with care.

Testing: Internal impact and airborne noise levels and transfer measurement tests, plant noise, internal reverberation time, public address intelligibility.

Acoustics in Relation to Environmental Design

Exposing areas of structure with high admittance, as thermal mass, helps to reduce the requirement for mechanical cooling by damping out the peak temperature fluctuations in summer. To work properly the thermal mass needs both line-of-sight into the space for radiant cooling effect, and convective access to the air in the space, for convective cooling effect. There is a potential conflict with acoustic absorption which has poor thermal mass properties and is normally mounted at high level, obscuring the thermally-massive substructure. This can be mitigated in a number of ways, including: mounting the absorption at the perimeter of the ceiling; or high level on the walls; or as baffles suspended from the ceiling to allow a free air path around them; or integrating the absorption with suspended services elements such as light fittings.

The choice of predominantly mechanical ventilation is advantageous acoustically, as it affords better control over openings between inside and outside. For instance sound propagation duct routes can be attenuated with attenuators or duct lining.

Design for good daylight can result in tall spaces (with high windows) to enable daylight to penetrate further into the floor plan. This has the adverse acoustic consequence of increasing the reverberation time, as the volume of the space increases. The advantages of better daylight need to be traded off against the potential requirement for larger areas of acoustic absorption.

GLOSSARY OF ACOUSTIC TERMS

A-WEIGHTED SOUND PRESSURE LEVEL, $L_A$ (DBA)

SPL values are weighted in a way that approximates the frequency response of the human ear and allows sound levels to be expressed as a single figure value.

EQUIVALENT CONTINUOUS A-WEIGHTED SPL, $L_{AEQ,T}$ (DBA)

Energy average of the A-weighted sound pressure level over a time period, T. The level of a notional continuous sound that would deliver the same A-weighted sound energy as the actual fluctuating sound over the course of the defined time period, T.

DAILY PERSONAL NOISE EXPOSURE LEVEL, $L_{DPNE}$ (DB(A))

The measure of sound 'dose' used by the Noise at Work Regulations. The value is the sound energy equivalent a constant value for 8 hours. E.g. 90dB for 8 hours has the same value as 93dB for 4 hours.

SOUND LEVEL DIFFERENCE, D (DB)

The difference in sound pressure level between rooms on either side of a partition. D varies with sound frequency.
$D = L_{P1} – L_{P2}$

WEIGHTED STANDARDIZED LEVEL DIFFERENCE, $D_{NT,W}$ (DB)

A value calculated from the frequency dependent values of the standardized level difference, $D_{nT}$, according to a weighting method described in EN ISO 717-1. This allows the sound level difference of an element to be expressed in terms of a single value.

WEIGHTED SOUND REDUCTION INDEX, $R_W$ (DECIBELS, DB)

A value calculated from the frequency dependent values of the sound reduction index according to a weighting method described in EN ISO 717-1. This allows the sound reduction of an element to be expressed in terms of a single value.

PRIVACY FACTOR, PF (DB)

The sum of the apparent weighted sound reduction index $R'_w$ and the internal ambient noise criterion (usually NR). PF>80 is 'inaudible'; PF<70 is 'clearly audible and intelligible'

IMPACT SOUND PRESSURE LEVEL, $L_I$ (DB)

Average sound pressure level in a specific frequency band in a room below a floor, when it is excited by a standard tapping machine as defined in BS EN ISO 140-6.

WEIGHTED STANDARDIZED IMPACT SPL, $L'_{NT,W}$ (DB)

A single value calculated from the frequency dependent values of the standardized impact sound pressure level, $L'_{nT}$, according to a weighting method described in EN ISO 717-2.

ABSORPTION COEFFICIENT,

The fraction of the incident sound energy that is absorbed on contact with a surface expressed as a fraction between 0 and 1. The higher the value of the absorption coefficient, the more sound that is absorbed by the surface.

REVERBERATION TIME, RT (SECONDS)

The reverberation time of a space is a measure of the rate at which sound decays. It is the time taken for the reverberant sound energy to decay to one millionth of its original intensity (corresponding to a 60dB reduction in the SPL).

5.6.8 Thermal Comfort

General Considerations

High levels of comfort are required for all users; in particular staff and patients. This will have an effect as to how the overall building and the health care provided is perceived, affecting staff performance and patient well being.

Many clinical areas require close control of the room environmental conditions to make the spaces functional. This tends to lead to spaces with air conditioning and/or comfort cooling. Temperature, humidity and air distribution are all carefully controlled and can provide good levels of thermal comfort.

For other areas broader environmental conditions are acceptable and there is the possibility of natural ventilation and mechanical ventilation with or without comfort cooling. To achieve good thermal comfort good zoning, controls, operation and maintenance are essential.

Natural ventilation can provide good thermal comfort throughout the year. For a naturally ventilated space people tend to be more tolerant of high summertime temperatures and their comfort generally. Contact with outside and higher summer air movement improves comfort. The design of ventilation openings is critical. Good solar heat control and exposed thermal mass are pre requisites for natural ventilation to provide satisfactory thermal conditions. Openable windows are often used as part of the natural ventilation strategy, and it is necessary to ensure that other, often contradictory requirements such as restricting openings for safety reasons, are met.

For mechanically ventilated spaces there is less contact with outside and usually little or no direct user control of the summer environment. Often the comfort expectation is raised. The heat gain from fans and duct gain raises the temperature of ventilation air above ambient. In our view for mechanical ventilation systems to internal areas or areas without openable windows peak mechanical comfort cooling is required to provide adequate thermal. Missing a word at the end of the sentence?

HTM(03) places a space temperature limit of >28deg for less than 50 hours in any year as a measure of acceptable thermal comfort.

This type of measure does not recognise the adaptive nature of comfort in relation to the external climate and temperature. In our view, a better measure is of the internal temperature in relation to external air temperature. For naturally ventilated spaces the building should be designed with good solar protection, adequate thermal mass and adequate well designed openings for ventilation such that the mean internal temperature is as close to the mean external temperature as is possible and that the internal peak temperature does not exceed the peak external temperature. If this can be achieved the building will be perceived to have good levels of thermal comfort.

For air conditioned and comfort cooled spaces seasonally adjusted control temperatures should be used. The building should be designed as if it were to be naturally ventilated or so that for perimeter rooms at least it is possible at some future time to successfully naturally ventilate the space Good solar protection and adequate thermal mass reduce the cooling load substantially. The mean summer internal temperature should be at the mean external temperature and the internal peak temperature two or three degrees below the peak external temperature is required for the reasons described above (higher expectation, poor user control) for the building to be perceived to have good levels of thermal comfort.

The summer weather is variable in that some years and hotter than others. During hot years this the HTM(03) limit are difficult and expensive to achieve as they are unrelated to external air temperature. Climate change will make the achievement of these criteria more difficult over the life of the building particularly for natural ventilation solutions. For PFI contractors the HTM(03) limit present an unacceptable technical and commercial risk which leads to a mechanical ventilation solution with comfort cooling in preference to natural ventilation solutions.

5.6.9 Operability

General Considerations

Mechanical and electrical systems shall be automatically controlled. Controls shall be robust, battery backed and distributed as far as is possible so that each system or plant has it's own integral or local controls for resilience.

For clinical areas full system controls and control value presentation will be provided in a secure staff location.

For staff and patient areas, user controls are to be provided to allow trimming of the environmental conditions within the staff/patient space. These include:

temperature adjustment + or _ 3 about set point, return to set point next reset or start point
ventilation rate adjustment low, high, boost, return to set point next reset or start point
light switching and dimming for single room/bed head fittings
window shading and day light control

For patients control will be available from the bed position.

Room/space conditions will be centrally logged on a twenty minute time base to a system database. Real time display, graphing against time, database retrieval, and archiving software will be provided.

A building energy metering, monitoring, reporting and targeting SCADA data collection and management software will be provided for energy management. Metering will be divided according to zone , building function and service, eg lighting and small power will be separately metered; large equipment loads will be separately metered, zone by zone heating and cooling will be metered. This is to allow energy targeting management and monitoring to be carried out on an ongoing continuous basis.

Building Record/As Installed documentation will be centrally help in a digital format arranged, indexed and maintained to be available through a common access portal over the hospital IT infrastructure using standard software.

Operating Plant monitoring, condition management and maintenance software will look at plant and system operation, condition, operating hours and maintenance intervals to determine and program system maintenance requirements. Maintenance shall be automatically planned and logged to form system and individual items, maintenance records include life cycle costs. Maintenance tasks and records shall be communicated with WiFi communication to operator smart PDAs. O&M information shall be linked to Record System & Asset Information so together they provide an integrated and up to date record of the of the system at any time.

Boiler and chiller plant efficiency and heat output will be continuously measured and logged together with key operating parameters to allow optimisation of operation and efficiency.

Energy and space/room efficiency, availability and time within control parameters are to be collated and presented manually as a system report.

All control functions management systems and system data shall be interconnected on an Ethernet backbone and data servers so that it is available across the hospital IP backbone to PC users with correct permissions. Management software will control access, reading and editing rights in addition to recording usage.

Section 6 – Design Proposals 4 – Compliance, Build Quality and Engineering

6.1 Fire Strategy

The complexity and size of the new build is such that a detailed fire strategy will have to be developed. The TA Team have advised the Board to engage the services of a specialist Fire Consultant to comment on the proposals and work with the Team to help develop the design. This will have to be considered during the next stage.

The Stage 1 PSC has made certain assumptions in respect of both means of escape and fire fighting access but these have not been developed or tested and need further development.

As described above the adult ward arrangement adopts the dual corridor solution to provide alternative horizontal escape from the peninsular ward. The ward is then subdivided lengthwise into two long compartments with fire doors across the links. It is envisaged that these doors would be help open during normal operation with the releases linked to the fire alarm. The end stair is accessible from both compartments independently. The arrangement effectively allows continuous horizontal alternative evacuation to an adjacent compartment and from there into a further compartment and so on. The provision of corridor in each compartment would be sufficient to allow the beds from an adjacent compartment to be accommodated.

In the case of the Children's wards alternative routes are provided with wards again divided into compartments and sub-compartments.

Fire brigade access is possible to all four ground floor faces of the building. Fire fighting shafts within the building will be required. It has not been possible to determine whether dual-use lifts would be acceptable or if dedicated Fire Fighting lifts will be required. This will be subject to agreement with the approval body.

The adult ward plan assumes the end stairs are primarily for escape and fire brigade access. A fire fighting lift is indicated at each of these four locations. Given the distance rule from the fire fighting shaft to any point on an upper storey, it is assumed that one of the shafts in the central core will also have to double for fire fighting access.

The size and scale of the development will also require an engineered approach to resolve access to the base of the fire fighting shafts. It has been Avanti's experience on other projects that the distance from the ground floor entry point, to the vertical shaft can be extended subject to the route being fully protected using pressurisation and other enhanced protection. These issues will require further consideration in the next stage. For other M&E installations associated with Fire Strategy see below.

6.2 Structural Strategy

6.2.1 Introduction

In order to develop and provide all necessary supporting information to establish the Outline Business Case (OBC) for the new hospital facility, an overall civil and structural engineering strategy is required to outline the requirements for the detailed design and construction of the new hospital and associated developments for the site. This Design Substantiation Report (DSR) presents and discusses the considered engineering strategies based on the constraints and restrictions of the existing conditions at the site as far as they are known and the information available to date. The information referred to in the following report also provides relevant input of the design aspects for the public sector comparator (PSC).

6.2.2 Geotechnical, Geochemical & Environmental Considerations

Sinclair Knight Merz has reviewed geotechnical information from a number of past site investigations undertaken over the last 30 years, with the intention to assess and summarise any potential geotechnical issues, ground conditions and foundation options that will be relevant to future development proposals for the facility, and in particular the proposal to build a new high rise structure with basements and subway access. The positioning and extent of previous investigations is summarised on drawing EK02355-S-001-P1.

6.2.3 Review of Available Ground Investigation Reports

The site is situated on an alluvial floodplain approximately 500m south of the River Clyde in Glasgow. Of the nine previous ground investigations carried out at the site, approximately a third of the site's area was covered to depths proving the location of bedrock. The ground at the site consists of made ground that is underlain by alluvium, which is in turn underlain by glacial till and Carboniferous Coal Measures bedrock.

The made ground consists of a mixture of cinders, ash, sands and gravels, and brick, and ranges in thickness between 0.3m and 1.75m. The alluvium generally consist of soft to very soft clays and loose to medium dense silts and silty sands, of approximately 20m total thickness, but locally thinning to approximately 16m. The alluvium was generally found to be of high to medium compressibility. In one site investigation report it was noted that differential settlements had adversely affected existing buildings at the site.

The glacial till is described as stiff to very stiff and varies in thickness from less than a metre to approximately 15m, with an "average" thickness of approximately 6m. The upper horizon is often weathered but strength increases with depth. Compressibility of the glacial till was found to be low to very low. Bedrock was found at various depths ranging between 15.5mbgl (metres below ground level) to 25.5mbgl. Bedrock was found to consist of inter-bedded layers of sandstone, siltstone, and mudstone with occasional thin seams of coal. A thin layer of igneous rock was found at one location in association with evidence of a fault zone or discontinuity. The strength of bedrock ranged between very weak (coal), moderately weak (mudstones) to moderately strong and strong (siltstones and sandstones).

From desk-top studies undertaken as part of the previous site investigations, no evidence of shallow mining was recorded in the ground investigations and the Coal Authority confirmed that they have no knowledge of mining activities previously taking place beneath the site. However, two reports confirmed that a mine shaft was marked on historical maps within 70m of the investigated areas, but suggested that the position is not related to the existing hospital site. There is also indication of a trial mine shaft more centrally within the proposed site, but it appears only on early plans and is not referred to elsewhere or known to the Southern General Hospital's Estates Team. Further investigation into the location or existence of historical mine shafts is recommended to be carried out.

Groundwater and perched groundwater exists at the site at depths ranging between approximately 1.0 mbgl to 4.0 mbgl. However, where the drift deposits are relatively impervious, groundwater was not encountered until near-bedrock depths. Water strikes at these depths generally produced sub-artesian groundwater rises of between 6m and 10m.

6.2.4 Geotechnical Considerations

All the previous reports have concluded that the soft alluvium underlying the site has the potential to induce excessive settlements if structures were founded on spread foundations. A range of bearing capacities between 60 to 100kN/m$^2$, depending on drift geology, has been suggested. To reduce settlement some reports have recommended the use of large sized spread foundations and raft foundations for low rise buildings, but it has also been noted that settlements in excess of 25mm would still occur. All the reports concluded that structures with higher loadings, and settlement sensitive structures, should be either founded in the glacial till or socketed within bedrock by using an appropriate system of piled foundations.

The maximum bearing capacity of the bedrock was tentatively specified as 1.0MN/m$^2$ in one report. It is noted that the 1998 Arup report recommended a maximum safe working load of 480kN for 600mm diameter piles founding in 6m of glacial till and a maximum safe working load of 500kN for 220mm diameter mini-piles socketed a minimum of 3m into bedrock.

The majority of the reports recommended the use of bored cast in-situ piles such as the Continuous Flight Auger (CFA) method of emplacement. One report concluded that down-drag of piles would need to be taken into account in the pile design. Vibro-replacement ground treatment of the weak alluvial deposits was discounted due to the presence of cohesive deposits.

For deep excavations, significant basements, or below ground corridors it was generally concluded by most site investigations, that groundwater would likely be an issue but that it could be feasibly controlled by sump pumping and temporary sheet piles.

On the basis of the available information from previous site investigations, it is considered that the whole hospital site is underlain by potentially highly compressible material that would adversely affect structures if founded above or within these compressible deposits. Therefore it is considered that any structures more than two storeys high will require to be founded at either very stiff glacial till or taken down to bedrock level.

The excessive depths to bedrock and the low shear strength of cohesive deposits to significant depth is likely to require building loads to be supported on piled foundations taken down and socketed into the underlying solid deposits. This will require pile lengths in the order of 20m to 25m with adequate socket lengths to provide the required carrying capacity (typically about 3-5m but dependent upon the actual loading).

For the ITN stage and as part of the documentation, a detailed ground investigation will require to be undertaken by GG&CHB Trust to provide a general overview study of the entire site to establish the nature of the ground strata. With respect to the footprint of the proposed building, the location of the offsite mine shaft and the centrally located mine shaft as recorded in historical maps should also be investigated as part of this pre-ITN investigation.

It is expected that further detailed site investigation to suit the outline of the proposed development will be carried out by the preferred bidder prior to financial close.

The site infrastructure will be highly dependent upon any change in topography during earthworks cut-and-fill operations. Should there be any soil retention requirements then the design of such retaining walls and foundations will need great care to guard against sliding in such low strength founding materials.

Given the existing ground conditions, it may be the case that drainage runs need to be laid to steeper gradients than design minima and with regular rocker pipes to enable continued operation should the softer clays settle under the imposed weight of the site infrastructure. This effect will become more prominent if significant areas of the site are raised in level, even by a nominal amount (such as required to provide a piling mat, which in this situation is likely to be thick).

Excavations may be prone to groundwater ingress so consideration to the use of tightly interlocking sheet piles around excavations may be required for any deep excavations, with appropriate allowance for pumping from the base of such excavations.

Where basements are to be formed with service ducts the ground loading will be reduced, which may have a consequential reduction in the heave of the existing cohesive strata. The main issues will be that of water tightness both permanently and during construction. Basements will require to be formed from in-situ reinforced concrete or similar construction with a suitable water-proofing system to retain the external water table under adverse conditions.

6.2.5 Geo-chemical and Environmental Considerations

Minimal ground contamination was encountered in any of the previous site investigations. However, given the existing and previous uses of the site there may well be areas that require any undetected contamination to be addressed. The raised pH levels were established in some areas of the site, but are not such as to require special precautions in normal concrete foundation works, however this needs to be investigated further.

Historically, site investigations were commissioned on a number of occasions and SKM-AH has produced a drawing collating the various site investigations undertaken. This drawing is supported by the interpretative reports produced as part of each investigation. Testing for contaminants was undertaken as part of these investigations and revealed little in the way of contamination at those locations where testing was undertaken. However the locations available for testing were limited by existing services, buildings and other operational areas which necessarily means that large areas of the site have not been tested for contamination. It should also be noted that testing criteria for contamination has become far more stringent over recent years and for that reason the apparent lack of previously identified contamination material should not be assumed to be reflective when benchmarked against current criteria for evaluation.

A number of buildings have been demolished as the site has been developed over the last 100 years. The extent to which the sites were cleared before reconstruction with regard to infilled basements, foundations and the like, is unclear and these locations remain potential sources of contamination and may pollute normal groundwater where this comes into contact with the material.

Likely residual contaminants may include hydro-carbons, asbestos, medical waste or related materials and may be diffuse or in pockets around the site.

We understand that it is GG&CHB's intention to hand the site over to the preferred bidder as a notionally 'clean' site for all development work. It is proposed to achieve this through a series of enabling and remediation works to clear the site and also to relocate active services and discontinue services that are currently on the proposed building footprint. However it should be note that should there be significant contamination found on-site, the majority of which will be below ground and cannot be readily removed/remediated until the sub-structure works are underway. Notwithstanding the above, a comprehensive detailed site investigation with appropriate sampling and geo-chemical testing of the entire site will be required to identify the likely extent of remediation or removal.

6.2.6 Site Conditions on the Existing Hospital

Ground Engineering Characteristics

The engineering characteristics of the superficial deposits to the site are considered to be such as to economically mitigate against their use as founding layers for anything other than low-rise buildings of two storeys or less.

6.2.7 Ground Conditions Risk Summary

The risk register in support of the OBC should include provisions for the following civil engineering and geotechnical risks:

- Poor ground conditions to an average of 20m depth;
- Moderate to severe risk of ground contamination from a variety of sources given the length of time the site has been used as a hospital;
- Presence of groundwater within excavations;
- Contamination in areas of made ground including potential asbestos, hydrocarbons and heavy metals.
- The depth to sound rock-head may be greater than that currently assumed on the available information, and as such the risk register should include an allowance for this.

6.2.8 Roads Infrastructure for Hospital Site

The development of the highway infrastructure is likely to be required under conditions as part of the Planning approval and the Traffic Impact Assessment/Green Travel Plan for the scheme within the context of the wider transportation issues in Glasgow and environs. The extent of new junctions, new site accesses and all road improvement works will need to be progressed as the proposal for the existing site is developed and as planning comments are received.

At present the scheme maintains current accesses from Govan Road and Hardgate Road and details a new blue-light route from the A739 at the southern end of the site. These road junctions will require Highway Authority and Local Authority approval and should meet all statutory requirements.

Further advice and consultation has been provided by Ironside Farrar, WSP and Keppie Planning to gain Outline Planning approval.

Internal site access roads will comply with the appropriate highway standards, supporting the required design traffic flows.

6.2.9 New Buildings

The following text outlines the assumed engineering development strategies for the new hospital buildings and multi story car parks which are to be used in the outline business case and preferred option for the public sector comparator (PSC).

The multi-storey car park options (at two locations), are to meet the anticipated parking demand for the site given its location in relation to the city of Glasgow and notwithstanding the proposals to provide multi-mode transportation options for patients, staff and other site users.

6.2.10 Standards and Regulations

The new development including both hospital buildings and multi story car parks will need to be designed and constructed in accordance with the relevant Design Standards, Building Regulations, Planning Conditions, statutory and local authority standards and to the CDM2007 Regulations.

6.2.11 External Works

The generally flat/gently sloping nature of the site will generate minimal areas of cut and fill across the building footprint. However, construction levels will require to be established at the necessary design levels including basement areas, service and access ramps and to ensure functional tie-ins for connections to existing buildings that re to be retained as part of the new facility. All proposed water features, retention systems and landscaped areas will also require further areas of lower-lying ground to be excavated and profiled.

Excavated material can be retained on site and used for ground profiling / landscaping works provided that any identified contaminated material is either re-mediated or removed. Retained material will also have to be appropriately assessed in terms of engineering properties for the intended end use on site.

It is noted that although much of the site is hard-standing, there may be an opportunity to retain some topsoil stripped from existing landscaped areas within the site. In such circumstances, the topsoil should be assessed and if suitable, stockpiled for reuse.
With regard to Tree protection Orders (TPOs), it is noted that there are some protected trees within the site. These will have to be incorporated into the eventual landscaping strategy and adequately protected to the requirements of a suitable arboriculturalist's requirements during construction works.

Tie-ins for connections to the existing road network, hard-standing areas and other features will require to be fully integrated with the design levels established across the site.

6.2.12 Proposed Hospital Building Foundations

The Master Plan for the new hospital facility consists of a series of ward towers to a maximum of 13 storeys plus the ground floor, podium and roof structure. The foundations for the hospital building are likely to take the form of reinforced concrete pile foundations socketed to a minimum of 3 metres into the sandstone rock head at a depth of 20-25 metres below ground level. Preliminary assessments indicate that foundations bearing in the glacial till at shallower depths would not be suitable, due to the magnitude of the load expected and consequent short and long-term settlements. Settlement for the piled solution should be designed within acceptable limits. It should also be noted that there is likely to be some degree of underground obstructions encountered when placing these piles which are expected to be existing concrete foundations and other historic features.

If bedrock is deeper than that currently assumed from available information, then deeper piles with longer rock sockets may be required beneath the foundations to reach sound bearing bedrock.

Across the footprint of the proposed structure the existing ground is fairly level. Consequently all basement areas will be consistent across the full footprint of the site as required by operational planning criteria. Basements and tunnels will require water-tight retaining walls and to be founded either to bedrock or with a suitable arrangement of raft foundations to prevent differential settlement. These are likely to be formed of in-situ reinforced concrete construction resisting lateral earth, water and imposed loading pressures. Adequate tanking must be provided to below ground structures where permanent or localised water table levels dictate, under the most adverse conditions anticipated.

6.2.13 Proposed Hospital Building Superstructure

The superstructure of the building is the structural frame that will be responsible for the transfer of gravity, imposed and lateral loads to the ground in a manner that ensures vibration (a key issue for hospitals) and noise transfer are kept to minimum levels. Dynamic loads from the helicopter landing pad proposed on the roof of the building will also have to be taken into consideration with regard to vibration assessment.

With regard to services integration it is recognised that hospital structures need to take cognisance of current service requirements as well as some degree of flexibility for future fit outs and refurbishment during the buildings life span. Services routes will run through the hospital on both horizontal and vertical axes and the structural design of the frame should be sensitive to this requirement. Ease of access and routing of services can be achieved for example by the adoption of flat soffit slab methods of construction or open web construction including a range of proprietary systems.

A nominal structural planning grid of 7.8m x 7.8m (maximum) has been developed by the architect for this Design Substantiation Report in support of the OBC and for the PSC. A column grid of this spacing is likely to be achievable using a number of different construction materials and structural systems. This includes structural steel, in-situ concrete and pre-cast concrete solutions. Attention should be paid to the ability of the final design solution adopted such as to ensure that structural stiffness can be achieved and that the structural footprint is sufficiently flexible to allow the hospital to achieve its necessary space planning targets.

The upper floors of the hospital building cruciform tower and parts of the podium have for the purposes of the PSC, have been nominally assumed to be either a slimfloor steel solution or an in-situ reinforced concrete (RC) flat slabs without down-stands. SKM-AH Drawings NE02355-S-201 & NE02355-S-202 show indicatively how the structural make up might be achieved for the hospital building for each respective type of construction. The drawings show typical details and plans for a ward and operating theatre that will allow flexibility with horizontal services distribution and will reduce overall floor construction depths to a reasonable minimum. Structural columns are centred on the grid as referenced above and such as to reflect the geometry of the building and how the structure will transfer the loads to the foundation systems. It should be noted that in the case of the flat slab construction a slightly deeper than normal slab has been assumed at this stage in order to assist with dynamic loading issues. Detailed design assessment may be able to reduce this depth from 350mm to 300mm but this would require careful consideration of bracing locations and circulation shafts.

Although we would not rule out the possibility of using cellform construction and downstand beams we would note that a lighter form of construction than those discussed above would require extreme care in relation to dynamic response and sensitivity issues associated with vibration, particularly on tall buildings.

Ground or basement floors are envisaged as suspended slabs supported from a grillage of beams on the pile caps on socketed piles in sound bedrock.

Lateral stability of the structure could be achieved through a combination of rigid moment frames, bracing bays or the use of reinforced concrete stair and lift cores.

6.2.14 Proposed Hospital Building Fire Resistance

The structure should be designed to achieve the necessary levels of durability and appropriate periods of fire resistance in accordance with all applicable standards, current codes and best practice guidelines. This should take due consideration of the nature of the facility both in terms of the wide range of occupant types and the different physical aspects of the buildings i.e. the tower, podium and Children's facilities.

6.2.15 Proposed Hospital Building Construction Methodology

The new facility will be constructed within an operational hospital and due cognizance of this should be taken in the selection of plant, materials and the construction methodologies adopted. In addition, the new facility will be completed in phases over several years with staggered decants for different patient groups and staff. Due cognizance should be taken of this in the phasing of the construction works, access arrangements, availability of facilities and services and with suitable consideration of the needs of building occupants adjacent to ongoing construction or fit-out activities. Programmed activities should assess and manage all implications of staged completion to mitigate and minimize the affects on all stakeholders at the existing hospital which remains functional until full and complete transfer of facilities.

Both flat slab construction and slimfloor design are widely recognised forms of construction and have been used successfully for buildings of this nature in the UK. The slimfloor solution may have slight benefits in terms of speed of frame construction, but this is often counter balanced by traditional flat slab concrete frame construction that allows follow on trades to work on the lower floors whilst the structure is still being erected.

Tower cranes will be required for the construction of the building and space exists for these to be sited within the constraints of the site. No overhead restrictions are obvious, other than in the use of the existing operational helipad, based upon visual inspection of the site.

Care should be taken during excavation, in particular with reference to localised groundwater inflows, buried services and the temporary stability of excavations.

6.2.16 Proposed Multi-Storey Car Park Foundations

As with the hospital building the foundations for the MSCP building are likely to take the form of a grillage of beams on pile caps on piles socketed into sound bedrock at 20-25metres beneath the site. Findings from the existing site investigation interpretative reports indicate that foundations bearing in the glacial till at shallower depths would not be suitable due to the magnitude of the load expected and consequential long-term settlement. Settlement for the piled solutions should be within acceptable limits. It should be noted that there is also likely to be some degree of underground obstructions encountered when placing these piles which we would expect to be existing concrete foundations or other historic features.

6.2.17 Proposed Multi-Storey Car Park Superstructure

The proposed multi-storey car park structure (MSCP), is likely to consist of a maximum of 4 storeys plus the ground floor level. The superstructure of the building is the structural frame that will be responsible for the transfer of gravity, imposed and lateral loads to the ground.

A structural planning grid of 7.2 x 17.4m (maximum) has been adopted for the MSCP in support of the OBC and PSC. This grid allows 3 standard parking bays between columns and floor plates that clear span the length of 2 parking bays and the main vehicle corridor and the provision of a suitable width, segregated pedestrian walkway.

The construction of multistorey car park structures lends itself to a variety of precast and insitu forms of construction including, precast concrete, insitu concrete, long span cell form beams, etc. The merits of one form over another is expected to be a matter for detailed design resolution, but for the purposes of the PSC has been suggested as a pre-cast concrete floor supported by a structural steel frame.

Ground floors are envisaged as non suspended ground bearing structures of flexible material such as tarmacadam or asphalt. If basement areas are required then the basement floor construction would require to be reinforced concrete suspended slabs on a grillage of beams on pile caps on piles socketed in to sound bedrock.

Lateral stability of the structure could be achieved through rigid moment frames or by the adoption of reinforced concrete stair and lift cores to provide vertical cantilevers resisting the horizontal loadings to the structure or through appropriate vertical bracing.

Movement joints will need to be incorporated in accordance with good practice to effectively accommodate all thermal, differential and moisture movement. Joints should be located such as to avoid critical structural areas of the building as necessary.

6.2.18 Proposed Multi-Storey Car Park Construction Methodology

Construction will be undertaken within an operational hospital and due cognisance should be taken of this in the selection of plant and in the construction methodologies adopted.

The design proposed for the MSCP is typical of buildings currently under construction in the UK. Standard construction methods and techniques can be combined with modern technological developments within the industry to assist in delivering the proposed design solution. The site and adjacent areas potentially provides sufficient areas of storage and, other than the normal applicable statutory obligations, the site has sufficient access for construction deliveries.

Tower cranes will be required for the construction of the building and space exists for these to be sited within the constraints of the site. Other than helicopter access to and from the existing helipad, no overhead restrictions are obvious upon visual inspection of the site.

Care should be taken during excavation, in particular with reference to localised groundwater inflows, buried services and the temporary stability of excavations.

The design should address the exposure of the structure and discharge of surface water from the MSCP in order that future maintenance is minimised.

6.3 Services Strategy

SITE SERVICES & INTERGRATION WITH EXISTING SERVICES STRATERGY

6.3.1 Water

Read in conjunction with drawings 3757/S10P/000-010, inserted in appendices A. These relay the approximate routes of the existing site infrastructure

Mains water is required for domestic water supply and fire fighting.

The existing site water infrastructure is supplied from 5 no metered, mains connections; 2 from the Govan road; 2 from the A739 bypass road and one from Hardgate road. With the exception of the Hardgate road supply the current site infrastructure does allow for these to be cross connected and thus act as alternative supplies. Existing buried distribution pipework is likely to be of a material and age that now requires replacement. The current infrastructure cross connects fire mains with potable water mains.

Prior to the commencement of the PFI construction phase the buildings within the site boundary are to be demolished and existing potable water connections made redundant or removed.

It is currently proposed that the new PFI hospital buildings will be supplied from dual supplies, one from Govan road and the second from Hardgate road. This is subject to confirmation from Scottish Water (see below). These will need to be installed prior to the completion of the Children's hospital and sized to supply the Children's and Adult's hospitals simultaneously.

Following the completion of the PFI construction phase and the occupation of the new adult hospital, the redundant buildings on the site are to be demolished, with their related potable water supplies made redundant or removed.

Scottish Water have been appointed to complete a detailed survey of the existing infrastructure, including a leakage analysis and some flow and pressure tests, these are currently underway. Following this they are to complete a hydraulic model for the existing site and then adapt this to model the proposed site. The conclusion of their works will establish the off site infrastructure implications. This Scottish Water work is programmed to be complete by the end of July 2007.

The site fire mains will be identified as part of the Scottish Water survey works (see above). The new development is proposed to have new dedicated fire mains connections serving the related supplies/outlets. The existing infrastructure is to be rationalised as part of the pre and post PFI construction works, so as to ensure the remainder of the site is adequately served.

6.3.2 Power

Read in conjunction with drawings 3757/HVP/000-010, inserted in appendices A. These relay the approximate cable routes forming the existing site infrastructure

The existing site is fed from two supplies routed from the A739 road into the Pharmacy HV switch room, from where HV cables are routed around the site to more local HV/LV sub stations. A number of the existing supplies are radial feeds.

The existing hospital MV (11kV) electrical services generally emanate from the existing primary MV switchgear. The existing incoming supply capacity is understood to be about 3MVA and currently operates at about 2.6MVA. The local electrcity supply distribution network operator (DNO) – Core Utilities, (Scottish Power), have indicated that this could be increased to a maximum of 5MVA, and that the existing secondary supply could be upgraded to a dedicated, 'firm' supply rated at 5MVA.

Prior to the construction phase of the PFI project, the HV switch room is to be relocated into Pharmacy and a new maternity sub station is to be installed. The infrastructure is to be modified to suit the new HV switch location and the Surgical sub station is to be reefed from the HV circuit that also serves the new maternity sub station. These enabling works allow the buildings on the PFI site to be demolished and disconnected without any disruption to the remaining buildings. The two HV supplies that currently cross the site to the Surgical sub station become redundant and can be removed.

The new hospital buildings are of greater area and serving a greater number of patients with greater intensity/scope of service. The site requirement for power will be substantially increased and the electrical supply capacity and robustness will need to be increased.

We are currently working with Scottish Power to determine the options to increase the site electrical supply. Substantial offsite works will be required and is likely to require an on site Medium Voltage 33kV substation to be established off or on the site. The Scottish Power requirements/proposal is likely to affect the incoming HV arrangement and switch room described above.

Incoming MV Electrical Supply

A reminder of the electrical loads for the development:

- Total site load after site diversity = 15 MVA with redevelopment and "growth factor"
- RHSC = 2.5 MVA
- AAH = 6.5 MVA
- Total PFI load after building diversity with expansion and "growth factor" = 11MVA

The combined Assumed Maximum Demand for the new hospitals as initially built and currently briefed is estimated to be approximately 8.7MVA. Assuming expansion as planned for and a growth factor of approximately 20% in line with HTM-06-01, the Assumed Maximum Demand will be taken to be 11MVA. All 11kV switchgear, cable distribution and standby generation capacity should be sized on this basis.

Dual incomers from DNO rated at 15MVA at 33kV :

The design of the incoming service from the distribution network operator (DNO), and associated 11kV distribution point, has been designed to offer both resilience and flexibility of operation. Maintenance and future replacement of equipment will be possible with little or no disruption to supplies.

Negotiations with the local DNO, Core Utilities (Scottish Power), have suggested that a primary transformer substation will be required to serve the whole South Glasgow Hospital site with separate incoming MV supplies at 33kV both originating from Braehead.

Ideally, dual supplies should originate, if possible, from separate DNO substations, ideally from separate parts of the National Grid with independent cable routes to the hospital site. Where separate MV supplies from separate substations are not available, additional standby generation resilience may be necessary to improve overall resilience.

Primary Transformer Substation

The HV network is supplied from the EHV network at Primary Substations utilising transformers of standard size and phase connection. Typically, twin 12/24MVA (or 20/40MVA) 33/11kV primary transformers feed a two section 11kV busbar. The transformers are to be oil filled and naturally ventilated.

Each incoming feeder is to be connected to a different busbar section. The incoming circuits operate in parallel with the bus section circuit-breaker normally closed. The plan area required will be approximately 18m x 30m (see drawing SK-008).

The DNO has suggested that the options for the establishment of a 33kV/11kV primary substation are:

1) New DNO primary substation on the site supplied, installed and operated by Scottish Power, with the client contributing to development costs.

2) New private primary substation on the site supplied, installed and operated by the client with Scottish Power supplying electricity at 33kV.

Option (1) is preferred and negotiations with Core Utilities (Scottish Power) are underway at this time to attempt to achieve this.

Metering breakers are to be located either side of a bus section switch. This arrangement will allow the PFI development and existing site to be metered separately and for the DNO to maintain their equipment without disruption to supplies.

The establishment of a primary substation, by the local DNO, with a robust incoming supply at 33kV and delivering power to the site at 11kV has the contractual advantage that the existing site distribution can be kept separate from the MV distribution required as part of the proposed PFI development.
For the new PFI hospitals new utility electrical supplies and on site HV infrastructure will be provided. The drawings show new dual supplies coming into a new HV switch room in the energy centre, these are currently shown to serve the PFI site only. The source location of these is subject to the final proposal/agreement of Scottish Power. From the HV switch room the supplies are to feed local transformers positioned on two independent HV rings circling the new hospitals.

Electrical supplies to the PFI hospitals will be backed by on site standby generation.

Following the completion of the PFI construction phase the HV supply to the retained estate can be extended from the Surgical substation back to the new incoming HV switch room so as to provide a ring. Once the adult hospital is occupied a proportion of the retained estate becomes redundant, a new substation is to be installed to serve the remaining listed buildings (effectively replace the existing CMB substation that will be demolished). The existing supplies are to be reefed or made redundant as the related buildings are demolished

6.3.3 Fuel Natural Gas

Read in conjunction with drawings 3757/S32P/000-010, inserted in appendices A. These relay the approximate routes of the existing gas infrastructure

Natural Gas is required for space and water heating, some steam supply for humidification and potentially combined heat and power supply.

The existing site gas infrastructure is supplied from 9 no metered, mains connections; 5 from the Govan road; 2 from the A739 and 2 from Hardgate road. Existing supplies are all radial supplies and the buried distribution pipework is likely to be of a material and age that now requires replacement.

Prior to the commencement of the PFI construction phase a new boiler house is being constructed and the existing catering facility is to be moved off site. This allows for the existing boiler house to be decommissioned and the buildings within the PFI site boundary to be demolished with their existing gas supplies made redundant/removed.

It is currently proposed that the new PFI hospital buildings will be supplied from a new mains connection from Govan road. SGN have confirmed a budget price to provide this, we also understand this confirms that they have reviewed the additional load in relation to their infrastructure and have allowed for any necessary modification works within this budget price. This mains will be routed into the energy centre to feed the new heating and CHP plant (for both Children's and Adult's hospitals) and will then be routed via the underground tunnel to serve any local supplies e.g. auotclaves, humidifiers etc.

Following the completion of the PFI construction phase and the occupation of the new adult hospital, the redundant buildings on the site are to be demolished, with their related gas supplies made redundant and removed

6.3.4 Drainage (foul & surface)

Existing Drainage Networks/Strategies

The existing on-site drainage comprises of both stormwater and combined (foul) systems running generally north towards the entrance to the site to Govan Road. Both of these main drainage networks are not adopted by ScottishWater and are the responsibility of GG&CHB. Please refer to NE02355-C-800-P1 for indicative layouts.

There are a number of connections into these systems from outwith the site which contribute unknown quantities and flowrates of both foul and surface water into these systems. These connections are from the housing at the south of the site, the fast-food Dining area at Moss road and Hardgate road to the west of the site.

Existing Combined (foul) Drainage

The existing main combined (foul) drainage runs generally north-east across the Southern General site. The main pipe comprises of a 375dia vitrified clay pipe which outfalls from the site at Govan road before entering the adjacent Shieldhall treatment works. Connections of both foul and surface water enter this pipe from developments across the existing site with many (?)being required to be maintained for future use. (Missing a word?)

Existing Stormwater Drainage

The existing main stormwater drainage comprises of a 600dia pipe to the south of Langlands Drive and a 1200 x 950 brickwork egg pipe continuing from Langlands drive to the hospital perimeter. This network follows the same general route of the main combined (foul) pipe, running south to north before discharging at the adjacent to the Govan road entrance into an open channel and subsequently into the River Clyde. An existing 600dia stormwater pipe from Hardgate road forms a major branch in the stormwater network running east-west across the site.

Phase 1 Drainage Enabling Works

In order to ensure the continued operation of the existing drainage networks during the Phase 1 development works some drainage diversions are required. There are four drainage runs through the proposed site which must be maintained:

Obstetrics/Gynaecology – 150dia stormwater pipe

This pipe runs west to east and connects into the stormwater network running through the proposed Phase 1 development site. Due to lack of levels information it is not possible to definitively propose the route for this diversion. There are two options available which could ensure the satisfactory diversion of this pipe:

-Connection into an existing 225dia pipe to the south of the Maternity wards

-Diversion to the north-east across the boundary of the proposed Phase 1 development with connection into the existing 600dia pipe running from Hardgate road.

Main combined (foul) pipe - 375dia vitrified clay pipe

The diversion of this pipe is required from an existing manhole in Langlands road to the south and around the proposed facility. This will take the form of a 375dia concrete pipe with new manholes at changes of direction, connections to existing branch lines and provision for connections from the proposed facility. The layout of these proposed diversion works is shown indicatively on NE02355-C-801-P1.

Following these works the existing pipe will remain in its present configuration running west to east along the hospital access road before outfalling into the ScottishWater sewer in Govan road. Capacity assessments are currently being carried out by ScottishWater for the Shieldhall treatment works and the existing outfall will be re-used for all foul loadings from the new development and during the phased decent of facilities and personnel within the Southern General site.

Main stormwater pipe - 1200 x 950 brickwork egg pipe

As for the above combined (foul) drainage pipe diversion, the main stormwater run must also be diverted to avoid the south-east corner of the proposed new facility. The route of this diversion will typically follow the combined (foul) diversion along the existing and proposed site roads as shown indicatively on NE02355-C-801-P1. A 1200dia concrete pipe is to be used in order to match the existing capacity of the 1200 x 950 brickwork egg pipe.

Hardgate road – 600dia stormwater pipe

The diversion of this pipe is required around the northern edge of the proposed facility. Only minor diversion works involving two manholes and new 600dia concrete pipe is envisaged. Care must be taken during demolition works at the existing helipad to ensure the existing pipe is not damaged.

The diversion works for these drainage runs should also include the provision for new connection points from the proposed development works as appropriate. These are discussed further at the end of this section.

Proposed Storm and Foul Water Schemes/Strategies

The below ground drainage philosophy has been discussed with the local service provider, ScottishWater. The following section of this DSR outlines their anticipated key requirements and restrictions in order to comply with likely planning conditions and to ensure that their infrastructure can meet the needs of the new facility. The outline strategy proposals are shown indicatively on NE02355-C-802-P1.

Communications with ScottishWater have comprised both face to face meetings and written correspondence. ScottishWater is shortly due to submit to GG&CHB the findings of its assessment of the water supply and sewerage disposal implications at the site for the proposed facility. In the absence of confirmation of ScottishWater's formal findings and based upon existing knowledge of the site, the following anticipates their findings and conclusions.

Foul Water

Foul drainage from the proposed facility will utilise the diverted combined (foul) drain running across the HSGH site. As part of the diversion works connection manholes with tails into the new development should be provided at the north-east corner of the facility. Other connections into the 375dia combined (foul) pipe may be provided around the proposed facility subject to the layout design for the drainage around the building perimeter.

As the existing foul water from the site outfalls into this network, no capacity problems are envisaged. However, a reduction in the amount of stormwater entering this pipe as part of the demolition works of older buildings is expected to greatly outweigh the increase in foul discharge therefore allowing the capacity to be used for the new development. Confirmation from ScottishWater forthcoming report will however be required to confirm this assumption.

Stormwater

A site-wide strategy for managing stormwater across the entire site is required as part of the larger re-development works. At this stage the ability to incorporate this is restricted due to the space constraints imposed by adjacent operational buildings.

In order to comply with Planning regulations and the requirements of both ScottishWater and SEPA, the use of a “management train” approach to dealing with stormwater in a sustainable manner through the use of SUDS (Sustainable Drainage Systems) is required. This must be planned and designed in accordance with published best practice guidance (CIRIA C697 -The SUDS Manual). Appropriately designed, constructed and maintained SUDS are more sustainable than conventional drainage methods because they can mitigate many of the adverse effects of urban stormwater runoff on the environment.

They can achieve this through:

- Reducing runoff rates, thus reducing the risk of downstream flooding
- Reducing the additional runoff volumes and runoff frequencies that tend to be increased as a result of urbanisation, and which can exacerbate flood risk and damage receiving water quality
- Encouraging natural groundwater recharge (where appropriate) to minimise the impacts on aquifers and river baseflows in the receiving catchment
- Reducing pollutant concentrations in stormwater, thus protecting the quality of the receiving water body
- Acting as a buffer for accidental spills by preventing direct discharge of high concentrations of contaminants to the receiving water body
- Contributing to the enhanced amenity and aesthetic value of developed areas
- Providing habitats for wildlife in urban areas and opportunities for biodiversity enhancement.

To mimic natural catchment processes as closely as possible, a “management train” is required. This concept is fundamental to designing a successful SUDS scheme – with drainage techniques in series incrementally reducing pollution, flow rates and volumes of runoff. Through effective control of runoff at source, the need for large flow attenuation and flow control structures is reduced.

The variety of SUDS components and design options are wide ranging and the following should be incorporated where possible to help deal with contaminants and lower/slow the stormwater run-off:

- Source control techniques
- Rainwater harvesting systems – for roofwater re-use for toilets etc
- Filter trenches - to treat run-off from car parking areas
- Swales - to treat run-off from car parking areas
- Pervious pavements - to treat run-off from car parking areas
- Geocellular systems - for stormwater attenuation storage
- Detention basins- for stormwater treatment and attenuation storage
- Ponds- for stormwater treatment and attenuation storage
- Stormwater wetlands- for stormwater treatment and attenuation storage

The larger masterplan for the site includes the provision of a large wetland/pond which may be utilised for attenuation storage as part of the wider development. Due to the staging process of the development this will not be constructed and operational for use at this stage and therefore the use of source control (permeable pavements) and buried tank attenuation should be considered for use prior to discharge into the diverted on-site drainage network.

As the stormwater for the existing buildings and related hardstanding discharges into the existing stormwater network, this is to be reutilised for the proposed facility. The peak stormwater flows must be restricted to a worst case that matches the existing discharge rates into this network and ultimately to the River Clyde outfall. This ensures that compliance to the existing agreements with SEPA and ScottishWater for this discharge are not jeopardised. It is likely that Scottish Water and SEPA will accept that this flow into the public system will remain and no further works are required to attenuate this discharge.

It has not been established if Scottish Water/SEPA will restrict the discharge of stormwater from this part of the development to the equivalent flow generated from green-field stormwater run-off. Should this be required as part of these works then significant SUDS techniques incorporating stormwater attenuation will be required. However, there are proposals to provide a number of water features at the site and this would provide ideal attenuation facilities for this and future schemes as/if required in lieu of buried tanks located beneath external areas.

The use of suitable stormwater run-off SUDS treatment techniques may be used in car park areas in lieu of the need for a petrol interceptor. This must be agreed with SEPA. Should more conventional surfacing materials and drainage be utilised, a petrol interceptor should be incorporated to intercept hydrocarbons prior to discharging into stormwater network. This must be alarmed and connected to the facilities management system to ensure suitable maintenance is carried out.

6.3.5 Medical Gases

Read in conjunction with drawings 3757/OXP/000-010, inserted in appendices A. These relay the approximate routes of the existing site oxygen infrastructure

There is currently a centralised oxygen compound currently located behind the existing A&E building. A new compound is to be installed behind the maternity building and connected into the existing oxygen network; this allows the existing pipework that crosses the PFI to be removed prior to the construction phase commencing.

A new oxygen VIE compound is to be provided to supply the new adult and Children’s hospitals; a new ring will be installed around the new buildings.

Following the completion of the PFI construction phase and the occupation of the new adult hospital, the redundant buildings on the site are to be demolished, with their related oxygen supplies (fed from compound behind A&E) made redundant and removed. Should the retained existing buildings require oxygen supplies from the site infrastructure then an additional compound may be necessary to serve these.

Any existing requirements for Nitrous Oxides, Vacuum and Medical Air are supplied by local plant and these will be retained/removed in relation to the spaces they serve. Where these gasses are required by the new PFI project, a view will be taken on whether these are to be centralised or localised in relation to the areas served/demand.

6.3.6 IT

Read in conjunction with drawings 3757/ITP/000-010, inserted in appendices A. These relay the approximate routes of the existing site IT/data infrastructure

There are two main incoming data/telecoms rooms, one in the listed building with utility cables coming in from the A739 bypass road and the other in the Outpatients building with utility cables coming in from the Govan road.

Prior to the commencement of the PFI construction phase the buildings within the site boundary are to be demolished and existing data/telecoms connections made redundant/removed. Some cables cross the site e.g. serving maternity; these are to be rerouted using the existing ducting running towards Hardgate road.

The new PFI site is proposed to be connected back to both incoming telecoms/data rooms so that there are two separate routes back to the centralised equipment. The Children’s hospital is to be used as a location to house new equipment and in the long term this could replace that in the Outpatients building, which will be subsequently demolished post PFI construction. Alternatively the equipment in the Outpatients building will require rehousing when this building is demolished.

6.3.7 Steam/ Condensate

Read in conjunction with drawings 3757/T33/000-010, inserted in appendices B. These relay the approximate routes of the existing site steam infrastructure

The existing site is provided with a limited amount of steam (mainly for heating purposes) from the centralised boiler room. The Estates team have already made a considerable effort to decentralise the heating systems and move away from steam heating. A new steam boiler house is to be installed and connected into the existing steam and condensate mains system, this will allow the decommissioning of the existing boiler house prior to the PFI construction works commencing.

Prior to the commencement of the PFI construction phase the buildings within the site boundary are to be demolished and steam/condensate connections will be made redundant/removed.

Post PFI construction the existing steam heating system is to be reviewed in relation to which areas of the retained buildings use the steam heating. Modifications to the steam system will either then be made accordingly or new LTHW plant installed, allowing the buildings that are to be demolished to be so and their related steam/condensate pipes removed. Thi is particularly relevant to the Listed building. Needs an explanatory sentence to make explicit why it is relevant?

6.3.8 Adaptability and Capacity for Expansion

The schemes above have allowed for future expansion based on the Campus Plan submitted by the Trust for planning in the Winter 2006 and are as follows:

WATER
For the site, this can be analysed once Scottish Water have completed their demand and infrastructure modelling. It is envisaged that the later phases of demolition (post PFI connection) will release existing capacity/usage from the Govan road supplies and the A739 (Moss road) supply. These and/or a connection from the new PFI supply from Govan road could then offer some capacity to provide single feed supplies to the future expansion spaces indicated on the drawings.

The new labs building (planned for construction pre PFI) will also need consideration in relation to the above, this is to be included when Scottish water complete their analysis.

POWER

For the site, in our discussions with Scottish Power we have allowed for a future site capacity (post PFI construction and demolition) of 15kVA. However Scottish Power is considering this in relation to the site wide supply and thus the final solution when agreed with Scottish Power may to differ from the strategy outlined above and indicated on the drawings. This is therefore subject to further discussions and feedback from Scottish Power.

For the PFI hospitals, electrical power consumption is likely to rise over the PFI term as electrical equipment and IT usage increase that will result in a corresponding increase in the requirement for spot cooling. Load increases are more likely in the clinical “hot” areas rather than the ward areas. We have included +20% increase from the initial load to MD as HTM 06-01 (Table 2 “Growth Factor”) included within the 15MVA site load and 10MVA associated with the PFI Hospitals and allowed for in the design of the incoming supply switchgear and MV distribution to the hospitals to provide scope for additional supply needs without a major refit.

Greater low or zero carbon electrical and heat generation are likely over the PFI term to reduce carbon emissions from the hospital and as the cost of energy rises, alternatives such as on site generated energy may become economic, eg PV cells, additional or hydrogen based CHP. The centralised energy centre provides an adaptable infrastructure that will be able to respond to these changing needs and circumstances.

NATURAL GAS

For the site, the quotation/confirmation from SGN Connections is an additional load to that of the current existing infrastructure. The pre and post PFI building demolition will release existing capacity/usage from the existing Govan road supplies; these can then provide supplies to the future expansion spaces indicated on the drawings. The load for the new labs building has not been included in our discussions with SGN.

For the PFI hospitals we do not see gas consumption rising significantly over the PFI term. It is likely that the nature of the supplied gas will change over the PFI term as natural gas is replaced by synthetic or “biogas” and that the installations will need to be adapted at this time.

MEDICAL GASES

For the site, should the future expansion spaces require oxygen to be supplied from the centralised plant, then the existing plant located behind the existing A&E building will become redundant at that time. This, therefore, provides capacity to supply these areas and to link into the existing site network as required. This is also a strategy that may be able to serve the Labs building.

IT

The incoming data/telephone lines and centralised equipment capacity are to be reviewed and defined by the client’s specialists.

ENVIRONMENTAL STRATEGY AND APPROACH TO INTEGRATED DESIGN

The environmental strategy is based on:

- good environmental conditions are required for staff, patients and visitors
- energy use is to be minimised using systems and plant most appropriate to the hospital environment. As a starting point total energy use including small power and medical equipment loads are not to exceed 55GJ/100cm in any year (delivered energy).

  Ongoing energy reductions should at least ensure that energy use per unit volume or area do not increase with time and offset additional load as use changes/develops.
- 20% of the energy use above is to be “low or zero carbon” as defined by the Scottish Building Regulations
- Every five years, the contribution of energy reduction and low or zero carbon energy as a percentage of total consumption is to be increased by five percent.
- system and plant/component selection is to be based on lowest life cycle cost

In order to produce robust solutions the design follows the following hierarchy:

- Make the building energy use as low as possible by investing in the building fabric. This will have a good payback as the building fabric life is long and the installations are not dynamic requiring little additional maintenance over and above standard typical solutions
- select appropriate environmental strategies. Design the building so that it offers flexibility to meet changing needs and economic and social drivers with success in the future

The environmental strategy is based on a sealed building with mechanical ventilation. This follows from an appraisal of the ventilation options for Ward Areas presented to the client in March 2007 which attempted to explain and balance the competing design and operational drivers.

To accommodate the extensive vertical and horizontal services runs that will be required for the new hospital facility both in the tower and podium areas as well as to the laboratory block, the design should take due cognisance of this requirement and for the availability of services openings, corridors/routes and penetrations.

Services routes should be fully integrated with the structural design for the buildings to ensure proactive inclusion to accommodate the full extent and range of service types, services proximity, future adaptations and maintenance. This should address issues including wall and floor penetrations, floor and ceiling routing, protection and containment and to ensure that all structural load paths remain uncompromised under all circumstances.

The establishment of the requirements for the provision of dedicated services routes between different hospital buildings and within separate parts of the adults and Children’s facility should be adopted at an early stage of the design to ensure that full effectiveness and interoperability of all plant rooms, roof mounted equipment, basement plant and link corridors is achieved.

The services strategy should allow for the requirements of the facilities energy centre, electrical sub-stations, gas pressure reduction stations, gas/fire suppressant bottle stores, water tanks, HVAC equipment, helicopter servicing, fire-systems, steam and other mechanical services including all specialist services i.e. medical gases.

The structural building frame that is adopted should be selected on the basis of other site constraints to allow planned and pro-active inclusion for services routes and plant room sizing and location.

6.3.9 Ventilation

Required Conditions

It is important that the ventilation approach for the Adult and Children's hospitals fulfil the primary requirement to provide adequate:

- supplies of fresh air
- odour dilution
- removal of airborne contaminants or pathogens

Detailed quantified requirements relating to internal environmental conditions can be found in Department of Health Estates & Facilities Division publications. These publications are in the process of being rationalised. The current ventilation standard SHTM 2025 will shortly be superseded by HTM 03-01 'specialised ventilation for healthcare properties'. A draft version of this new standard has been circulated. The HVAC design is in accordance with its requirements.

Site Constraints

It is important that the ventilation approach takes into consideration the constraints of the site. These have been identified as:

*Smells from adjacent sewage treatment plant*
Scottish Water's Sheildhall Sewage Treatment Plant lies approximately 400m north of the site. Staff and patients using the existing hospital buildings on the site experience a constant low-level of odour from the plant. After heavy rain the odour becomes more pronounced and unpleasant. Although there are intentions to remedy or re-locate the sewage treatment plant, there are no concrete plans or timeframe for this work. There is a major risk, therefore, that the odour issue will not be resolved before the opening of the Hospitals. SHTN 30 'Infection Control in the Built Environment' states that although odour in itself does not present a direct risk, if it leads to ventilation being restricted it may in turn increase the risk of hospital acquired infections.

*Construction noise, dust & contamination*
The construction of the Adult and Children's Hospitals is to be staggered. This means that there will be a period when the Children's' Hospital is operating and the Adult Hospital is being built. It is important that the ventilation approach limits the intrusion of construction noise, dust and contamination while ensuring adequate ventilation.

It is important that the laboratories on the site do not contaminate ventilation air drawn into the new hospitals. A detailed site airflow assessment needs to be carried out to confirm that this will not be an issue.

Mechanical Ventilation

The Clinical Areas, Wards and the remainder of the main hospital buildings are to be mechanically ventilated throughout. This decision has been made because mechanical ventilation offers the following advantages over natural ventilation:

- smells can be eliminated from incoming air through activated carbon filtration.
- dust can be filtered from incoming air.
- external noise from site construction can be attenuated through the incoming air path
- for clinical areas robust and reliable control of environmental conditions is required for the spaces to function correctly and efficiently. The control airborne infection by room air flow control and dilution by enclosure and mechanical ventilation is essential.

Additionally mechanical ventilation provides the additional benefits of:

- helping to control airborne infection by allowing points of air intake and discharge to be carefully separated to avoid recirculation, good dilution of room contaminants/pathogens, and by allowing pressure differentials to be created to facilitate the flow of air from clean to less clean areas.
- allowing air to air ventilation heat recovery, thereby significantly reducing the running costs and carbon emissions associated with space heating and cooling of ventilation air.
- allowing incoming air to be cooled prior to being supplied to spaces to ensure good thermal conditions. This provides a system that for patient and staff areas do not exceed the draft HTM 04-01. This recommends that temperatures of 28°C are not exceeded for 50 hours a year.
-

In addition, as the heliport is to be constructed on the roof of the Adult Hospital tower, mechanical ventilation will avoid drafts through windows and help limit noise.

High building air tightness is required to exclude infiltration and odour. The buildings will be slightly pressurised.

Energy Reduction Measures

The Hospitals are to incorporate the following measures to reduce energy consumption associated with HVAC systems:

- windows in ward and office areas are to be fitted with external adjustable shading devices such as adjustable mid pane louvres or blinds. These will reduce peak solar heat gains to allow good thermal conditions within well day lit spaces and minimize the requirement for mechanical cooling in these areas. Shading Factor "SF" > 70%.
- exposed thermal mass, where practical, to limit temperature swing and reduce peak temperatures. Patient rooms are to have exposed concrete soffits.
- air to air heat recovery in all air handling units.
- variable ventilation rates by fan speed control for spaces with demand control (eg odour, ammonia)

General Plant Design & Distribution for Infection Control

Each hospital department is to contain its own dedicated air handling plant. Larger departments, such as inpatient wards, are to be zoned with separate air handling plant serving each zone. This is to ensure that in the event of mechanical failure, or during maintenance or refurbishment only a limited area is affected. Critical care units are to be served with back-up air handling plant.

Air handing plant at podium roof level are to serve the main body of the hospitals as well as the lower half of the adult hospital tower. The top half of the tower is to be served by air handling plant installed in the tower roof. Fresh air intake and discharge louvres are to be installed at these levels, carefully separated to avoid recirculation.

Supply and extract ductwork is to be distributed to the hospital departments via risers. Where possible these risers are to be located off main circulation routes to facilitate access for cleaning and maintenance. Horizontal distribution is to be in ceiling voids above corridors, wherever possible, so that access panels can be located outside clinical areas. Similarly, trimmer coils are to be installed above circulation areas wherever possible to avoid potential leaks in clinical areas, which would lead to greater disruption and potential damage to expensive equipment.

The ductwork distribution system is to be a low pressure system. Smoke dampers will be installed through all fire and smoke compartments. Access panels are to be installed in accordance with DW142 to allow adequate inspection, maintenance and cleaning. Flexible ductwork is only to be installed for final connections to grilles and diffusers.

Diffusers and grilles are to be carefully chosen to allow them to be easily removed and cleaned to limit airborne contamination.

Air handling plant is designed to comply with draft HTM 03-01 requirements, and includes, in addition to the base provision of inlet filter, heating coil and fan/attenuators the following:

- inspection, cleaning and maintenance access sections either side of all coils and dampers, upstream of all filters and downstream of all humidifiers.
- blow-through configuration of fans to ensure as much of the unit is under positive pressure as possible.

The following sections are generally to be incorporated into all air handling units:

- fog coils.
- cooling coils
- temporary pre-filters (G1/G2) to allow removal of dust while construction work is ongoing.
- steam injection humidifiers
- activated carbon filters for odour removal

Specialist Ventilation Areas

*wards*
Ventilation plant will be zoned by elevation and space type/function.

Patient rooms and multi-bed bays are to have local temperature control through the installation of heating trimmer coils on individual room branch pipework. Space humidification and cooling will be by the supply of cooled ventilation air without

individual room temperature control In individual rooms temperature and external motorized solar shading control is to be built into the bed-head controls. In multi-bed bays controls are to be installed at a central location. Temperature control is be primarily automatic with sensors in each space, however local controls are to allow limited adjustment of the set-point for a limited period after which the temperature control returns automatically to its pre-set set-point.

Patient rooms and multi-bed bays are to be kept at a lower pressure relative to their adjacent corridors, and so in addition to the air supplied directly to these spaces additional air will pulled in under doors. Air is to be extracted through ensuite shower rooms as well as additional grilles located above the ensuite shower room doors. The air change rate in these spaces is to achieve the draft HTM 03-01 requirement of six air changes per hour. However, apart from specific wards where clinical experience indicates that odours are likely to be strong and persistent, such as the geriatrics wards, the controls are to set the air change rate at four air changes per hour with local pushbuttons to allow the rate to be boosted to six air changes per hour for a limited period. Buttons are to include bypass key control to allow the air change rate to be locked at six air changes per hour if this proves desirable.

*critical and intensive care*
These are to be air conditioned spaces with full temperature and humidity control.

*operating suites*
Each conventional operating suite is to be installed with its own air handling unit. Fresh air is to be delivered in accordance with draft HTM 04-01 at 25 air changes an hour. Operating suites are to be controlled in such a way so that when vacant, ventilation plant is turned off to conserve energy. In the operating theatre air is to be supplied through the high-level terminal canopy and expelled at low-level through pressure stabilizers. Pressure stabilizers are to be installed on all four sides or in all four corners of the room, and to be visible so that they provide a visual indication that the ventilation system is running.
Ultra clean ventilation operating suites are to be delivered with the same amount of fresh air as conventional suites, however an additional recirculation air handling unit is to be installed to increase the flow through the terminal to ensure laminar flow and a count of less than 1 colony forming unit per cubic meter. A high-efficiency HEPA filter is to be installed before the canopy. The recirculation unit is to be remote, to allow inspection and maintenance to be carried out outside the theatre. The canopy is to be of the vertical flow type.

*isolation suites*

Isolation suites will be dedicated plant designed as HBN 4 Supplement 1 to provide isolation. This relies on an air tight enclosure and a lobby positively pressurised with respect to the room and corridor.

Ventilation System & Fire Strategy

In certain critical care departments it is preferable to maintain the supply ventilation in the case of a fire within the area, for example the continued supply of air to a theatre will maintain it at a positive pressure and protect the patient and staff from the effects of smoke. The ventilation plant is not designed to be automatically shut down on the operation of the fire alarm and detection system, but under the instruction of the fire-and-rescue service and controlled from panels located either at department entrances or adjacent to the main fire alarm indicator panels at the entrances to the buildings.

Fire dampers are to be installed in all ducts penetrating fire compartment and sub-compartment walls. In compartment walls fire dampers are to be actuated on the operation of the alarm and detection system in the compartments either side of the compartment walls. In sub compartment walls dampers are to be activated by thermal release devices.

All supply AHU's are to have a smoke sensor mounted in the main supply duct immediately downstream of the AHU. In the event of a fire in the AHU or smoke being drawn into the system from an outside source the supply air damper is to close and the AHU is to be shut down.

A mechanical smoke extract system is to be installed in the basement of the hospitals. (The installation of a sprinkler system in the basement allows mechanical smoke extract to be considered as an alternative to conventional smoke vents.) This system is to provide at least ten air changes per hour and be capable of handing gas temperatures up to 400°C for an hour.

6.3.10 Heating

HOSPITAL INFRASTRUCTURE
Central Boilers & distribution

The plant for both the Adult and Children's Hospital is to be centralised and located in a separate Energy Centre. The system philosophy is shown on SK021. The plant shown will provide heating for fabric, ventilation and domestic hot water needs for the two hospitals. Separate steam generation plants will be required for humidification and sterilisation.

The heating system located in the Energy Centre will be a Medium Temperature Hot Water System (140/65 °C). The boilers to be used are high efficiency, low Nox, 3 pass high water content boilers with pressurised burners that operate on alternative fuel supplies of natural gas and 35 second light oil. Burners to be digital modulating with variable speed and air damper control capacity control to achieve a high turndown ratio (10 to 1 turndown on natural gas). Low NOx (<70mg/KWhr natural gas) burner with oxygen trim control.

The boiler configuration employs an effective (N+1) redundancy at peak connected design load (effective N+2 at part load). Each boiler is to have its own discreet insulated and clad flue. The flue stack to be an independent stainless structure to allow the flue to discharge above the level of the tower with space to accommodate other services requiring high level discharge.

The MTHW will be distributed via separate highly insulated district heating mains to the Adult and Children's Hospitals run within the basement service route between the Energy Centre/Loading Bay and the Hospitals. Heat exchangers convert the MTHW to LTHW (90/70 °C) locally for room heat emitters and air trimming coils.

It is envisaged that the pipework installation will consist of a mixture of modern and traditional materials. The whole of the heating system will be chemically dosed and treated as appropriate. All pipework and fittings are to be highly insulated to minimise heat loss and heat gain to the hospital spaces. Insulation will be 50% thicker than the minimum economic thickness.

All pumping arrangements will include redundant standby pumping. The majority of the main pump sets will consist of 3 no. pumps rated at 50% duty while the smaller pump sets will consist of smaller run and standby pumps rated at 100% duty.

In order to optimise energy usage 2 port control valve technology and variable speed pumping will be employed throughout. Differential pressure control valves shall be used on all sub-circuit branches.

Gas Combined Heat and Power

At present a 1.5 MWe gas supplied spark ignition reciprocating engine combined heat and power installation has been included in the base scheme. The exact size of the CHP plant will be reviewed once detailed electrical and heat load analyses have been completed for the site and the economic case for CHP can be explored in detail with a turnkey operator. Additional CHP capacity in the future provides scope for increasing the proportion of "low carbon " energy supply.

The CHP unit is to be located in the Energy Centre. Heat will be recovered from the unit engine jacket, engine cooling system and exhaust gases via a shunt pump circuit connected to the main boiler return distribution pipework. Once the exact size of the unit is known it may be beneficial to employ a separate heat recovery boiler. The CHP unit will have its own separate flue. It is envisaged that the unit will operate whenever the heat and power can be fully utilised.

Domestic Hot and Cold Water

The domestic hot and cold water installations will be installed to potable quality standards throughout the whole of the Hospital development.

There shall be dual and separate water supplies to the Adult and Children's Hospitals. The total hot and cold water needs for each building shall be met by water storage located in each building. Each building shall have sufficient water storage to meet 24 hours requirement. The preferred option for the water storage and distribution is as follows.

- Main storage tanks located in basement, no break tanks, pumped distribution system, with duty standby pump sets and controls and generator back electrical supplies to the pumps. Trust approval for this option will be required.

The location and number of independent hot water heat stations is shown on SK023. Each heat station location is sized on a (N+1) basis. Hot water shall be delivered to individual wards and departments via a traditional two pipe circulation system.

The whole of the potable hot and cold water installation will be designed to meet all the legionella requirements. In particular the water storage tank connection arrangements allow for zero dead legs and the heat station installation allows for continual calorifier circulation with zero stratification. All pipework is to be insulated to minimise heat loss or gain as appropriate.

Particular emphasis is to be put into ensuring that there will be the minimum number of hot water returns, that there will be adequate insulation on the cold water installations to avoid temperature build up and that there will be regular flushing of cold water dead legs by means of appliances connected to the same.

The laboratory areas will be provided with similar hot and cold water installations employing separate break tanks and separate calorifiers to ensure full segregation between laboratory and domestic installations thus meeting the requirements of the Water Regulations.

Pipework installation within both hospitals will be run within individual level ceiling voids to ensure any particular ward or department can be isolated at that level only.

Room Heat Emitters

Where room are mechanically ventilated heating and ventilation rates are sufficient to provide good room air mixing/destratification, heating will be provided by air room reheat coil with 2 port water control valve and room temperature controller.

For areas with extensive glazing and/or natural ventilation, heating will be from perimeter heating; either high level radiant panel or low level convector.

6.3.11 Cooling

General Chilled Water

In order to meet the annual cooling requirements of the development and the requirements of HTM 3, chilled water installation will be required.

The preferred chilled water system configurations are shown on SK019.

- The configuration shows discreet chiller installations adjacent to the air handling units they serve. As a (N+1) redundancy philosophy has been utilised for each chiller cluster, a separate process chilled water system will be installed utilising free cooling chillers.

The chilled water equipment shall include chillers, buffer vessels and pressurisation units. Each chiller will be of the fully packaged air-cooled type complete with multiple modular screw compressors. The chiller will be rated as residentially quiet to avoid unobtrusive noise emissions. Chillers to have variable speed head pressure control with load and efficiency optimised head pressure and chilled water flow temperature control to improve seasonal efficiency.

The chilled water circuits will consist of both primary and secondary pumping. In order to optimise energy usage, 2 port control valve technology and variable speed pumping will be employed throughout. Differential pressure control valves shall be used on all sub-circuit branches.

All pumping arrangements will include redundant standby pumping. The majority of the main pump sets will consist of 3 no. pumps rated at 50% duty while the smaller pump sets will consist of smaller run and standby pumps rated at 100% duty.

Chilled water will be distributed through a conventional 2 pipe system to the various demand centres throughout the building. The installation will employ a number of traditional and modern materials. The entire chilled water system will be chemically dosed and treated as appropriate. All pipework is to be insulated to minimise gain.

ITC Cooling

Independent chilled water system as above but with free cooling roof mounted air cooled water chillers. N+2 redundancy with plant backed by the essential electrical supply.

6.3.12 Drainage

The rainwater drainage system in each hospital shall be gravity systems. The rainwater pipework in each hospital shall be housed in vertical risers and will be insulated to prevent condensation and noise transfer.

The soil and waste drainage system in each hospital shall be gravity systems. The systems generally shall be vented to atmosphere above the roof. It is envisaged that the pipework installation will consist of a mixture of modern and traditional materials. Separate chemically resistant drainage will be installed in all specialist areas.

6.3.13 Artifical Lighting

General lighting to all areas by low energy fluorescent light sources. All control gear to be high frequency, high power factor (PF>0.95), low harmonic emission light fittings equipped with electronic control gear. No switch start gear light fittings permitted.

Efficient light sources and luminaires will be used.

Lighting is a substantial user of energy in hospitals and buildings generally. Often the light level and energy use can be varied because natural light is available or because the need for light is reduced. In summer the removal of heat from light fittings is important to prevent overheating of spaces. As lamps age and fittings/lamps get dirty over their cleaning cycle, the light output will fall. Room photocells and dimming can adjust the output of the lamp down when clean, to reduce energy use and heat gain. For each space the potential for lighting controls will be examined and the appropriate lighting controls will be installed.

Lamp and lighting gear monitoring provides a cost effective solution to lamp/gear maintenance.

| | |
|---|---|
| day lit spaces | fitting dimming controls and room photocells to provide dimming and off control |
| spaces subject to intermittent occupancy | occupancy detection to switch lights off when the room is not in use |
| all spaces | fitting dimming controls and room photocells to provide lamp output control as lamps age/fittings get dirty<br>lamp and gear monitoring and alarming for lamp/gear maintenance |
| external lighting | time and light level control of all external lighting |

Design Light Levels:

as HTM/HBN & CIBSE guidance

Lighting Circuits:

Final circuit cabling shall generally consist of LSF insulated single core cables to BS7211 enclosed and protected within metal conduit. All final circuits shall be provided with full size single core circuit protective conductors.

All electrical accessories/socket outlet switch plates shall be stainless steel finish in Category 3, 4 and 5 areas. Offices and administration (non-patient areas) could be of alternative materials (i.e. plastic).

Escape light fittings throughout the building wards will be supported by the secondary power supply system with fittings distributed over at least two (Side A and Side B) interleaved circuits. In the event of a failure on Side A (final circuit, rising busbar, distribution board, main switch panel or supply transformer), then power will still be available from socket outlets connected to Side B circuits.

V40 Emergency Lighting

Generally, secondary lighting to Grade A or Grade B will be provided to all areas of the building depending on clinical risk category. All secondary lighting will be fed from the secondary power power supply (SPS) with reconnection within 15 seconds, following failure of the incoming mains supply (see drawing: V[20]-500). In accordance with HTM 06-01, all areas that require standby lighting will also be provided with emergency lighting.

Emergency escape lighting will be provided to all areas of the buildings to meet the requirements of BS5266 and HTM2011 Generally, emergency lighting will be provided in the form of self contained light fittings with their own integral battery packs to provide up to three hours autonomy in the event of complete power failure.

6.3.14 Electrical Lighting

Introduction

This section describes the electrical services solutions proposed in response to the Trust's design brief and the proposed architectural scheme.

The text descriptions should be read in conjunction with the schematic drawings scheduled in Appendix C, these together detail the full extent of the provision of the electrical power building services.

The existing switchgear and distribution is undergoing some refurbishment and renewals in preparation for the commencement of the New Hospitals development and reorganisation of the retained site electrical supplies. As part of this initial work, the capacity and resilience of the existing medium voltage (MV) networks has been assessed and found to be inadequate to support the proposed new Adult Acute and Sick Children's hospitals. These issues must be addressed within the new development and are as described below.

The new hospitals will be constructed whilst the existing hospital buildings continue to function and therefore additional capacities will be required which the existing infrastructure cannot provide. Our recommendations are that:

- the existing MV distribution is retained and reinforced to serve the existing hospital site and buildings.
- to allow phased constructions of the new hospitals, they are served by their own dedicated MV distribution systems.
- to meet the electricity supply requirements for the completed development, a new primary substation is constructed.

After successful commissioning it is envisaged that the new hospitals will be progressively brought into use by means of a phased decant from the existing accommodation on the site. Once this has been done, the existing hospital buildings can then be de-commissioned and demolished without affecting the engineering systems of the new hospital development.

Discussions have progressed with Core Utilities (Scottish Power) to provide new services connections and incoming supplies. This process is not yet complete and at the time of writing formal responses are awaited.

Electrical Load Assessment for the NSGH Site

A review of hospital electrical loads has been carried out, including site visits to recently completed PFI hospital projects at The Edinburgh Royal Infirmary and University College London Hospital. These loads are given below.

Existing South Glasgow Hospital Loads:

- Available maximum demand = 2.6MVA
- Actual maximum demand = 2.6MVA
- Site floor area = 91,500 $m^2$ approx
- Load = 28.5VA/$m^2$

Edinburgh Royal Infirmary Loads:

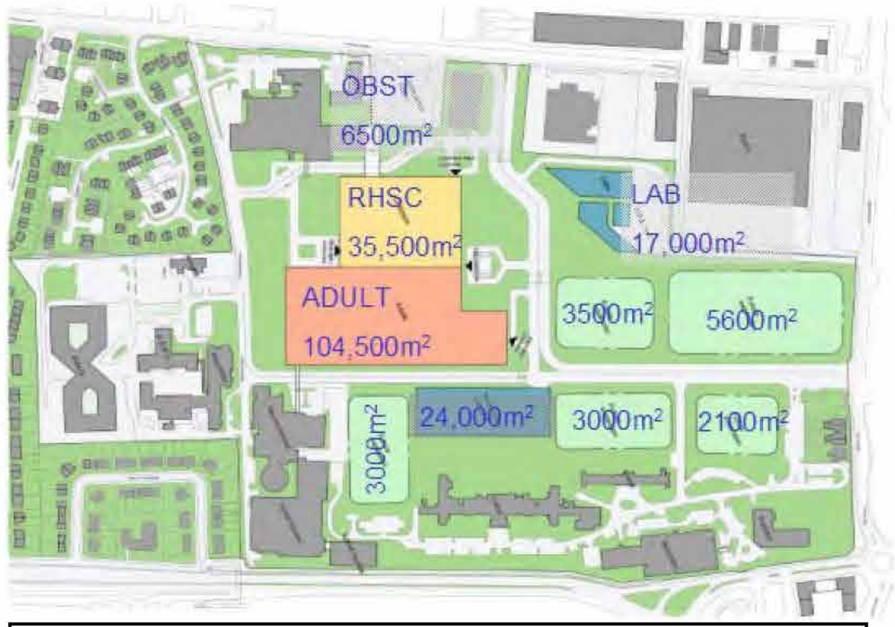
- Available maximum demand = 8MVA
- Actual maximum demand = 6MVA
- Site floor area = 125,241$m^2$
- Load = 48VA/$m^2$

UCLH – London Loads:

- Actual maximum demand = 3MVA
- Site floor area = 75,000$m^2$
- Load = 40VA/$m^2$

The proposed electrical development of the South Glasgow Hospital site assumes the provision of supplies to the following areas:

- Multi-storey car park – 24,000m2
- New laboratory – 17,000m2
- New Obstetrics Dept – 6,500m2
- Adult Acute – 104,500m2
- Sick Children's – 35,500m2
- 'Future Expansion' – 17,000m2



Assumed approximate areas showing type and area of future developments on the South Glasgow Hospital Site.

Figure 29 Assumed Approximate Areas

The following electrical loads for each development have been assumed:

- Multi-storey car park – 8.0VA/m2
- New laboratory – 60VA/m2
- New Obstetrics Dept – 50VA/m2
- Adult Acute – 50VA/m2
- RHSC – 50/VAm2
- 'Future Expansion' – 40VA/m2(Single Storey)

The table below shows the estimated electrical loads for each area with assumed maximum demands and diversities. The following maximum demands have been taken for the new hospitals:

- Royal Hospital for Sick Children (RHSC) = 2.5 MVA
- Adult Acute Hospital (AAH) = 6.5 MVA

Table 1

| Description | Estimated Bldg Available MD MVA | Assumed Building Diversity % | Building Diversified MD MVA | Approx floor area m2 | Approx Bldg diversified load VA/m2 | Available MD as VA/m2 |
|---|---|---|---|---|---|---|
| SGGH - existing | 2.6 | 95% | 2.5 | 91,451 | 27 | 28 |
| | | | | | | |
| Multi-Storey car park | 0.3 | 80% | 0.2 | 24,000 | 8 | 10 |
| With New Lab | 1.3 | 80% | 1.0 | 17,000 | 61 | 76 |
| With New Obstetrics | 0.4 | 75% | 0.3 | 6,500 | 40 | 54 |
| Acute Adult | 6.5 | 0.80 | 5.2 | 104,433 | 50 | 62 |
| RHSC | 2.2 | 0.80 | 1.8 | 35,523 | 50 | 62 |
| At PP2 | | | | | | |
| At PP3 | | | | | | |
| Future expansion residual | 1.0 | 70% | 0.7 | 17,000 | 41 | 59 |

The table below shows how the site electrical load may vary during the development of the site. From the existing site load of 2.6MVA, it reduces to 2.3MVA during initial site clearance and then rises as new buildings such as the new multi-storey car park, laboratory and Obstetrics Department are added.

Table 2

| Description | Estimated Site Available MD MVA | Assumed Site Diversity % | Site Diversified MD MVA | Approx floor area m2 | Approx Site diversified load VAm2 | Available MD as VAm2 | Utility Supply |
|---|---|---|---|---|---|---|---|
| SGGH - existing | 2.6 | 95% | 2.5 | 91,451 | 27 | 28 | Existing |
| At PP1 | 2.3 | 95% | 2.19 | 81,089 | 27 | 28 | Existing |
| Multi-Storey car park | 2.6 | 75% | 1.9 | 105,089 | 18 | 24 | Existing |
| With New Lab | 3.9 | 75% | 2.9 | 122,089 | 24 | 32 | Enhanced Existing |
| With New Obstetrics | 4.2 | 75% | 3.2 | 128,589 | 25 | 33 | Enhanced Existing |
| Acute Adult | 10.7 | 0.80 | 8.6 | 233,022 | 37 | 46 | New |
| RHSC | 12.9 | 0.80 | 10.3 | 268,545 | 38 | 48 | New |
| At PP2 | 12.6 | 75% | 9.4 | 261,045 | 36 | 48 | New |
| At PP3 | 11.9 | 75% | 8.9 | 243,971 | 36 | 49 | New |
| Future expansion residual | 12.9 | 75% | 9.6 | 260,971 | 37 | 49 | New |

Whilst these early developments can be undertaken with the existing incoming electricity supply being upgraded to 5 MVA, the new RHSC and Adult Acute hospitals cannot be supported by the existing supply. A new electricity supply with the capacity to help deliver at least 13MVA to the site in total will be required. With a growth factor of between 15-20%, a new supply of around 15MVA will be required.

A supply of this size will require a new Primary Substation to be established on or near the South Glasgow Hospital Site. This substation will take electricity at 33kV and step it down to 11kV for distribution around the site. As phased construction takes place, a growth in load will be required as shown on the Primary Load Assessment illustration.

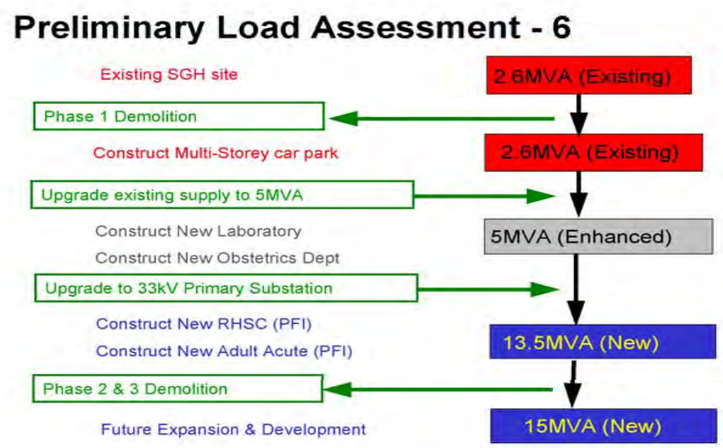


Figure 30 Preliminary Load Assessment

Electrical Services Scheme

Early work by Max Fordham LLP centred around issues of reliability, resilience and redundancy. The old Health Technical Memoranda (such as HTM 2007 and HTM 2011) offered little guidance with respect to system reliability and resilience.

HTM 06-01 'Electrical Services Supply and Distribution' published in April this year, offers clear guidance on resilient systems design and supports much of the approach already developed by Max Fordham LLP.

The principle strategy for the new RHSC and Adult Acute hospitals is for a Dual-Unified distribution system comprising of separate primary and secondary circuits collectively forming the electrical distribution of the new hospitals. The secondary supply is to be equal to the primary supply; that is, both primary and secondary circuits are fully rated to provide resilient distribution. Consequently, it is not appropriate to talk about 'essential' and 'non-essential' supplies. Instead, the alternative supplies are called 'Side A' and 'Side B'.

The intention is to place the first single point of failure as close to the final sub-circuits as practical.

Medium Voltage Distribution

Medium Voltage (MV) distribution will be at 11kV. The Distribution Network Operator (DNO) will provide electricity metering at 11kV, with separate metered supplies to the existing SGH site and the RHSC and AAH development. MV distribution at 11kV will be from new 11kV primary switchgear located adjacent to the primary substation (See drawing SK-050).

Resilience is to be achieved by having dual incoming electricity supplies from the DNO, dual distribution circuits at 11kV and a secondary power supply system (SPS) utilising standby generation diesel engines to generate electricity at 11kV in the event of failure of the DNO supply. At this time, the DNO (Core Utilities) may only be able to provide a single incoming supply at 33kV which is less resilient than the dual incoming supplies recommended by HTM-06-01. At this stage, therefore, to provide improved resilience and make up for this apparent shortfall in coming supply resilience, additional standby generation capacity is proposed.

Vacuum circuit breaker switchgear contained within two separate purpose-built architect-designed switchgear rooms with blast relief blow out panels and raised access floors are to be provided. Cable entry and exit will be from under floor and underground trenches. Circuit breakers will be of the withdrawable pattern.

To maintain resilience, a 4 hour separated blast relief wall will be required between adjacent switch rooms.

MV distribution to the RHSC and the Adult Acute hospitals is to consist of separate closed unit protected auto-switching ring mains dedicated to each hospital. Unit protection will be by pilot cables and time graded relays. This approach has some resilience advantages and enables construction of the two hospitals to be phased. A full instrumentation and protection system with multi-function meters, overcurrent and earth fault protection to the primary ring mains will be provided.

MV Cables and Containment

To provide resilience, and where possible, Side A and Side B cabling should follow separate routes. MV cable distribution to be run from the energy centre to the hospitals will be protected within the walk through basement corridor, fixed to the soffit or side walls. Side A cables will run along one side and Side B cables along the opposite side. Additional mechanical protection will be provided to protect the cables against damage.

All MV cables forming part of the MV distribution network will require a copper conductor as part of the armouring of the cable. Multi-core XLPE insulated steel wire armoured cables manufactured to BS6622 contain a braided copper tape within their construction that acts as an earth fault conductor.

Within the buildings, the MV cabling will run horizontally, concealed above false ceilings or at high level in the basement. Vertical distribution will be within dedicated risers. Generally, MV cabling will be run cleated to ladder racks. Side A and Side B supply cabling should follow independent routes which require separate risers. Risers containing MV cabling should not contain any other cabling.

Transformer Reliability & Resilience Issues

According to HTM 06-01 transformer reliability can be as high as 99.999% . This equates to being 0.0001% unreliable which could mean 5.25 minutes unavailability per year. However, the issue is more to do with the time to repair or replace a faulty transformer, which may be at least one week. It may even take up 6 or 12 weeks between placing an order and taking delivery of a new transformer. There are advantages in standardising on a limited number of transformer types and sizes and even retaining some on site as spares ready to be installed.

In accordance with HTM 06-01, the transformers serving areas of a healthcare facility with a Clinical Risk Category 4 or 5 are to be arranged in pairs and to operate at no more than 50% load. In the event of a transformer failure, or the failure of the MV supply to the transformer, the load can be transferred to the remaining healthy transformer which will then run at rated capacity (100%).

A typical Packaged Substation with the LV switch panel on the left and the cast resin transformer housed within its enclosure on the right.

It is important that paired transformers operating in this way are housed in separate rooms to prevent a problem affecting one transformer, or its associated MV switchgear, affecting the other. The drawing SK-051 indicates a transformer housed with its associated 11kV switchgear so that all MV plant and equipment is contained within the same room. This may have advantages, depending on the maintenance regime proposed, as it allows equipment to be maintained without loss of service. Alternatively, transformers could be located adjacent to the respective LV switch panel served, taking the form of a packaged substation.

Transformer Provision

From a unit cost view, there appears to be very little difference between oil filled or cast resin (dry type) transformers.

Oil filled transformers are an inherent fire risk and precautions must be taken against explosion and fire spread. Precautions must also be taken to contain oil, which may leak from the transformers, through the provision of appropriate bunding. The fire risk can be reduced slightly by using alternative fluids such as silicone or MIDEL, as these have higher flash points.

Dry type transformers pose a lower fire risk than oil filled units. They offer far more flexibility in location, and so are the unit of choice when locating them within buildings because they are:

- Self extinguishing
- Resistant to pollution and condensation
- Require reduced maintenance (no liquid dielectric)
- Easy to commission

Tranformers are to be located on roof-level plant spaces within dedicated insulated enclosures. They are to be naturally ventilated through louvres.

Cast resin transformer housed within IP31 sheet metal enclosure.

Cast Resin transformers are less of a fire risk than oil filled units.

The proposed transformer sizes are indicated in Table 3

Table 3

| Hospital | Rating (k VA) | Quantity | Dimensions L x W x H (mm) | Weight (kg) |
|---|---|---|---|---|
| RHSC | 1600 | 4 | 1820 x 1050 x 2435 | 3880 |
| Adult Acute | 2000 | 8 | 2200 x 1300 x 2850 | 5340 |

Drawing SK-051 shows a typical transformer MV switch room with associated LV switchroom space for 1.6MVA – 2.0MVA transformers.

Transformer Maintenance Access

All the transformers will be located at roof level on the Adult Acute Hospital Tower, Podium and the RHSC. It will be necessary to provide maintenance access to each transformer substation to enable plant replacement to take place " without the need to dismantle individual HV switches, circuit breakers or transformers".

The current proposal for the transformer installation and replacement strategy is by hoist in the FM lift shafts, which extend to roof-level: lift cars will need to be taken down to basement level and be of the underslung type to keep cables to the sides of the shaft. Suitable lifting beams are to be installed at the top of the shafts. During the further design development, the alternative strategies of increasing the duty of the lifts to cope with the weight of the transformers (5.5 tonnes), and of installing fixed cranes on the roof are to be explored.

Standby Generation Reliability and Resilience Issues

For a healthcare facility of this type, HTM 06-01 recommends that the resilience and redundancy to be achieved should be at least N+1. The maximum demand for the combined adult and Children's hospitals has been estimated to be 8.7MVA. Including an allowance for future growth in accordance with HTM-06-01, this suggests that a maximum demand of 10MVA with 100% standby generation would seem appropriate. This would require a minimum of 4 no. generator modules with continuous rated outputs of 2500kVA each (N=4). To provide resilience to at least N+1 to meet HTM 06-01 requirements, will require 5 no. generator modules to be installed.

For the dual unified primary and secondary distribution system proposed, standby generation capacity should be divided equally between both sides of the system. This is achieved by adding an additional generator module (see drawing: SK-050). The advantage of this is that, whilst overall generation capacity and redundancy is provided to N+2, N+1 system redundancy is maintained in the event of the failure of one module or routine maintenance being carried out at the time of supply failure by the DNO. This is particularly important since the DNO is only able to provide a dual incomer from the same source substation at Braehead.

Generator size is 2500kVA (continuous rating) 3225kVA (standby rating). The proposed generator ratings will provide in excess of 9.6MVA of standby rating sufficient to supply the facility from one side of the dual unified distribution system.

Since the DNO may not be able to provide two separate 33kV supplies from separate supplies, it appears that additional resilience to N+2 should be allowed for at this stage in the design. This enables maintenance work to be carried out on one generator module whilst still preserving N+1 resilience.

Standby diesel generation using 2500kVA continuous rating machines generating at 11kV.

There should be a review of options as to whether the prime mover should be naturally aspirated or turbo charged diesel engines. Naturally aspirated engines are likely to be larger than turbo charged units of the same power rating and are better able to accept larger load steps as a result.

Fuel storage should be provided for at least 200 hours running at full load. Fuel consumption of diesel engine generator sets is approximately 0.22 litres/kVA/hour. For 4 no. 2500kVA engines running at full load for 200 hours, this requires 440,000 litres of fuel. Add the 15% margin and storage for 500 cubic meters of diesel fuel will be required

Generators should be installed to meet the Category 2 or 3 requirements of BS5514 or ISO 3046.

Dual fuel diesel engines which can run on either natural gas or diesel fuel have been around for a number of years. Consequently, it may be possible to combine the function of one of the standby generation modules as a Combined Heat and Power (CHP) module.

The generator modules must operate with their electrical output synchronised together and should be designed to be synchronised to operate in parallel with the public electricity supply (PES) in accordance with the requirements of Energy Networks Association publication G59. This may have commercial advantages for providing embedded generation capacity during periods of high demand (i.e. 'peak lopping').

In the event of failure of the incoming PES, all the standby generators are to start and run up to speed. Generator outputs are synchronised together and then switch onto the load. The load is shared across all generators. If load and conditions permit, it may be possible to shut down redundant sets. Redundant sets are to be restarted in the event of high electrical demand.

The proposed secondary power supply system (SPS) is to be capable of 100% cover.

The time delay between loss of normal supply and connection of the standby generators to the essential load shall not exceed 15 seconds. The Building Management System (BMS) will be configured to hold off plant load temporarily to allow the generating sets to take their initial load. Allowable 'hold off times' for different services and areas of clinical risk are indicated on schedule V[20]-500.

Standby generation modules, plant and associated equipment will be located together in the 'Energy Centre' compound along with the boiler plant and CHP modules.

Standby Generation Switchgear

Each standby generation module will be provided with an impedance earthing transformer and the outputs will be connected to a withdrawable pattern 11kV switchboard. This switchboard will have two connections into the primary main intake switchboard for resilience (see drawing: SK-050). Each set will be provided with normal set protection together with a multi-function meter, earth fault and over current protection.

Combined Heat & Power

Up to two combined heat and power (CHP) modules are proposed with an electrical generation capacity of 1.5 MVA each. They will generate electricity at 11kV and will be housed along side the standby generators and boiler plant in the Energy Centre compound. The economic case for the extent of the CHP has yet to be firmly established.

The CHP units will require synchronising equipment and controls to enable them to parallel with each other and the DNO supply.

Due to the differences in capacities between the CHP modules and the standby generation sets it is not envisaged that they will operate in parallel. Consequently, in the event of a failure of the incoming DNO supply, the CHP modules will shut down. Each CHP module will be provided with normal set protection together with a multi-function meter, earth fault and over current protection. Like the standby generation modules, the CHP modules will be provided with synchronising equipment to allow parallel operation with the mains supply.

Paralleling the CHP modules with the standby generators in the event of incoming (DNO) supply failure may be possible by the appropriate selection of plant. It may then be possible to reduce the number of standby sets or increase resilience.

*Monitoring & Control*

A SCADA (Site Control And Data Acquisition) system will be required to monitor loads across the site at all times. The control system will manage the loads and carry out load shedding so that when the generators start key loads (e.g. chiller plant) stay off until the generators have accepted higher priority loads. The SCADA system will also control the standby generators.

LV Distribution

LV switchgear

All wiring systems will be of a form defined within BS 7671:2001 (Wiring Regulations 16th Edition IEE). The 17th Edition of the Wiring Regulations is currently being drafted and is expected to be released in January 2008. Expected revisions will include new requirements for Medical Locations.

A mixture of single phase and three phase will be supplied

- Form 4 Type 2 for Clinical Risk Categories 1 & 2
- Form 4 Type 6 for Clinical Risk Categories 3, 4 & 5

Main LV switchgear will comprise of metal cubicle pattern switchgear enclosures containing Air Circuit Breakers (ABC) and Moulded Case Circuit Breakers (MCCB).

For both the RHSC and the Adult Acute hospitals, most of the areas fall into Clinical Risk Categories 3,4 & 5 for the provision of robust electrical supplies serving:

- general lighting
- standby lighting
- general power
- medical power
- medical IPS power
- mechanical services plant (ventilation, medical gases, water, chilled water etc)

The new HTM-06-01 (clause 4.22) suggests that patients in Clinical Risk Category 4 locations relate to patient environment group 1 under Chapter 10 in 'IEE Guidance Note 7', which includes bedrooms. The tower of the Adult Acute hospital contains general ward areas. It has been assumed that these areas will require building services appropriate to Clinical Risk Category 3.
Due to the adjacencies, dual transformers and switch panels will be provided to form part of the dual-unified supply philosophy employed in the distribution design. Like the MV distribution, the LV distribution is to be divided into Side A and Side B circuits. Side A and Side B Main LV switch panels adjacent to transformer substations and in separate will be linked together via a *`bus-coupler-bus-tie'* cable way and two ACBS as indicated on the schematic (see drawing SK-005). This is a robust arrangement, since a fault or problem on the Side A switch panel will not affect the Side B panel and vice versa.

Main LV switch rooms will generally be located at roof level on the tower, RHSC roof and adult acute podium roof. These locations should avoid being located beneath bulk liquid storage areas. Switchrooms are to be constructed from fire and blast resisting materials.

Distribution of LV power within the tower will be by 8 no. 630A three-phase bus bar trunking with equal size phase, neutral and earth conductors. Tap off units at each floor serve distribution boards for lighting and power. Each tap off unit will contain a circuit breaker to provide fault protection. Each rising bus bar pair serves each of the 'wings' of the tower. In accordance with the dual-unified distribution, each bus bar pair comprises of separate Side A and Side B busbars rising through the building in separate risers (see drawing: SK-010).

The design solution provides good resilience and allows the distribution equipment to be maintained with the minimum of disruption to services at ward and departmental level.

Final circuit distribution boards shall be Type A or B miniature circuit breaker (MCB) boards to BS EN 60439-3 located within risers or dedicated cupboards. All distribution boards are to be lockable with sheet metal doors to prevent unauthorised access. Distribution boards with plastic enclosures must not be used as they are known to be susceptible to EMC interference.

Cables & containment

Primary LV sub-main distribution is to be generally by multi-core XLPE/SWA/LSF (low smoke & fume) cables to BS6724 carried on ladder rack (larger cables) and/or cable basket (smaller cables). Primary LV cabling and containment is to be generally concealed within dedicated risers, cable trenches and risers throughout the building.

Side A and Side B cables and containment will be segregated and run by different routes to the final outlet as far as practicable. In practice, this is likely to mean that Side A and Side B final circuit cabling will run in separate containment up to bed head trunking units.

General Lighting

Artificial lighting is to be carefully designed to ensure that a pleasant and visually effective environment is achieved for staff and patients. As well as meeting the clinical requirements of staff, attention is to be paid the lit appearances of the spaces; this is important as anecdotal evidence suggests this can affect patients' recovery.
General lighting to all areas is to be by low energy fluorescent lamps. These consume considerably less energy than traditional incandescent lamps and provide adequate colour rendering. They are to be controlled by high frequency, high power factor (PF>0.95), low harmonic emission ballasts. Lamp and lighting gear monitoring is to be provided as a cost effective solution to lamp and gear maintenance.
Lighting levels are generally to be in accordance with CIBSE Lighting Guide 2 'Hospitals and Healthcare Buildings'. Lighting is to be designed to ensure that staff and patient areas are cheerful and visually interesting. This is to be achieved by ensuring adequate illumination of walls and ceilings, and by accent lighting used, for example, in waiting areas to complement the general lighting and perhaps used to illuminate paintings or plants.
The use of wall-mounted fittings in corridors and stairs is to be considered as these areas require neither high levels of horizontal illuminance nor uniformity, and wall-mounted fittings avoid light shining into the eyes of patients being wheeled on trolleys and bright reflected patches on polished floors.
In ward and bedroom areas lighting is to be installed to enable the ability to create different conditions depending on the time of day and what it happening. Ward and bedroom lighting is, for example, to incorporate night-lighting so that nurses can check patients at night. The installation of bedhead lights with a range of adjustable illuminances is to be considered so that they can be used for patient examination.
The table below summaries the lighting control strategy:

| Space Type | Lighting Control |
|---|---|
| day lit spaces (non-ward) | dimming controls and room photocells to provide dimming and off control |
| spaces subject to intermittent occupancy | occupancy detection to switch lights off when the room is not in use |
| all spaces | fitting dimming controls and room photocells to provide lamp output control as lamps age/fittings get dirty<br>lamp and gear monitoring and alarming for lamp/gear maintenance |
| external lighting | time and light level control of all external lighting |

Lighting circuits will be wired as radial circuits protected by 10A MCBs. Final lighting circuit cabling shall generally consist of LSF insulated single stranded copper core cables to BS7211 enclosed and protected within galvanised steel metal trunking and conduit. Plastic trunking will not be used because it does not provide adequate screening to meet EMC requirements and due to the high PVC content. All final circuits shall be provided with full size single core circuit protective conductors.

To satisfy HTM 06-01 recommendations, at least two lighting circuits will be provided to each room. One circuit will be fed from a Side A distribution board. The other circuit will be fed from a Side B distribution board. In the event of failure of either side A or Side B supply (but not both) at least half of the lighting will remain on.

Standby Lighting

Standby lighting will be provided as appropriate and will derive power from the Secondary Power Supply (SPS) or UPS, with UPS systems supported by the SPS.

BS7671 GN7 and IEC 60364-7-710 require light fittings used in Group 2 locations to have power supplies which restore power to the Standby Lighting within 0.5 seconds of a power supply failure. Essentially, these areas will require standby lighting to be supported by a UPS.

Standby lighting will be provided as follows:

- Grade A – to areas of Clinical Risk Category 5 (IEE GN7 Group 1 and 2 areas) provides lighting at the same level as normal lighting, power will be supplied by a UPS.
- Grade B – to areas of Clinical Risk Category 3 provides lighting at a reduced level compared to the normal lighting and power will be supplied from the SPS.

Group 1 Locations include:

- LDRP (labour, delivery, recovery, post-partum)
- endoscopy rooms
- A&E general/minors
- haemodialysis areas
- ECG, EEG, EHG rooms
- nuclear medicine
- radiography
- diagnostic
- MRI
- urology treatment areas
- examination/treatment/therapy rooms
- ultrasound
- bedrooms

Group 2 Locations include:

- anaesthetic room
- operating theatre
- operating prep room
- operating plaster room
- operating recovery room
- heart cauterisation room
- intensive care room
- angiographic examination room
- premature baby rooms

Grade A standby lighting will be provided from Central UPS inverters and storage battery systems to provide an interruption time of less than 0.5secs (16.77) to Group 2 locations (see drawing: V[20]-500). Inverter systems will be installed with N+1 resilience and supplied with dual power supplies from Side A and Side B sources and capable of up to 3 hours autonomous operation.

These UPS systems will be either Rotary or Static UPS systems.

LV Small Power/Final Circuit distribution

Final circuit cabling shall generally consist of LSF insulated single core cables to BS7211 enclosed and protected within metal trunking and metal conduit. Plastic trunking will not be used because it does not provide adequate screening to meet EMC requirements and due to its high PVC content. All final circuits shall be provided with full size single core circuit protective conductors.

All electrical accessories such as socket outlet switchplates, shall be of stainless steel finish in Clinical Risk Category 3, 4 and 5 areas. Metal finishes are required to limit the effect of electromagnetic interference and increase mechanical protection. Offices and administration (non-patient) areas could be of alternative materials (i.e. white plastic), but metal finished outlets are more robust.

Small power to socket outlets in general ward areas to serve bed motors, cleaners sockets etc are to be segregated from other power outlets.

Small power to socket outlets in bedhead units in wards will be supported by the secondary power supply system with socket outlets distributed over at least two (Side A and Side B) interleaved circuits. In the event of a failure on Side A (final circuit, rising busbar, distribution board, main switch panel or supply transformer) then power will still be available from socket outlets connected to Side B circuits. Side A and Side B power will be available to socket outlets from the Secondary Power Supply (SPS) within 15s in accordance with HTM 06-01. Final circuit cabling will share the same containment within bed head trunking. Appropriate dividers should be used within bed head trunking to provide separation between Side A and Side B cabling.

Socket outlets connected to the SPS will be labelled ‘Side A’ or ‘Side B’. Staff will need to be trained/educated so that they understand what this means as the more traditional ‘essential’ and ‘non-essential’ terminology will not apply.

Uninterruptible Power Supplies (UPS)

The provision made for interruptible/ uninterruptible power supply (IPS/UPS) solutions to provide electrical safety in the patient environment has been based on IEC 6034 for Electrical Installations in Medical Locations, HTM-06-01 and the recommendations of Guidance Note 7 to BS7671 Wiring Regulations published by the Institution of Electrical Engineers.

UPS solutions are provide to support Grade A standby lighting in Group 1 and Group 2 locations within areas of clinical risk 4 and 5.

UPS solutions are provided to support IPS and Group 2 locations within areas of clinical risk 5 with 3 hour autonomy.

UPS solutions are to be provided for each of the principal IT server rooms with N+1 redundancy.

Automatic Controls

The whole of the mechanical and electrical services installation will be supported by an automatic building management system that will perform the following functions:

- Control the plant in a safe manner
- Control and monitor the internal environmental conditions to reflect user requirements
- Control and monitor building and system energy usage.
- Fault find
- Act as a maintenance asset

The building management system shall consist of distributed intelligent out stations connected to a head end computer with full graphical interface. Real time and database data shall be available across the Hospital IP Ethernet network.

6.3.15 Nurse Call and Critical Care Systems

A nurse call system is to be part of every bedhead service. A patient hand unit with a call button is to link to an indicator panel at the ward nurses station. The system is also to link to call buttons in other areas such as WC’s, bathrooms and quiet rooms. The exact requirements of the system are to be confirmed with the Trust, however it is assumed that the system will include the following facilities:

- over-door indicator lights
- ability to link calls between adjacent wards
- cardiac arrest or ‘crash’ call alarms taken back to a 24 hour manned point to allow the ‘crash’ team to be paged

6.3.16 Patient Entertainment Systems

Backbone broadband cabling and wireways are provided for a patient entertainment system, such a Patientline, to be installed at all bed heads in the Adult Hospital. This can provide television, radio, and telephone, game and internet services to patients as required, who can be charged on a pre-payment basis.

Since NHS licensing terms prevent service providers from charging children for television services, there is no commercial incentive for private companies to install patient entertainment systems in the Children’s Hospital. We are assuming, therefore, that entertainment systems will be provided as a capital item in the Children’s Hospital. It is likely that the system will be restricted to television, radio and games services only.

In addition to facilities at each bed head, it is assumed that in the Children’s Hospital, entertainment systems consisting of TV, DVD and games systems will be provided in the main waiting and play areas. These will require a central TV and radio reception and distribution system.

6.3.17 Fire Detection and Alarm

The Hospitals are to be fitted with automatic fire detection and alarm systems in accordance with BS 5839 and the recently published HTM 05 series of memoranda.

The systems are to be designed to BS 3829 category L1, the highest level of life protection, and are to be analogue addressable. Progressive horizontal evacuation in patient areas is to be facilitated by each fire resisting sub-compartment being on a separate alarm zone, and by the use of two stage (evacuate/ alert) alarms. To avoid unnecessary disturbance, staff elsewhere in the building who are required to perform particular tasks in the event of a fire are to be automatically alerted by pagers to avoid the sounding of the fire alarm.

In areas where patients can escape unaided and in non-patient areas the audibility of the fire alarm should be in accordance with BS 5839. However, in other areas an audible alarm may be unacceptable and the use of visual devices is to be considered in areas such as very high dependency patient areas, these include operating theatres, ITU and special care baby units.

Control panels are to be provided at the main entrances (or at the entrances to which the fire service are to attend, if different), with additional indicator panels provided throughout the building to allow staff to respond in accordance with local evacuation procedures, and to guide the fire service to the source of the alarm.

There is to be a link to the control room, from where the fire service can be summoned. If this is not to be manned on a 24 hours basis, then the fire alarm signal is to be transmitted automatically to an alarm receiving centre via a monitored line.
The fire alarm system is to contain links to all necessary ancillary services such as automatic door releases and door control systems, access control systems, ventilation systems, lifts etc..

6.3.18 Security Systems

Access Control & Intruder Alarm Systems
Access control is to be provided to all wards and departments to prevent unauthorised access. Control will be via a swipe or proximity card system. Some departmental systems may only be activated outside normal working hours if this is desirable. The system is to be networked with the central management system and linked with other systems to allow:

- the unlocking of doors along all escape routes to assist evacuation in an emergency
- possible automatic locking of doors within an area if a panic button is pressed
- activation of a security camera in a particular location when a door is opened to provide a picture of the person entering

The A&E entrance is to have an access control system for use at night time so that security staff can control entry, in accordance with the Secured by Design recommendations.

The following areas are to be fitted with local intruder alarm systems:

- pharmacies (to prevent the theft of controlled drugs)
- X-ray department areas used for storing silver chemicals
- patient record offices
- mortuary

The intruder alarm systems are to link centrally back to the control room.

6.3.19 CCTV

CCTV cameras are to be installed in the main entrances, waiting and circulation areas of both hospitals where the security and safety of hospital staff and patients is a concern but where free access for the visiting public is allowed.

The CCTV systems are also to cover:

- all exits and entrances
- pharmacy counters
- ward entrances
- Children's play areas
- ambulance entry points
- A&E departments

All CCTV cameras will be IP-based. They will be linked back to local hubs by Cat.6 cabling. Local data hubs will be connected back to a number of CCTV servers adjacent to electrical risers, which will in turn be linked to the main server room via a looped optical fibre network. CCTV servers will include input modules, processors and RAID storage. Each CCTV server will also be provided with an independent broadband connection to provide connectivity in the event of a network failure.

All cameras will be linked back to the control room.

The CCTV system will be linked to the intruder alarm and access control systems to provide specific viewing functions, such as presenting a picture on a monitor when an access card is presented to a reader, or when a movement detector activates.

Paging, Personal Attack Alarms & Panic Buttons

The Hospitals are to be installed with a radio-frequency network to facilitate the use of paging and personal attack alarms. This radio-frequency network is to include location beacons so that the location of pagers and attack alarm devices can be determined.

The radio-frequency network infrastructure is to be compatible with the Identicom personal security device, which is used widely across the NHS to provide lone-worker protection.

Panic buttons linked back to the control room, and with a loud alarm at the scene, are to be installed at reception desks and in treatment rooms.

6.3.20 Information Management and Technology

The NSGH and RHSC will be served by an N+1 server room distribution. The assumption is that these will be provided internally within the new development although there may be scope for incorporating the IT network to servers located within existing buildings on the site. The server rooms should have dedicated air conditioning, fire suppression and UPS systems to maintain resilience in the IT network.

Within these principal IT rooms, decentralised telephony servers will be provided, again to provide a level of resilience.

The initial design proposal comprises of 42 data hubs (31 for NSGH and 11 for RHSC) each to accommodate two racks allowing sufficient space for network expansion. Ideally these will be located next to electrical/data risers on each level and also placed to ensure CAT6 cable runs do not exceed 80m. The rooms should be able to accommodate hardware for CCTV, security, access and pager systems. Data risers should also be of sufficient size to accommodate network expansion or modification.

It is envisaged that the Trust will be using wireless technology for public and some staff data connections and voice over IP for telephony. However, for resilience, hard flood structured wiring points will be provided throughout all areas of the hospital as the base provision.

6.3.21 Specialist Systems (Medical Gases/ Pneumatic Tube)

Medical Gas Pipeline System

The medical gas pipeline system for the site will require a detailed design package from a specialist consultant. Co-ordination with existing gas supplies on-site throughout the phasing period could provide some economic benefits but the new developments will require new independent external plant and a complete medical gas pipeline system.

The primary gases and pipeline services are as follows:

Oxygen ($O_2$)
Medical Air (400kPa)
Surgical Air (700kPa)
Other gases ($N_2O$, $O_2/N_2O$, $HeO_2$ and $CO_2$)
Medical Vacuum Systems (VAC)
Anaesthetic Gas Scavenging (AGS)
All these systems are shown on the outline schematic, derived from HTM 02-01.

Oxygen
A ring main will surround the site (NSGH & RHSC) feeding all necessary areas. It will be supplied from primary, secondary and tertiary sources. Primary and secondary supplies will be two liquid oxygen VIE tanks on a single plinth in an external compound. It will require an 8m boundary zone for most activities around the enclosure, going up to 15m for places of assembly and flanges in flammable gas pipes. Allowance should be made for regular large vehicle access for tank refilling.

A tertiary source of supply (emergency supply) should be permanently connected to one of the main oxygen risers within the system or directly into a ring main system. This supply is to be a cylinder manifold consisting of 2 banks of 10 J type cylinders. Additional cylinder storage to feed the manifold should be provided in accordance with the results of the risk assessment. Final decisions on manifold capacity will depend on both available accommodation and potential risks to supply security.

All systems will be complete with full controls, monitoring and auto changeover equipment.

Medical Air
Provision of medical air would be best provided by a quadruplex medical air plant, comprising of 4 compressors, 4 dryers and 2 air receivers. It will be located in a plant room area with sufficient air flow for ventilation and cooling of compressors. Each compressor sized for 50% of the design flow – providing the primary and secondary supply. This ensures an N+1 operation allowing full design flow with one compressor out of service. Emergency provision should be an automatic manifold (2x10 J type cylinders) located within or close to the main building.

All supplies will conform to the European Pharmacopoeia standard for controlling air purity, all necessary filters and monitoring systems will be supplied. According to HTM 02, the efficiency of plant, expressed as the volume of air delivered to the pipeline distribution system, a minimum efficiency of 5 m3/kWh at 100% and 10% is required. The power consumption at zero flow should be less than 1% of that at 100% design flow.

Surgical Air

The size of the development warrants a dedicated surgical air supply. Surgical air will be provided by a simplex plant, 1 compressor and 1 dryer, located in a plant room area with sufficient air flow for ventilation and cooling of compressors. An emergency supply from an automatic reserve manifold (2x6 J type cylinders) will located in separate accommodation.

Manifold installations
Other gases required throughout the hospital will be supplied by an automatic manifold installation, as in the case of $N_2O$, with an emergency reserve supply connected. Gases used less frequently may be supplied by local cylinders at point of use.

Medical Vacuum Systems
The medical vacuum pipeline system provides suction for medical needs, particularly in surgical accommodation. Piped vacuum will be provided in most clinical areas by a triplex vacuum system, with 3 pumps and 2 vessels, located in a central plant room area. A third source of supply is not necessary with vacuum systems.

Anaesthetic Gas Scavenging (AGS)
Where nitrous oxide is provided for anaesthetic purposes, scavenging systems will be installed. This will be a vacuum system, independent of the main vacuum system located in a central plant room area.

Pipework
Pipework design and installation will conform to HTM 02, BS EN 737-3:2000 and ISO 7396-1:2002 standards. All piped medical gases will have three sources of supply.
Where practicable there should be 25mm spacing between each pipeline, 150mm spacing to other services (heating, steam ,water services) and if installed in the same riser, services must be accessible for inspection.

Service ducts or voids containing pipelines that include valves etc. should have adequate ventilation to prevent gas build-up in the event of any leakage. Elsewhere, where pipelines are brazed throughout their entire length (and where they will have been subjected to a pressure test), no ventilation is required.

Where pipelines in hazardous areas (plant rooms, kitchens etc.) are unavoidable, they should be enclosed in non-combustible, non-corrosive materials that have no electrolytic reaction with copper. This is to prevent the possibility of the liberation of gases into the room in the event of pipeline failure.

Accommodation

All gas supplies and plant should be located in safe, well ventilated areas in accordance with the recommendations set out in HTM 02.

Ready-to-use cylinder stores can be sited in various locations e.g. operating departments, Accident & Emergency departments, coronary care units, central delivery suites of maternity departments, special care baby units, critical care areas etc. These should be in a dedicated, easily accessible room, well ventilated and where practicable have at least one external wall for natural ventilation.

The main cylinder store should be at ground level (not basement), as close to the delivery point as possible and should have no restricted access (parking) where loading and unloading takes place.

Manifold rooms should be accessed from the open air, not from corridors or other rooms. Lorry access should be provided. Manifold rooms should not be located near high dependency wards.

Pipework will run to individual ward areas with individual valve isolation units and line pressure switches interlinked to individual ward medical gas panels.

Duplicate terminals, components and pipework systems should be provided in all areas considered to be life-support systems.

Medical gas Alarm Systems

Under HTM 02-01 guidelines, warning and alarm systems are required for all medical gas and vacuum systems. A simplified system is required for surgical air systems and for the AGS, with the warning/indication panel located in the operating room. The adoption of an integrated or combined integrated/dedicated alarm system should be considered providing it meets the requirements of HTM 02-01.

Pneumatic Tube System (PTS)

The scheme is to be provided with a complete pneumatic tube system. The initial proposal for the PTS is a 10 zone network to serve around 92 stations within the hospital, with 4 zones covering the ward tower itself. A dedicated zone between A&E and pathology is provided to maintain a high priority service, one of 3 dedicated systems between the network hub and specimen reception to maximise traffic handling capacity with automatic empty carrier return using transponder fitted carriers.

A more detailed design of the entire system can only take place when department layouts are finalised and traffic analysis can be carried out. At this stage a choice of system tube sizes can be made for each department (110mm or 160mm).

The system will be complete with all tubing, diverters, zone interchange unit, blowers, head end computer, transponder fitted carriers and all the other fittings and accessories necessary for a fully operational system. The system will be remotely accessible for diagnostics.

For a scheme of this size it is recommended that a full time on-site O&M engineer is present to ensure maximum service efficiency and provide training and auditing for the system.

6.3.22 Lift Strategy

Outline

Determining the number and size of lifts required for the NSGH and RSCH depends upon the information provided for the occupancy of the building's different areas and the rate at which they enter, move around or leave the building. The more detail that is known about movement of people (traffic) within the building, both horizontally and vertically, the more accurate the assessment will be. As the design progresses, the provision of lifts should be continually re-assessed to ensure the transportation needs of departments are met now and in the future. Lift shafts and circulation are difficult to subsequently modify during the PFI term or indeed over the life of the building and initial provision should take this into account. Future trending and a sensitivity analysis to change in use pattern should be carried out at the detail planning stage.

Modelling of lift systems has been carried out with methods defined in both CIBSE Guide D 'Transportation systems in Buildings' and HTM 2024 'Design considerations: Lifts'. Further design and traffic studies should be carried out with input from a specialist lift supplier.

Design Assumptions

Avanti Architects have sited the lift cores in order to keep patient/staff and visitor flows separated. Also the busiest areas of the hospital are on the first two floors to aid traffic flow and this reduces the need for multi-storey lifts which can increase both congestion and energy use.

Directions Consultancy provided preliminary details of staff, patient and visitor populations and movement predicted for both NSGH and the Children's hospital. (Peter Dunleavy 16/10/2006)

| Department | | Radiology | CCU | Theatres Endo | Emergency &Acute assessment | &OPD, Rehab, CIU, Cardio | Therapy, Renal, Wards |

| FM | | 5 | 5 | 5 | 5 | 10 | 20 |

*Table 2. RHSC populations for lift assessment*

Some of the values in the above tables were taken directly from the details provided by Directions whilst others were estimated from the available information. It should be made clear that in many departments the population is variable and often in transition from one department to another. The figures should be revised and adjusted as and when more detailed population and traffic flow figures become available.

Lift Cores

The cores are divided into three types: Bed, patients and staff, Public – Escorts/Visitors and FM – Facilities management staff. If the populations of the individual departments are known, from the layouts it can be estimated which lift cores are likely to be used, although there will always be some crossover e.g. staff using public lifts.

Traffic is due to people entering or leaving the building and also their movement within the building. The assumptions put forward by Directions have provided the basis of the model for example; staff arrival times, trips to theatre of ward patients per day, trips to radiology of ward patients per day, escort to patient percentages etc. Movement patterns throughout the day were divided into morning (7am – 12pm), afternoon (1pm – 5pm) and night (6pm – late). If a department covered more than one floor the population was divided roughly according to the floor areas shown on the layouts.

To determine what activity is present in a particular lift core a percentage of vertical traffic movement is given for each department and each time period. For example bed traffic to wards at night would be minimal with some admissions from A&E, therefore vertical movement for patients in wards is given to be 5% of the ward population.

Another consideration that has been incorporated into the model is the amount of crossover between cores, that is, staff using public lifts ~~or visitors using bed lifts etc~~. This factor can be different for different departments depending on the likelihood of crossover. As the busiest areas are located on the ground, first and second floor there is a factor for stair use. This is applied to the 1st floor (25%) and the 2nd floor (15%), after which it is assumed the lifts will be used, these factors are only applied to the able population e.g. staff, visitors or patients in outpatients.

Lift performance

The cores are then assigned to particular departments depending on their location. Core population can then be used to model the optimum number and size of lifts required taking into account lift core footprint, redundancy provision and quality of service.

The amount of population arriving or leaving the building within 15 minutes is used as the basis for determining the arrival rate at a particular lift. For example, HTM 2024 states that 'in an emergency situation, it should be possible to clear all visitors from the hospital in 15 minutes. The handling capacity of the lift system should meet this criterion'. Therefore the arrival rate at a public lift is based on 100% of core population leaving in 15 minutes. Guidelines for staff /patient handling capacity is given as an arrival rate of 8-11% for Hospitals in CIBSE guide D, which coincides with the core population arriving/leaving in 45 minutes i.e. 33% in 15 minutes.

Performance factor of a lift relates to the mechanical operation of the lift, such as time taken to start or stop moving, door opening times and lift speed. Lift characteristics have been taken from CIBSE guide D and HTM 2024 but detailed design will need specific manufacturers details for the chosen lift configuration including acceleration ($m/s^2$), jerk ($m/s^3$), advanced opening (s) and single floor flight time (s).

| Lift type | Location | Capacity | Rated speed (m/s) | Door open (s) | Door close (s) |
|---|---|---|---|---|---|
| Bed lift | Adult podium | 33 | 1 | 2.3 | 3.3 |
| | Adult tower | 33 | 2.5 | 2.3 | 3.3 |
| | Children's | 33 | 1 | 2.3 | 3.3 |
| Public lift | Adult podium | 10 | 1 | 1.9 | 2.8 |
| | Adult tower | 26 | 2.5 | 2.3 | 3.3 |
| | Children's | 10 | 1 | 1.9 | 2.8 |
| FM lift | Adult podium | 33 | 1 | 2.3 | 3.3 |
| | Adult tower | 33 | 2.5 | 2.3 | 3.3 |
| | Children's | 33 | 1 | 2.3 | 3.3 |

*Table 3. General lift specs for bed, public and FM lift cores*

The lift systems were assessed using the CIBSE D guidelines for offices as a basis for performance while meeting the requirements of HTM 2024 for visitor evacuation. Redundancy for maintenance or breakdowns was included in all lift cores to ensure there was an N+1 service of an acceptable standard.

The bed lifts accommodate both staff and patients, however patients in beds have different movement patterns and more space requirements. A CCU bed can take up approximately $3m^2$ while a standard bed around $2m^2$. The modelling revealed that bed lift provision should be in accordance with bed traffic, not staff traffic. Therefore the results were based on every lift journey during the peak interval carrying one bed with one or two accompanying staff.

Escape Lifts

All bed lifts are to be designed to function as escape lifts.

Although the Department of Health's Fire code does not deem the provision of escape lifts necessary, it does state that to better facilitate evacuation, consideration should be given to the provision of such lifts.
The Scottish Executive's recent Fire Safety Policy for NHS Scotland (HDL 2005 53) states that the development of fire strategies must take account of requirements of the DDA. As such it states that 'the use of escape bed lifts may need to be given a higher priority to ensure that people who are only able to access the premises via a lift can also evacuate in the same manner'.
The installation of escape lifts will provide the following benefits:

- ensure compliance with the DDA and assist the evacuation of patients unable to use stairs,
- make full use of all egress capacity and thereby complete the evacuation process more quickly,
- help make stairways more available to fire-fighters,
- avoid burdensome descents using stairs from the upper stories, especially from the Adult Hospital ward tower.

The electrical supplies, communications and lift-care control systems for the fire-fighting lifts are to be installed in accordance with BS5588-5 and HTM 05-2.

Fire-Fighting Lifts

The two sets of public/escort lifts that serve the Adult Hospital ward tower are to function as fire-fighting lifts in the event of a fire. HTM 05-02 requires fire-fighting lifts in hospitals with five or more storeys, and states that a minimum of two should be installed.

The lifts are to be installed in accordance with BS5588-5.

In the next design development stage, the installation of escape and fire-fighting lifts will be reviewed as part of the fire strategy with the Fire Engineer, Trust's Fire Safety Adviser and the local fire and rescue services.

6.3.23 Helicopter Landing Sites (HLS)

The New South Glasgow Hospital will require a helicopter landing site to receive emergency patients from a wide area of Scotland. The existing ground level landing site will have to be relocated during and after construction of the hospital. To overcome site restrictions to flight paths and helicopter approach, the provision of a rooftop heliport has been put forward as the preferred solution.

The elevated heliport must be able to accommodate both light utility helicopters e.g. Eurocopter EC135 and heavier support helicopters; for design purposes, we have based our assumptions on the Sikorsky S61 Seaking used in the UK for Search And Rescue (SAR).

Rooftop based heliports

The only existing hospital based rooftop helipads in the UK are on the Royal London, Whitechapel and LGI, Leeds both of which are for class 1 helicopters only.

The UK Civil Aviation Authority (CAA) knows of no UK rooftop pad that would accommodate a Seaking or similar SAR helicopter. Any rooftop HLS designed would have to be in accordance with standards set by the CAA and the International Civil Aviation Organisation (ICAO) following published guidelines including 'The Heliport Manual' doc 9261 and CAP 437 'Offshore Helicopter landing areas'

STRUCTURAL REQUIREMENTS

The ICAO 'Heliport Manual' guidelines state that for elevated heliports the structure must be able to support the largest or heaviest type of helicopter anticipated for use. The dynamic load due to impact on touchdown for normal and emergency landings is as follows:

For an S61N (Class 2) helicopter:

Dynamic load due to touchdown 23,157 kg

For an EC135 (Class 1) helicopter:

Dynamic load due to touchdown 7,246 kg

Guidelines are given by the ICAO 'Heliport Manual' for other all structural loading requirements including sympathetic response factor, superimposed load, lateral load, dead load, wind loads and punching shear check.

LANDING AREAS

The minimum areas required for a helicopter landing site, rooftop or ground level, capable of accommodating Sikorsky S61N

Seaking and Eurocopter EC135 helicopters would be as follows:

For an S61N (Class 2) helicopter :
Overall diameter including Flight Approach & Take Off area and safety area 39m

For an EC135 (Class 1) helicopter :
Overall diameter including Flight Approach & Take Off area and safety area 21.3m

Items such as air vents or lift housings present a hazard to the helicopter and also cause turbulence, therefore these should be located below the level of the FATO. Elevated heliports on hospitals for emergency use should have an access ramp from the safety area to the lift, for transporting patients.

LIGHTING

A hospital based HLS would require lighting as per the 'Heliport Manual' although it does not specify whether this should be fed from the mains, emergency or other power supply. The design of markings and lighting aids are specified in the 'Heliport manual'

FIRE FIGHTING & DRAINAGE

In the case of an elevated heliport, no specific response time is recommended as it is considered that the fire fighting and rescue service will be available or in the immediate vicinity of the heliport while helicopter operations are taking place.
Guidance is given in the 'Heliport Manual' on the supply and equipment that needs to be provided on an elevated heliport. The water requirement can be supplied either by tank storage or pressurised water main.
The drainage requirements of the helipad will need to be designed to cope with rainwater and the emergency drainage of fire fighting water, foam and any fuel spillage from the helicopter.

For an S61N (Class 2) helicopter the quantities and estimated flows are as follows:

Minimum usable amount of water 5000 litres

Discharge rate of foam solution 500 litres/minute (over 10 minutes)

Estimated max flow of emergency drainage required over 10 min period 10.92 litres/second

For an EC135 (Class 1) helicopter the quantities and estimated flows are as follows:

Minimum usable amount of water 2500 litres

Discharge rate of foam solution 250 litres/minute (over 10 minutes)

Estimated max flow of emergency drainage required over 10 min period 5.33 litres/second

Additional flow would occur from rainwater and all drainage would require treatment / separation systems to account for possible aviation fuel and fire fighting foam solutions.

RE-FUELLING

Although, on offshore sites, re-fuelling capabilities are standard, it is much less common for onshore sites, especially rooftop HLS. The Royal London HLS has no fuel storage as it was deemed an unnecessary risk to the building and it's inhabitants. The HCA advised that it would be unlikely that the Southern General Hospital site in Glasgow would require refuelling facilities either ground or rooftop mounted. The lighter Eurocopters used by the Scottish Air Ambulance currently have their main base with refuelling facilities at the SECC (4 miles) and the Search and Rescue helicopters used by the Royal Navy are based next to Prestwick Airport (31 miles) but have the option of refuelling at Glasgow Airport (5 miles) if required.

6.3.24 Sprinklers/ Fire Mains

SPRINKLERS/FIRE MAINS

Sprinklers are to be installed throughout the very high dependency patient access areas of the hospitals (Critical Care & Operating Theatres) and adjacent areas below and/or above where there is a fire risk other than low. This is part of the life safety strategy to minimise the probability and maximise the time available prior to the evacuation of very high dependency patients in the event of a fire or fire alarm.

Sprinklers installed in patient access areas of the hospitals are to have quick-response heads. To reduce the risk of false sprinkler discharge in patient treatment and bed areas where venerable patients may be affected or distressed by such an occurrence, the sprinklers heads are to be controlled as part of a “double knock” reaction system. The dry section to be pressurised with air or nitrogen with water control valves interlinked and controlled by the automatic fire detection system.

The general hazard classification of the Hospital is to be Ordinary Hazard OH1 to BS EN 12845. However, areas of higher risk such as kitchens and storage rooms with a high combustible load are to be Ordinary Hazard class OH3.

Each sprinkler system in the Children and Adult Hospitals is to be served by two independent storage tanks/fire pump sets located within the basement of the Children’s Hospital, each tank fed from two independent water supplies. The capacity of the tanks and pump arrangements are to be in accordance with BS EN 12845.

Every part of every storey is no more than 60m from a fire outlet connection, measured along a route that is suitable for laying hose. On the lower floors all hospital streets are to have wet rising mains located at department entrances. On ward floors wet risers are to be located in protected stairways. Fire mains are to be designed and installed in accordance with BS 9990:2006.

Basement storage and commercial areas are likely to require sprinkler protection as part of the smoke control strategies.

Further Work at the next Work Stage

The need for sprinkler protection to Wards generally or some or individual Wards to provide protection to dependant patients needs to be investigated with the client by risk assessment.
This work needs to be integrated into the overall building emergency and fire safety strategy and evacuation management assessment to be developed with the client.
The cost benefit of providing sprinkler throughout the hospital needs to be established

6.3.25 Future Adaptability, Flexibility and Expansion

Energy Supply

It is likely that the source of fuel for space and water heating will change during the PFI period or within the life of the building. Biogas, synthetic natural gas or bio diesel are future possibilities as is hydrogen gas.

Solid palletised biomass is probably less suitable as the delivery, space and cost of bulk fuel handling on site make it difficult to achieve for a city centre site where space is at a premium and transport is difficult. The river does, however, provide a future opportunity. It is likely that liquid bio fuel will be used predominately as a transport fuel rather than building fuel as it’s high energy density (volume and mass) can achieve the high premium required for this application.

On site generation of electricity by burning fuel and turbine/engine/fuel cell technology may become more important particularly if the hospital can be interconnected to the remainder of the site or other buildings with good year round heat loads adjacent to the site, eg residential, swimming pool/leisure centre or an industrial process. Fuel cell technology involves few moving parts and so is likely to be robust and resilient.

Community heat supply is likely to become available to the site as community heat and power schemes are developed based on waste recycling and the like. The hospital will be an attractive load with it’s good year round load.

A central energy centre with centralised boilers and electrical supply provides a distribution infrastructure which is adaptable to these future technologies and opportunities. The fuel source can be changed relatively easily as new technology becomes resilient and economic.

On site renewables may be applied driven either by better commercial cost or by regulation. The building roof areas and facades are available for retrofitting with PV electric generation.

Changing Demand on Building Infrastructure

The clinical areas of the hospital are likely to change more quickly and more radically as models of care are developed and technology development advances treatment methods and scope.

Electrical supply, cooling capacity and ventilation needs are the servicing infrastructure that is most likely to need to respond to these changes.

For the clinical areas the main distribution system between central plant/supply points to local connection points should be designed with +100% overcapacity to allow for loads to be relocated over the floor plate and additional load added.

For non clinical areas +20% should be used.

Central plant and supply space planning and system planning should anticipate up to +20% additional capacity being added over the life of the system.

Changing Spatial Requirements

The hospital services infrastructure is to be distributed in a well structured way, based on risers in vertical transport areas, adjacent to lift and stair cores. This should minimise any disruption due to the internal reconfiguration of hospital departments.

SUSTAINABILITY

Technical and engineering performance requirements for the structural elements of the building will limit the range of options available with regard to sustainability criteria, but in the selection of the system adopted, consideration should be given to material sourcing, use of recycled materials, waste minimisation, off-site prefabrication such as to maximize available sustainability elements. Design activities should be such as to minimize unnecessary standardisation where this adversely or significantly influences component sizes or introduces excessive redundancy. All design elements and systems should be optimised at the design phase as this can provide major sustainability benefits.

For the proposed building elements of the facility comprising podium, tower and lab block, the structural framing alternatives are structural steel, in-situ reinforced concrete and pre-cast concrete, supported on reinforced concrete or steel piles to bed-rock. A detailed comparison should be made to compare the embodied energy and equivalent $CO_2$ emissions for the system adopted versus the advantages of thermal mass with consequent benefits and overall energy use over an agreed period. This will require to be undertaken within the context of other site constraints as well as technical, cost and programme parameters.

Foundation systems, comprising piles into rock-head, pile caps and ground beams can be formed from reinforced in-situ or pre-cast concrete or from structural steel pile sections. A detailed assessment should be undertaken of relative embodied energy requirements or CO2 emissions with regard to sustainability. However it is considered likely that technical, durability and logistical constraints will dictate the form of the foundation system. The disruptive affects of the installation of these should be due consideration given the ongoing activity at the Southern General Hospital.

Structural floors can be formed in a number of ways to meet required load capacity, serviceability and dynamic response requirements for all the varied requirements of the hospital. This will include wards, theatres, plant rooms, radiography etc. Alternatives that should be considered include solid in-situ slabs, pre-cast units, shallow–floor construction and a range of other proprietary floor systems. A detailed comparison should be made to compare the embodied energy and equivalent $CO_2$ emissions for the system adopted versus the benefits of thermal mass properties on the services strategy over a 60 year period. This will require to be undertaken within the context of other site constraints as well as technical, cost and programme parameters.
Options Considered

The economic case for sustainable low energy solutions will change over time driven by global availability of fuel and tightening governmental legislation and social responsibility to reduce pollution and climate change. There will be an increase in the use of renewable energy in preference to expensive fossil fuels.

The technology and understanding to realise significant reductions in carbon emissions, such as the 60% target reduction by 2050 as proposed by the UK Government, is progressing. Many of the measures required to meet such targets will need to be introduced into the building and PFI contract over the life of the PFI and subsequently the building.

We have taken the view that the Design Solution should at least meet the current NHS and Building Regulation standards with regard to energy use current at the time the buildings are built or that are economically and technically viable to include. The emphasis should be on investment in the highest quality building fabric and envelope design to reduce the demand for energy to the lowest economically possible level as these have in general the lowest technical risk associated with them and are often

the least easy to substantially change over the building life. The energy systems within the buildings have a much shorter life, are easier to adapt and will be regularly replaced and upgraded over time based o there own life cycle and the changing technical, economic, regulatory and social pressures at the time of replacement. The building infrastructure does however need to facilitate as far as is possible the likely changes that will be made.

We include the results of the PFI hospitals energy strategy review held in March 2007

6.3.26 Energy Targets

NHS GUIDELINES

Energy use should be within range of 35-55GJpa per 100cm
For this Acute Hospital we propose a target of 55GJpa per 100cm

SCOTTISH BUILDING REGULATIONS

Draft Section 6 for implementation May 2007
23% to 28% improvement on current Building Regulations measured as carbon emissions

- Currently no requirement for on site renewable energy but may come through the Glasgow planning system as London & Edinburgh.
- Often energy in use exceeds the design targets.

EXPERIENCE FROM COMPLETED BUILDINGS

3 Key Areas for a Strategy

- Good Building Design to provide
  Good thermal insulation, air tightness and solar protection
  Exposed Thermal mass where appropriate
  Good quality ventilation control and efficiency window design is critical
  Use Of Natural Daylight
  Use of Natural Ventilation where appropriate
  Smarter system controls intuitive use and system monitoring
  Avoiding Over Complex Solutions
- Good Building Services Commissioning
- Good Building Services User Understanding and User Operation

PFI puts responsibility for these with a single party
The incentives and penalties for the PFI to deliver or better energy targets must be strong enough

NSGH PROPOSED ENERGY STRATEGY

- INVEST IN BEST BUILDING FABRIC

  Robust
  Best value and lowest lifecycle cost
  Creates a Good building environment
- ENERGY EFFICIENCY & RENEWABLES
  Based on financial merits but minimum to meet energy & $CO_2$ emission reduction guidelines and renewables obligations (if any)
- ADAPTABLE
  Engineering services need to adaptable to new technologies and a changing fuel supply and economic circumstances/regulations

BASE SCHEME;

- Mechanical or natural ventilation to perimeter wards & day lit office/staff/public accommodation
- Mechanical Ventilation with peak summer cooling to clinical and core areas
- Air conditioning to critical care clinical areas

- Gas Fired MTHW boiler plant with light oil standby within an energy centre
- Mains HV electrical supply with HV/LV distribution and LV diesel standby generation

DESIGN ENHANCEMENTS THAT HAVE A GOOD LIFECYCLE COST AND INCLUDED AT ADDITIONAL CAPITAL COST WITHIN THE DESIGN SOLUTION

| | |
|---|---|
| Building Fabric | thermal performance:<br><br>20% improvement on current Scottish Building Regulations<br>air tight construction better than 5cm/hr at 50Pa |
| Mechanical Ventilation | heat recovery ventilation on fresh air plant; effic > 70% annual<br>variable demand fan speed control by vvvf inverter |
| Boiler Plant | Flue gas economisers on lead natural gas boilers<br>MTHW distribution variable flow arranged for low return water temperatures<br>Digital variable load pressure jet burners with oxygen trim control and excess air control/shut off when boiler off line<br>Boiler firing optimisation. |

DESIGN ENHANCEMENTS THAT HAVE A GOOD LIFECYCLE COST

| | |
|---|---|
| Heating Distribution | Variable demand pump speed control by vvvf inverter and 2 port valve control |
| H&V Control Zoning | Heating control compensator zoning with local room control, zoning between day & 24hour areas |
| Hot Water | Combined Heat & Power (CHP) plant to provide base hot water load |
| Water | Leak detection monitoring<br>Water use reduction technologies (dual flush WC, PIR tap control) |
| Cooling Plant | Variable demand condenser fan speed control and flow & head temperature optimisation<br>Variable demand pump speed control by vvvf inverter and 2 port valve control<br>Use of free cooling roof mounted chillers for ITC equipment cooling |

DESIGN ENHANCEMENTS THAT HAVE A GOOD LIFE CYCLE COST

| | |
|---|---|
| Lighting | High frequency dimmable ballasts with occupancy and daylight linking where appropriate; lamp light output control and lamp monitoring.<br>Appropriate and adjustable artificial lighting levels |
| Lifts | Traction lifts with lift management group controls and regenerative breaking |
| Energy Management | Sub metering and logging to allow system by system and area by areas energy monitoring and energy targeting (heat, coolth, water, gas, power) |
| Load Topping | Ability to run standby generation plant in parallel to the electrical supply grid to allow load to topping according to tariff. Economic case not proven at this stage |

ONSITE LOW OR ZERO CARBON TECHNOLOGIES

| | |
|---|---|
| CHP | Generating heat & power on site is energy efficient in that the heat that would otherwise be thrown away at a thermal power station can be used to heat hot water for the hospital.<br>This has a good economic case and should be included. Initial estimates indicate a cost neutral payback of between 8 to 10 years.<br>Extent of provision, subject to detailed economic assessment |
| Ground Coupling | The ground temperature is a constant 12ºC throughout the year. If peak summer comfort cooling is required to areas of the building it can be a low cost and energy efficient system as an alternative to central chilling (eg Ward Ventilation precooling, public area comfort cooling).<br>There is the opportunity to store heat within the ground between winter and summer to heat and cool the building. To will need to be investigated |

ONSITE LOW OR ZERO CARBON TECHNOLOGIES considered but not adopted at this time

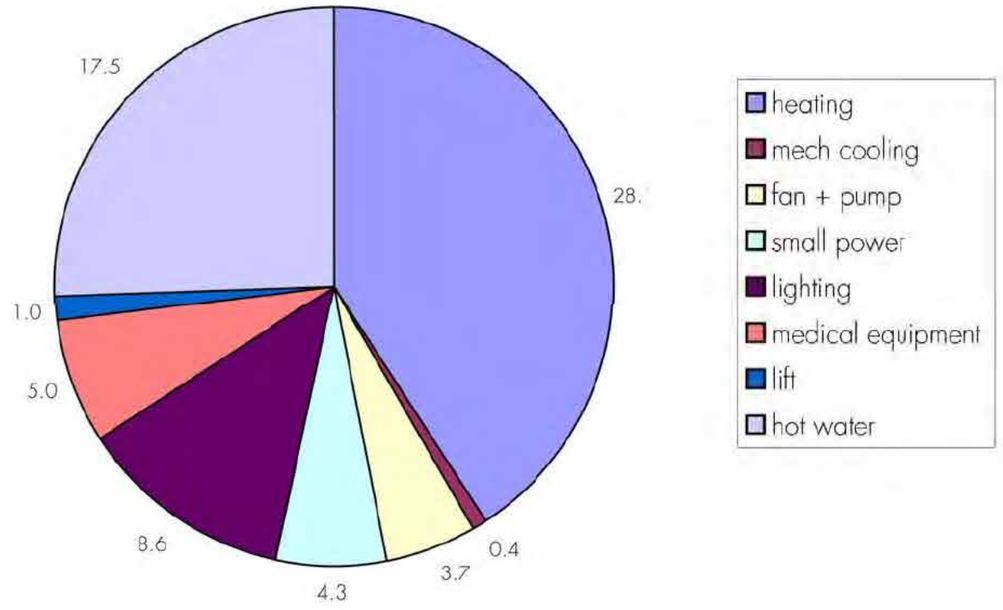
| | |
|---|---|
| Absorption Chilling | The use of heat from CHP to provide base load cooling has been discounted as the technology relies on heat rejection through roof mounted cooling towers which are seen to pose an unacceptable risk to the PFI and NHS in terms of maintenance/operation. |
| Wind Energy | The site is not suitable for large wind turbines commensurate with the scale of the hospital development. Wind turbines are best placed where it is windy but this needs to be balanced against the cost and inefficiency of energy transmission over long distances. The Clyde river bank offers a potentially suitable site close to the hospital, away from noise and flicker sensitive areas and with good wind availability. We have prepared an outline of a possible scheme to explore the possibilities for the realisation of such a proposal (outside the PF remit) |

ONSITE LOW OR ZERO CARBON TECHNOLOGIES

| | |
|---|---|
| Solar Thermal | Economic and technically feasible but competes with CHP and therefore not included. |
| Solar Electrical | Currently not economically feasible. Capital is best used elsewhere on alternative measures or technologies such as energy demand reduction and is therefore not included. |
| Bio Fuels | We do not believe the on site burning of wood or wood based waste is sufficiently robust for a city centre building of this size and complexity. These fuel sources have a low volumetric density and storage and handling of the fuel are expensive and complex. A Bio fuel and diesel blended fuel may be efficient and emission free at some time in the future and it would be possible to select boiler and flue plant so that it is possible to convert boiler plant to burn a bio fuel. |

ENERGY MODEL RESULTS work in progress

| | |
|---|---|
| Target | 55GJ/100cm pa |
| Model Scheme with CHP (c1.5MWe) | 52GJ/100cm pa but with design enhancements which have a good economic case as described |
| Base scheme without CHP | 66GJ/100cm pa but with design enhancements which have a good economic case as described |



POSSIBLE COMMUNITY LOW OR ZERO CARBON TECHNOLOGIES
Not adopted but may be suitable in time

| | |
|---|---|
| Community Wind Turbines | Possible but obtaining land and planning may be difficult |
| Community CHP | Mixed connected building types provide a better yearly heat & power balance than the hospital alone.<br>Potential for Community Nat Gas Fuel Cell or Turbine technology to deliver a combined heat and power scheme covering the hospital and new residential buildings. |
| Hydrogen Fuel Cell | Potential for Community Hydrogen Fuel Cell technology to deliver a combined heat and power scheme covering the hospital and new residential buildings. Mixed connected building types provide a better yearly heat & power balance than the hospital alone.<br>Opportunity to demonstrate hydrogen use for transport eg fuel cell technology bus fast link, ambulances and pool cars |

POSSIBLE COMMUNITY LOW OR ZERO CARBON TECHNOLOGIES

| | |
|---|---|
| Energy from Waste | Potential for Community Waster Recycling and Energy from waste plant to deliver a combined heat and power scheme covering the hospital and new residential buildings. Mixed connected building types provide a better yearly heat & power balance than the hospital alone. Possible but planning may be difficult.<br><br>The Scottish Water Waste Water Plant could provide a source of waste for fuel/methane gas. |

FURTHER LOW OR ZERO CARBON TECHNOLOGIES

Biomass

Biomass fuel from wood coppice, wood chips, straw, corn, hay, wood pellets, seed crops, animal waste and industrial waste can be burnt in specially designed boilers to provide heat to cover the base heating load throughout the year. Poor responsiveness to meet fluctuating loads means that it is preferable to use biomass boilers as part of a hybrid multiple boiler installation with gas boilers to take up the rest of the load.

Key Points

- A typical installation includes a storage area for the fuel, a hopper to deliver the fuel from the store to the boiler, a boiler.
- Separate flue to discharge the waste gas.
- Fuel is delivered weekly or fortnightly.
- 0.5-5% ash content by mass after burning to be disposed of by owner/manager.
- Price of fuel often dependent on local supply chain, price often subject to fluctuations.
- High maintenance costs, approximately 1% of initial capital outlay (including store).

Biomass is a very effective way to reduce carbon emissions but the client must be aware of and committed to the extra work required in the daily and yearly running of the plant. Biomass is as yet a relatively untried technology in commercial buildings and requires a large amount of maintenance and management. The supply chain is difficult to control and subject to change over the life of the installation, this is key to the operation and success of the scheme and is likely to require significant time and effort. The difficulties in setting up the supply chain could prove prohibitive to a biomass scheme. The excess space required for the plant and to store the fuel can end up being a significant extra cost pushing up the initial outlay and lengthening the payback time.

Photovoltaics

Photovoltaics (PVs) generate electrical energy from sunlight. There are three main types of photovoltaic system available and some hybrid systems:

Monocrystalline Silicon Cells

- These are formed from shards of electronically pure silicon.
- They have high costs but also have a high efficiency (14-15%).
- These perform badly under part load and very badly if any part of the array becomes shaded.
- Cost approximately £600 - £700/$m^2$.

Polycrystalline Cells

- These are formed from shards of silicon cells.
- They are still highly efficiency but are cheaper than monocrystalline cells (12-13%).
- These perform badly under part load and the output from the whole array is greatly reduced if any part of the array becomes shaded.
- Cost approximately £500/$m^2$.

Thin Film/Amorphous Cell

- These are formed by an amorphous layer of silicon being deposited on a substrate. This allows for the production of flexible/semi transparent cells (solar transmittance is approximately 10%).
- Their efficiency is the worst of the silicon PV cell types and is typically in the region of 5%.
- Although their peak efficiencies are lower than the other two, the part load efficiency is good and shading only reduces the output on the part that is shaded.
- The yearly output is often the same as for the other two types depending on the site.
- Can be used as shades to stop glare and overheating in place of brise soleil or expensive high performance glazing.
- Cost approximately £300/$m^2$.

Inverters and protection devices are required to connect the PV panels to the building electrical distribution system. Any excess power may be transferred to the grid to generate extra income, however, it is not worth over sizing the system with this in mind as the price paid for exported power is considerably lower than the cost of imported power.

The advantages of PV cells include:

- Production of clean energy.
- Highly visible, therefore excellent educational and PR value.
- Low maintenance requirements.
- Architecturally pleasing.
- May offset the cost of roof cladding.

Disadvantages include:

- May require planning permission in conservation areas.
- Long payback period.
- Risk of future overshadowing.
- PV's cell produce DC electricity which must be converted to AC.
- Low voltage output may be difficult to transmit.

Solar Thermal

Solar thermal panels, also known as solar collectors are a well established technology, generally, there are two types of panel, evacuated tube and flat panel. Both harness clean free radiant heat from the sun. Evacuated tube panels are usually more expensive but suffer less from heat loss as the panels get hotter, they are more efficient.

The advantages of solar thermal include:

- Production of clean energy.
- Highly visible, therefore excellent educational and PR value.
- Low maintenance requirements.
- Unobtrusive plumbing
- Low running costs

Disadvantages include:

- Low grade heat is produced
- Water may require softening
- Risk of future overshadowing.
- Requires an electrical pump
- Storage is required as solar source does not often match hot water requirement.

Ground Source Heat Pumps

Ground source heat pumps take advantage of the refrigeration cycle, heat stored in the ground is transferred from the ground into the building. The ground's temperature at around 2m deep remains at a steady 11ºC. In the winter this relatively high temperature can be taken advantage of. In summer, the ground may be used as a heat sink in order to prevent free cooling.

The energy stored in the ground is transferred to the building by pumping a water glycol mix around a closed pipe loop buried in the ground, where the length of the pipe depends on the buildings energy requirements. In smaller systems the pipes may be buried in trenches, for larger systems it may be necessary to place the pipes in bore holes.

Heat pumps are very efficient, a typical COP of 3, means that for every kW of electricity used in the heat pump 3kW of heat will be transferred from the ground to the building. Best efficiencies for heat pumps are achieved when the difference in temperature between the heated water and the ground are lowest. Therefore heat pump technology is especially suited to low temperature heating systems such as under floor heating

The payback on heat pumps is long because the pumps required to circulate the water are powered by electricity and the price of electricity is set to rise over the life of the installation.

Wind Turbines

A wind turbine converts wind energy into electricity, currently wind energy is one of the most cost effective methods of generating renewable power. It is possible to install small scale turbines that can operate economically in modest wind speeds. It will usually be favourable to install small scale turbines in urban areas. All modern turbines use lift as the wind blows across the blades to generate a turning force, the rotation of the axel drives a generator either directly or via a gear box to produce electricity. The renewables toolkit suggests that in order for a turbine to be economically viable an average site wind speed of 4 m/s is required. Average wind speed increases with height from the ground, also interference from ground obstructions is reduced with height. The topography in cities causes the turbulent flow of wind, which reduces the annual output of the turbines, this increases the size or number of turbines required than if the turbine was mounted offshore or in an open location.

The advantages of wind turbines include:

- Production of clean energy.
- Highly visible, therefore excellent educational and PR value.
- Good payback

Disadvantages include:

- Planning permission is required
- Noise output
- Visual impact
- Negotiation required with wildlife groups

Rainwater Recycling

A rainwater recycling system consists of collection, filtration, floatation and settlement within storage tanks and pumping either to a header tank or direct to outlets. Storage tanks should be cool and dark, usually underground and usually with a mains top up. Rain water recycling would be used for WC flushing, if this is the case than no special water cleaning will be required.
